In July, the Government approved a $40 million contract for construction of a synthetic rubber plant. With a design capacity of 42,000 tons per year, the plant was initially to use imported feedstock and later obtain material from local sources. The bulk of synthetic rubber production was to be exported, with a small amount destined for domestic tire production. Foster Wheeler Italiana S.P.A. was awarded a $12 million contract by KOC to construct a 200,000-ton-per-year asphalt plant. No completion date was announced, but output will be utilized for road construction.

A final decision as to the implementation of Kuwait's $900 million aromatics project was to be decided by KPIC. After the withdrawal of the original partner in the venture, W. R. Grace & Co. (United States), Kuwait invited Saudi Arabia, Qatar, Bahrain, the United Arab Emirates, and Oman to participate in the project. Only Bahrain expressed an interest in the Kuwaiti proposal. Annual production was to consist of benzene (284,000 tons), paraxylene (87,000 tons), and orthoxylene (60,000 tons) from feedstock of 1.3 million tons per year of straight-run naphtha produced in Kuwait.

Petroleum.—Crude oil reserves of Kuwait were estimated at 72 billion barrels at yearend. Reserves are calculated to last 70

Digitized by Google

to 85 years at the proposed production rate of 2 million barrels per day. Reserve estimates were based on data from the following producing fields: Kuwait-Burgan, Magawa, Ahmadi, Umm Gudair, Minagish, Raudhatain, Sabriyah, and Bahrah and Partitioned Zone-Walfin, South Umm Gudair, and South Fawares (onshore) and Khafji and Hout (offshore).

A new source of oil in northern Kuwait was confirmed by the completion of an exploratory well on April 30. Three additional wells were completed in the area, and drilling was proceeding on the fifth well. KOC production facilities were also under construction in the area. A deep seismic survey was planned for the Magawa-Ahmadi field area. Information derived from the survey was to be used to locate deep wells for KOC's continuing exploration program. Geological mapping of reservoirs resulted in improved interpretation of oil reservoirs and their fluid distributions. Reservoir studies based on these data have recently been completed for the Raudhatain and Burgan fields.

Production in the Partitioned Zone was shared equally by Kuwait and Saudi Arabia. AOC, the offshore concession holder, was composed of a Japanese consortium and the Governments of Kuwait and Saudi Arabia. Two oilfields accounted for the production, Hout and Khafji. The Khafji field was an extension of the Saudi Safaniya field, the largest known offshore deposit in the world.

Onshore operations in the Partitioned Zone were conducted by Aminoil (representing Kuwait) and GOC (representing Saudi Arabia). In 1977, Aminoil's concession, granted in 1948, was cancelled; all production facilities and the 144,000-barrel-per-day refinery were assumed by the newly established Government firm Kuwait Wafra Oil Co. Offshore crude oil reserves at the beginning of 1977 were estimated at 5.38 billion barrels. Reserves of the Aminoil-Getty onshore concession were estimated at 962 million barrels.

The Mineral Industry of Liberia

By Janice L. W. Jolly[1]

Liberia's 1977 mineral production consisted of iron ore, diamond, gold, cement, and refined petroleum. The contribution of the mineral export value to the nation's gross domestic product (GDP) of $697.7 million[2 3] (at current prices) was 43% in 1977. Real GDP growth was -1.6%, based on 1971 constant prices. Production of iron ore declined for the second year as world steel markets remained depressed. Liberia's first iron ore mine at Bomi Hills closed in March. The petroleum refinery remained inoperative throughout most of 1977 after the destructive fire of late 1976, and most refined petroleum needs were supplied by imports. Reversing a trend since 1973, diamond production increased in 1977, up 29% in value over that of 1976.

A new mineral policy was under study.[4] A preliminary consideration was the creation of a State mining corporation and the framework under which the Government might participate in mineral exploitation. Other considerations included direct Government participation in marketing and mineral transportation, provision for a diversified vertical integration of mineral development, a program for exploration and mineral mapping, and a program for the development of a potential petroleum industry.

The Liberian Government was requesting United Nations assistance in evaluating the gold and other mineral potential east of the Cestos River. A complete mineral survey of the area was expected to cost $3.5 million over a 3-year period. The Liberian Geological Survey also continued its mineral evaluation program in Grand Cape Mount, Grand Gedeh, Lofa, Montserrado, and Sinoe Counties, along with its participation in the phasing out operations of the Liberia Mining Co., Ltd. (LMC) concessions. Copper and lead anomalies were to be further evaluated in the Bopolu Quadrangle.

A mine inspection team was organized by the Liberian Ministry of Lands and Mines for the purpose of making regular inspections of mining concessions to ensure good mining practices, safety procedures, and preservation of the environment. The team made its first inspection at the Bong mine in December.

Under the Mano River Union agreement, Liberia and neighboring Sierra Leone were promoting economic cooperation for accelerated development. Although a full customs union was not yet in effect, progress was made toward that goal when, on November 10, Liberia implemented partially harmonized tariffs under the agreement. The initial effect of the harmonization was a rise in cost of certain imports, which was expected to contribute to increased inflation over the long term.

PRODUCTION AND TRADE

Liberia's export earnings, valued at $447.5 million in 1977, were dependent upon two principal mineral commodities— iron ore (74%) and diamond (4%). Gold was produced as a byproduct of diamond mining as well as by small-workers in alluvial diggings, but no official export or production figures were available. Total imports for 1977 were valued at $464 million.

Not only did Liberia's iron ore exports

Digitized by Google

decline in 1977, but the proceeds earned were further eroded by the progressive depreciation of the U.S. dollar. The three operating companies were producing at only 72% of the rated annual operating capacity of about 24 million tons. Iron product exports of 17.4 million tons were valued at $296.8 million for 1977, compared with 20.5 million tons valued at $331.6 million for 1976.

Liberian American-Swedish Minerals Co.-Joint Venture (LAMCO-JV) exported 8.2 million tons of iron ore in 1977, compared with 9.3 million tons in 1976. This included 774,000 tons of pellets in 1977 compared with 1,449,000 tons of pellets in 1976. Much of the ore is supplied under long-term contracts to a number of steelworks in Europe and Japan, and some of it is carried by agreement in ships owned by Gränges AB (Sweden). Malmexport AB of Sweden is the sales agent.

Bong Mining Co. (BMC) produced 15.2 million tons of crude ore, 4 million tons of concentrate, and 2.4 million tons of pellets during 1977. BMC exported 6 million tons of iron ore products, including 3.7 million tons of concentrate (sinter feed) valued at $50,800 and 2.4 million tons of pellets valued at $73,300. The 1976 shipments were 6.4 million tons, by comparison. Rohstoffhandel G.m.b.H., representing several West German steel producers, imported 2.8 million tons of concentrate and 1.4 million tons of pellets, and the Italian company Italsider S.p.A. imported 904,000 tons of concentrate and 959,000 tons of pellets. Because of lower prices and a softening of the European market, export sales were expected to be less in 1978 than in 1977.

March 31 was the final closing date for LMC's mining operations at the Bomi Hill's mine. During its last year, LMC's production totaled 386,400 tons including 150,200 tons of blast furnace ore, 118,200 tons of fines, and 118,000 tons of concentrate. Exports totaled 592,600 tons, including 201,500 tons of blast furnace ore, 201,100 tons of fines, and 190,000 tons of concentrate.

National Iron Ore Co. Ltd. (NIOC) mined 5.2 million tons of ore in 1977 and exported a total of 2,749,000 tons of blast furnace feed and fines. This compares with 2,755,000 tons exported in 1976. Shipments were made to several European steel corporations under long-term contract. Caemi International of the Netherlands was the sales agent for iron ore produced at the Mano River mine.

The value of Liberian diamond exports increased to $21.6 million in 1977 from $16.6 million in 1976 and $17.8 million in 1975. With the improvement in the world market, diamond exports were expected to maintain the upturn through 1978. Diamond production was 326,000 carats in 1977.

COMMODITY REVIEW

METALS

Copper.—The Geological Survey of Liberia was investigating two copper anomalies in the Taju Hill area. The northern zone was 6 meters wide over a distance of 1 kilometer, and the other occurred south of an area of chalcopyrite-bearing syenites. Near-surface phosphate concretions with copper and zinc were also reported. Mueller

Digitized by Google

Co. prospected this area, drilling one diamond drillhole at the northern anomaly.

Gold.—Interest in gold mining, supported by an effort of the Ministry of Lands and Mines to locate and quantify gold-bearing areas, continued to increase. Although total gold sales by Globex Minerals (Liberia) Ltd. were reported at 52.5 troy ounces valued at $4,700 in 1976 and 24.06 troy ounces valued at $2,960 in 1977, no firm overall gold production figures were available for either 1976 or 1977. All gold recovered was sold at the mining sites to jewelers or other interested buyers, many of whom were suspected of taking the gold to neighboring countries for higher prices.[5]

African Mining Partners and Azuza Mining Corp. ceased operations, but approval was granted to Preussag Metall AG to continue gold exploration associated with base metal sulfides. Trico Mining Co., with Liberian and U.S. backing, was negotiating for a gold and diamond concession in a 187,266-acre area of Grand Cape Mount County. Liberia Colorado Mining Co. (25% Liberian interests) was incorporated as a Liberian corporation in June and applied for a 128,000-acre concession in Montserrado. Carbon Mining Co. held a gold and diamond concession in Grand Cape Mount and Lofa Counties.

Heavy Minerals.—Testing of a 20-ton bulk sample shipped to Australia in 1975 was completed in 1976 by Liberia Beach Sands Exploitation Co. (LIBSEC), a Dutch syndicate, under a 25-year concession to exploit the heavy minerals between the Cestos and Cavalla Rivers. The completed test and feasibility studies were considered favorable for commercial production of rutile, zircon, ilmenite, and monazite. Problems to be overcome included the construction of all-weather roads to the separation plant that will be constructed at Greenville. The initial investigation disclosed reserves of 700,000 tons containing an average of 40% heavy minerals, including 192,000 tons of ilmenite, 33,000 tons of zircon, 12,000 tons of rutile, and 4,000 tons of monazite. Large areas of yellow, unconsolidated beach sand with a 50% heavy mineral concentration occur at depths of 6 to 9 meters as well as at the sediment surface.

The Geological Survey of Liberia continued a systematic laboratory examination of heavy mineral concentrates that was started as part of the Geological Exploration and Resources Appraisal (GERA) project conducted by the Liberian and U.S. Geological Surveys to serve as the guide for mineral exploration. The majority of samples were collected from the Gondoja area, Grand Cape Mount County; Kumgbor Area, Lofa County; and Kanweaken Area, Grand Gedeh County. The following economically significant minerals were identified: Columbite-tantalite, scheelite, chromium spinel, lead, zinc, copper and iron sulfides, gold, and magnesian ilmenite and pyrope garnet, both significant diamond (kimberlite) indicators.

A deposit of rutile, associated with ilmenite and hematite, was discovered in New Cess Area, Grand Bassa County. The Liberian Geological Survey was to make an investigation of the economic viability of this deposit.

Iron Ore.—The average price for Liberian iron ore improved slightly at yearend, but the increase was not enough to compensate for a simultaneous 9% increase in operating costs. The Liberian Government was seriously considering taking a more agressive role in iron ore marketing as a result of Brazilian ore competition and the depressed market. Liberia became a member of the Association of Iron Ore Exporting Countries (AIOEC) on January 15, 1977.

The Republic of Liberia owns 50% of LAMCO's shares, and the remaining 50% belongs to a Canadian-registered corporation, Liberian Iron Ore Ltd. (LIO). The largest stockholder in LIO is the Swedish LAMCO Syndicate, which owns 74.8% of the shares. The largest participant of the Syndicate is Gränges AB. LAMCO-JV was brought into being in 1960 by an agreement between LAMCO and Bethlehem Steel Corp. At the beginning of 1977, LAMCO-JV's assets were valued at $300 million, of which 75% was furnished by LAMCO. Gränges International Mining has the responsibility for running the operations through a subsidiary called LAMCO-JV Operating Co. About 4,000 persons are employed, of which 500 are Europeans. The ore is sold through Malmexport AB, a sales organization run partly by Gränges.

The LAMCO operation included open pit mines at the Nimba main ore body near Yekepa and at Mt. Tokadeh, an iron ore processing complex at Buchanan on the Atlantic Ocean, and a 273-kilometer connecting railroad. The high-grade Nimba itabirite deposits are located along the horse-shoe-shaped Nimba-Gbahm range. The largest deposit was the main ore body at Nimba, which was estimated to contain

Digitized by Google

150 million tons of blue hematite ore. Tokadeh and the surrounding mountains were estimated to contain 500 million tons of ore grading 40% to 55% iron. The 13.5 million tons of crude ore normally supplied by the mines each year was to yield 12.4 million tons of finished products after ore treatment at Buchanan and was to consist of 2.2 million tons of pellets, 10 million tons of fines, and 0.2 million tons of run-of-mill ore. In addition, a lumpy grade was to be produced on demand. The run-of-mine grade would contain between 6% and 22% silica.

LAMCO-JV was in the process of implementing the results of major research that involved development of a new pellet preparation process. The investment required was estimated at $12 million for the process which involved installation of wet, high-intensity magnetic separators instead of reversed flotation for upgrading of the finest Nimba ore fractions into pellet feed. The new process was to eliminate many of the operation problems caused by the heterogeneity of the ore body.[6] One of the problems was the expected sharp increase in silica content of the Gbahm ore in the classifier overflow, predicted after 1979.

During 1977, BMC completed its second pellet plant. The new facilities expanded production capacity to a total of 7.5 million tons, including 4.8 million tons of pellets and 2.7 million tons of sinter feed. The second grate-kiln pellet plant started up November 28, with an annual capacity of 2.4 million tons. An 11th line was added to the concentrator, and a concentrate blending system and flotation plant for pellet feed recovery were also included as part of the new facilities. The pellet feed was blended by the system from two stockpiles, each able to feed the plant for a week. The finely ground product passes through the new flotation plant where the silica is removed. Three new 9-megawatt generators were added during 1977, increasing installed electrical capacity from 68 megawatts to 95 megawatts.

LMC ceased mining operations in March. It was Liberia's first iron ore producer, and in its almost 26 years of mining activity, about 46 million tons of iron ore was produced from the Bomi Hills mine. The Liberian Geological Survey completed a study and estimation of the ore remaining at Bomi Hills. A feasibility study for reactivation of mining was also completed by the Liberian Bureau of Mines. It was estimated that 1.8 million tons of direct-shipping ore (66% iron), 43 million tons of 40% iron, and 20 million tons of other ore were dumped near the main pit area, and that the mine might be able to operate economically for another 4 to 6 years. Negotiations were proceeding between the Government and LMC to determine ownership of the assets at Bomi Hills.

To improve recovery, NIOC planned modification to the ore mill in 1978 and 1979; the cost was estimated at $1 million. Total operating costs for 1977 were $16.1 million, 57.4% of which was for materials and supplies. No additions to productive capacity were made in 1977, and output was adversely affected at Mano River by a record high rainfall. In addition to the takeover of the LMC railroad, NIOC was also required to operate the LMC water system and powerplant, pending the final takeover by the Government.

Mifergui-Nimba Co. (owned 50% by the Guinea Government and 50% by other interests including the Governments of Liberia, Nigeria, and Libya; Sonarem of Algeria; Nichimen Co., Ltd., of Japan; Instituto Nacional de Industria, Cia. Minera de Sierra Menara, and Cofei of Spain; Mineralimportexport of Romania; and Solmer and Usinor of France) had not yet settled the question of how much LAMCO was to charge for transporting the Mifergui ore from Guinea's iron ore deposits at Mount Nimba. Following a basic agreement in 1976, LAMCO had started negotiations in 1977 for a more definitive contract to carry out its transportation obligations. About $100 million would be needed to construct the rail extension from Nimba to Mifergui, buy rolling stock to carry the ore, build additional rail sidings, and undertake expansion of rail terminal and port facilities at Buchanan. It was estimated that Mifergui ore would be exported through the port of Buchanan beginning sometime in 1982.

Disputes during 1977 over European participation in the Wologisi iron ore project were casting doubts on the future of the project and progress toward eventual exploitation. Liberian International American Corp. (LIAC), the parent company of Liberia Iron and Steel Co. (LISCO), had worked out a plan to speed up exploitation, but several participants voted against it. This left intact the plan to develop a 10-million-ton-per-year pellet plant.

Tungsten.—Two geological teams of the Liberian Geological Survey continued field investigations of the scheelite minerali-

Digitized by Google

zation in the Gondoja area. Examination indicated a possible extension to the Sam Davis Creek pegmatite that contains scheelite. Associated minerals were rutile, base metal sulfides, magnetite, apatite, quartz, and sericite.

Uranium.—Western Enterprises Inc., a subsidiary of Coastal States Gas Corp. of Houston, Tex., was granted a uranium mining concession. The agreement covers an area of 25,000 square miles in Sinoe, Grand Gedeh, Nimba, and Lofa Counties and in Bomi Territory. Under the agreement, the company was to assign all obligations and rights to a Liberian corporation, CLU Enterprises Inc., in which 25% of the shares was to be reserved for offer to Liberian citizens. CLU was to be exempt from income tax for 5 years and also from import duties for equipment and supplies for a limited period. CLU will pay a royalty of 4% on all uranium produced and sold and a royalty ranging from 4% to 6% on all other minerals produced. In addition, the company was to pay rentals of $2.50 to $10.00 per square mile for land included in the exploration area and was obligated to spend $3.75 million over a period of 5 years. Exploration was to begin in the Nimba area.[7]

Airborne radiometric surveys by the U.S. Geological Survey indentified a number of favorable anomalies. The best target areas for future uranium exploration were describod as along the edges of iron formations.

NONMETALS

Barite.—Barite reserves at Gibi were estimated at approximately 1 million tons; further drilling would be required for more accurate estimates. Lofa Construction Co. applied for additional exploration time in 1976. Senwein Mining Corp. also applied for exploration rights at Gibi.

Cement.—Cement was produced by Liberia Cement Corp. of Bushrod Island, Monrovia. The brand name is Blue Star cement, which is a finished portland cement (105 ASTM C-150). A total of 108 persons were employed by the plant.

Chrysoberyl.—A commodity report entitled "Chrysoberyl in Liberia" was completed and released as Liberian Geological Survey report MR-83. Chrysoberyl has been reported in panned concentrates from gravels of the Lofa River basin. This study reported on the economic potential and occurrences of this mineral.

Diamond.—Globex had a diamond concession on the Lofa River in the alluvial deposits. Diamond sold by Globex in 1977 totaled 213 carats valued at $12,507. During 1977, Globex worked two areas, Jawajai and Gbene on the Lofa River. Exploration was being carried out between Jawajai and Go Home. West Africa Consultants was surveying Globex concession boundaries. Kimberlite pipes at Kano Godua were reportedly not diamond bearing, but further testing was recommended. The Diamond Appraisal Office continued to be operated by Diamond Corp. of West Africa, a subsidiary of De Beers Consolidated Mines Ltd. of London. A second Liberian trainee was sent to London for a 2-year course in diamond appraising.

Fertilizer.—Fertilizer use was actively encouraged by the Liberian Government, and demand was increasing. Fertilizer consumption was about 10,000 to 15,000 tons per year. A fertilizer plant was under consideration.

Stone, Crushed.—Efforts were made to increase crushed rock output from the Noway quarry at Mano River. Production in 1977 was 32,000 tons compared with 2,900 tons in 1976. The rock was used to upgrade mine haulage roads by NIOC.

MINERAL FUELS

Petroleum.—Negotiations for the purchase and takeover of the Liberia Refining Corp. (LRC) 15,000-barrel-per-day refinery at Monrovia continued throughout the year. Claims of expropriations[8] were being made by LRC after difficulties in negotiations with the Liberian Government occurred. The Government denied these charges, and by yearend, negotiations had resumed. LRC was owned 67% by Sun Trading and Marine Transport Inc., 18% by Dynalectron Corp., and 15% by Liberian interests, including 1.9% by the True Whig Party.

The Liberian Government was considering starting a detailed investigation of onshore and offshore areas for petroleum. The Romanian Government had indicated an interest in reinterpreting previous seismic data collected and doing geological and geophysical surveys of the Roberts and Bassa Basins. The Romanian company ROMPETROL submitted a proposal for a $3 million hydrocarbon exploration project.

The Mineral Industry of Libya

By T. John Rowland, Jr.[1]

Petroleum and natural gas continued as Libya's most important mineral commodities during 1977. Libya possessed 4.7% of the world's crude oil reserves at yearend and accounted for 3.5% of 1977 world production. Libyan exports for 1977 were valued at $10.5 billion,[2] of which 99% was contributed by petroleum revenues.

In October, National Oil Corp. (NOC) announced its plans for future Libyan oil production. Under the current 5-year plan (1976-80), Libya plans to produce an average of 2.4 million barrels per day in 1978 and 2.7 million barrels per day by 1980. The future production rates were scheduled with consideration for the development of new fields, production declines at some existing fields, conservation regulations, and economic factors.

Czechoslovakia and Libya signed a trade agreement in June under which Libya was to export oil to Czechoslovakia in exchange for tractors, agricultural equipment, compressors, metallurgical products, and clothing.

The U.S.S.R. contracted for the construction of a 440-megawatt nuclear powerplant in Libya. Under the terms of the contract, the U.S.S.R. will construct the plant and Finland will design and construct the emergency cooling system. The plant will be Libya's second nuclear reactor and its first commercial nuclear powerplant.

A $445 million contract was let to a West German company to build a steam power station 78 miles east of Tripoli at Homs. The station will generate electricity and desalinate 40,000 cubic meters of seawater per day. The project, to be completed by 1980, includes a 220-kilovolt transformer station, warehouse, workshop, and port.

Libya's roadbuilding program progressed during 1977. Epiritoki Co. of Greece was awarded a contract for $423 million to construct a total of 435 miles of roads on two north-south, trans-Saharan routes. The longer route will provide a 603-kilometer link between Jalo and Kufra in the eastern part of Libya; in western Libya, a 97-kilometer road will extend from Ghariar to Brak.

PRODUCTION AND TRADE

Libyan crude oil production totaled 753 million barrels during 1977, compared with 707 million barrels in 1976. Producing oil wells numbered 1,030 at yearend 1977, an increase of 55 over those of yearend 1976. Libyan oil production remained the second largest in Africa, closely following that of Nigeria. Cement production increased as a result of the opening of new plants. Other mineral production included small amounts of brick, gypsum, lime, sand and gravel, and crushed and dimension stone.

Crude oil and natural gas dominated Libya's mineral exports in 1977. Exports of crude oil increased 12.3% during the first half of 1977 to nearly 2 million barrels per day. Western Europe's share of Libyan crude oil exports declined from 55% in 1976 to 47% in 1977, while that of the United States increased from 27% to 40%. Exports to Japan decreased 59% in 1977.

COMMODITY REVIEW

Cement.—Cement production in 1977 totaled 2.5 million tons, a substantial increase over the 95,000 tons in 1970. During 1977, the production capacities of the cement factories at Benghazi and Homs were increased to 1 million tons and 440,000 tons per year, respectively. In June, a 1-million-ton-per-year plant was opened at Suk el Khamis to supply the building requirements of Tripoli. Construction of another 1-million-ton-per-year plant at Benghazi was near completion, with production scheduled for early 1978. Libya reached 90% self-sufficiency in cement production in 1977.

Gypsum and Salt.—A $3 million contract was signed with an unidentified firm to provide consulting services for a large chemical complex at Marada. Annual production capacity is to be 30,000 tons of magnesium, 27,000 tons of sodium chloride,

Digitized by Google

19,000 tons of potassium chloride, and 8,000 tons of gypsum.

Iron and Steel.—Dastur International of India completed a feasibility study for an iron and steel complex at Misurata, located 200 kilometers east of Tripoli. The first phase of the plant was scheduled for completion in 1980 with an annual capacity of 1 million tons of steel. The direct-reduction-process unit was to be fueled by domestic natural gas. The Wadi Shati iron ore deposit, with estimated reserves of 2 billion tons, will be mined to supply the ore. Other facilities included a steel-melt shop, casting plant, bar and rod mill, light- and medium-section mill, semicontinuous hot strip mill, and cold-rolling mill.

Natural Gas.—Libya's natural gas reserves, estimated at 28,500 billion cubic feet at yearend, were the third largest in Africa, exceeded only by those of Algeria and Nigeria.

Elf-Aquitaine (France) discovered a large natural gas deposit in the Zuara offshore concession west of Tripoli. Commercial evaluation of the deposit was to be undertaken in early 1978. By yearend 1977, a 272,000-ton-per-year nitrogen ammonia plant at Marsa el Brega was to be completed, with production scheduled for early 1978. The plant was designed and constructed by Friedrich Uhde GmbH of the Federal Republic of Germany. The output of the plant will be exported until a urea production unit is completed.

A gas-gathering system was planned to supply feedstock and fuel for the Marsa el Brega liquefied natural gas plant and petrochemical complex. The system was also to distribute natural gas to the projected steel complex at Misurata.

Petroleum.—Libyan crude oil reserves, the largest in Africa, were estimated at over 25.3 billion barrels, an increase of 3.4% over the 1976 level.

Eight groups of companies operated in Libya in 1977 under production-sharing agreements with the Government. The most active firms were Occidental of Libya Inc. (Oxylibya) and Oasis Oil Co. of Libya.

Three new fields in the southwestern section of the Sirte basin were to be developed by Oxylibya. The project was expected to contribute an additional 75,000 barrels per day to Sirte basin production. Under the production agreement, ownership will be shared by the Government (81%) and Oxylibya (19%). Worley Engineering Inc. of Houston, Tex., was awarded a $120 million contract by Oxylibya for construction of 183 kilometers of 16- and 20-inch pipelines and facilities for the three fields.

Elf-Aquitaine reported two oil discoveries along with a large gas discovery west of Tripoli in the Zuara offshore area. Commercial development was expected to begin in 1978. Mobil Oil Libya Ltd. announced a number of onshore discoveries, with plans for exploitation at a rate of 100,000 barrels per day.

The largest expansion project was undertaken by Government-owned Arabian Gulf Exploration Co. (AGECO) in Sarír and Mussala fields in eastern Libya. Capacity at Sarír field was to be increased to 600,000 barrels per day and that at Mussala field to 400,000 barrels per day.

NOC increased the capacity of the Záwiyah refinery from 60,000 barrels to 120,000 barrels per day, completing the second phase of a three-phase expansion that is to increase capacity to 180,000 barrels per day. Built by Italy's Ente Nazionale Idrocarburi (ENI) at a cost of $38 million, the Záwiyah refinery has processed over 41 million barrels of crude oil since opening in September 1974. Construction of a new 220,000-barrel-per-day refinery at Tobruk continued, with completion scheduled for 1979. The refinery is to process crude oil from Sarír field. Refinery products, with the exception of naphtha, will be exported from the terminal at Marsa el Brega; naphtha is to be used for local ethylene production at a planned 1,000-ton-per-day ethylene plant.

The Government agreed to compensate Texaco Inc. and Standard Oil Co. of California for the 1973-74 nationalization of their subsidiaries. The International Court of Justice at The Hague administered the arbitration decision, which stipulated that the subsidiaries, Texaco Overseas Petroleum Co. and California Asiatic Petroleum Co., were each to be reimbursed with Libyan crude oil valued at $76 million.

Arab Petroleum Services Co. (APS) was founded in early 1977 by the 10-member Organization of Arab Petroleum Exporting Countries (OAPEC). Libya was the largest stockholder, with 17% interest in the Tripoli-based firm. Among the objectives of APS was the education and training of Arab nationals in all facets of the petroleum industry for employment in APS subsidiary and joint venture companies.

The Mineral Industry of Madagascar

By David E. Morse[1]

Madagascar's economy grew at a rate of 1.2% in 1977 with the gross domestic product (GDP) reaching $1.8 billion.[2] The mineral industry of Madagascar continued to be a small contributor to the nation's primarily agrarian economy but a significant source of foreign exchange during 1977. Madagascar's major mineral products in 1977 were chromite and graphite. Small-scale operations produced a wide variety of semiprecious and ornamental stones including agate, amazonite, celestine, cipoline, jasper, rhodenite, quartz (rose, smoky, and amethystine), tourmaline, and zircon. The island contains large resources of bauxite, chromite, coal, lateritic iron and nickel, limestone, graphite, mica, piezoelectric quartz, rutile, and zircon.

The Government-owned petroleum refinery at Tamatave processed imported crude oil to supply the island's petroleum product requirements. Small private companies produced cement, brick, and glass utilizing domestic mineral resources.

The Mines and Geologic Department was reorganized into five separate divisions in 1977: The Mining Property Division, the Promotion Division, the Geological Division, the Drilling Division, and the Studies, Technical and Documentation Division. The Government has stated that it would own 51% or more of all new mining ventures.

PRODUCTION AND TRADE

Production data are shown in table 1. The major mineral exports were chromite, petroleum products, and graphite. Major imports were crude oil, metal products, cement, and rice during 1977. Trade in mineral commodities is detailed in tables 2 and 3.

COMMODITY REVIEW

METALS

Chromite.—Madagascar began significant production of chromite in 1969. During 1977, Kraomita Malagasy, a Government-owned enterprise, operated the nation's only chromite mines at Andriamena and Befandriana Nord. Chromite production decreased significantly in 1977 from the record high output of 1976 but represented the third highest output since 1969. The Government planned to build a 30,000-ton-per-year ferrochromium plant scheduled to come on line in 1982 and use power from the Rogez-Andekaleka hydropower scheme.

Iron Ore.—A program of drilling, prospecting, and chemical analysis was conducted on the Soalala iron ore deposits during 1977. The deposits, located near the western coast 150 kilometers south of Majunga, were estimated to contain 300 million tons of ore.

Nickel.—No progress toward developing the 120-million-ton lateritic nickel deposit at Ambotavy near Moramanga was reported in 1977.

Other.—Beach sand deposits containing zircon, ilmenite, monazite, and rutile have been investigated on the eastern coast near Tamatave and near Fort-Dauphin. Montedison S.p.A. of Italy set up a pilot plant south of Tamatave to recover ilmenite, zircon, and monazite using gravity separation.

NONMETALS

Cement.—During 1977, Madagascar's only cement plant at Amboanio near Majunga operated at 87% of rated capacity. To combat the island's shortage of cement, the Government investigated several sites near Tuléar, Antsirabé, and Moramanga for the construction of a new cement plant. Expanding the Amboanio facility was also under study.

Gem Stones.—A wide variety of gem, semiprecious, and ornamental stones was produced by small-scale operations during 1977. The more important products were beryl, garnet, amethyst, moonstone, tourmaline, and agate.

Graphite.—Madagascar has produced and exported graphite for 70 years with total production amounting to slightly over 900,000 tons since 1907. The industry has

Digitized by Google

remained essentially unchanged for the past 20 years. The 1977 output of 15,700 tons was 9.7% less than the 1976 output. Any change in production will be dependent on what the Government decides concerning its level of participation in the graphite mining industry. During 1977, production came from six privately owned family operations.

Mica, Phlogopite.—The mica industry of Madagascar was centered in a triangular region in the southern part of the island near Fort-Dauphin. In 1977, mica production recovered from the poor showing recorded in the previous year. Output of high-quality block and splittings, however, remained depressed.

MINERAL FUELS

Petroleum.—No petroleum exploration activity was conducted in Madagascar during 1977. The only rightsholder at yearend was Oceanic Resources Ltd. in two offshore blocks totaling 76,250 square miles. Hunting Geology and Geophysics Ltd. of the United Kingdom conducted aeromagnetic surveys in the Fort-Dauphin and Majunga areas for the Government. The Tamatave petroleum refinery processed 491,000 tons of imported crude oil during 1977, a 6% decrease from that of 1976.

The Mineral Industry of Malaysia

By E. Chin[1]

The Malaysian gross national product (GNP) in 1977 was $12.2 billion[2] in current market prices, compared with $10.8 billion in 1976. In terms of constant 1970 prices, the GNP in 1977 was $8.2 billion, a real growth of 8% over that of 1976. The gross domestic product (GDP) in 1977 was $7.4 billion in 1970 prices and was distributed by sector as follows, in millions: Agriculture, forestry, and fishing, $2,111; manufacturing, $1,203; wholesale and retail trade, $973; public administration and defense, $580; banking, insurance, and real estate, $524; transport, storage, and communications, $508; mining and quarrying, $351; construction, $340; electricity and water services, $192; and other, $606.[3] Most sectors of the economy experienced further growth over that of the previous year. The agriculture, forestry, and fishing sector grew only 1.3% in 1977, largely as a result of weaker demand for sawn logs and sawn timber. Growth in the mining and quarrying sector was 8.3% in 1977 because of a fairly large increase in crude petroleum output.

The construction and manufacturing sectors showed increases of 12% and 16%, respectively. Construction was buoyed up by demand for residential housing and by public sector investments in infrastructure. The growth in the manufacturing sector resulted from increased domestic spending and increased export demand for locally produced goods.

As reflected by the consumer price index (CPI), inflation in 1977 accelerated about 4.5% compared with 2.2% in 1976. The increase in the CPI was chiefly a result of higher cost for food, rent, fuel and power; clothing and footwear; and medical and health expenses.

Total employment in 1977 was about 4.2 million, compared with a total available labor force of 4.5 million. The slowdown in economic activity in 1977 resulted in a lower rate of new jobs created during the year. The majority of jobs continued to be provided by the agriculture, forestry, and fishing sector, which employs 44% of the labor force.[4] New jobs in these industries collectively increased only 1.3%, although conditions were buoyed up by higher prices for rubber and a general upswing in the timber industry. New jobs in manufacturing increased 12% in 1977; public administration and defense 6.5%; wholesale and retail trade 5%; transport, storage, and communications 4%; and construction 3.9%.

Employment in the mining and quarrying sector increased only 0.4% as a result of declining production from mines. However, the growing importance of petroleum was expected to offset the decline in output in the tin industry. At yearend, 39,753 persons were employed in the mining industry. Tin operations were by far the largest, employing 38,474; followed by bauxite, 239; iron, 222; and other, 818. Employment data in the oil industry were not available. At yearend, there were 874 individual operating units mining tin (784 gravel pumps, 53 with dredges, 37 with other means), 12 for gold, 11 for china clay, 6 for iron ore, and 1 for bauxite.

There was a marked reduction in labor-management disputes in 1977 compared with 1976. During the year, 28 strikes involving 5,905 workers resulted in the loss of 55,679 man-days. As in previous years, the manufacturing sector had the largest number of strikes. During the year, 94 collective agreements were signed in the private sector. The largest number of agree-

Digitized by Google

ments (49) were signed in the manufacturing sector and the least (2) in the mining and quarrying sector. The average increase in wages covered by the agreements, by industry, was as follows: Manufacturing and services 17%, agriculture 16%, commerce and transport 13%, and mining 12%.

The exchange rate of the Malaysian ringgit to all major currencies except the Japanese yen strengthened during the year. Vis-à-vis the U.S. dollar, the ringgit's position improved significantly owing to the weakened dollar as reflected by U.S. inflation and a widening deficit in the U.S. trade account. The ringgit appreciated 2.3% in the first quarter, from M$2.5334=US$1.00 at the beginning of January to M$2.4760=US$1.00 on April 8. It weakened slightly in late April, recovered its position by July, and then depreciated slightly (0.4%) in August, owing to substantial commercial exchanging of the currency for U.S. dollars, particularly by oil companies operating in Malaysia. On the whole, the ringgit showed an appreciation of 3% against the U.S. dollar.

PRODUCTION[5]

By value crude petroleum was Malaysia's most important mineral commodity. In 1977, total industry output by the three producing companies, Exxon Production Malaysia, Inc., Sarawak Shell Bhd., and Sabah Petroleum Co. Ltd., averaged close to 185,000 barrels per day. During the year, the average price for Malaysian crude petroleum (Miri light crude, Labuan crude, and Tembungo crude) was $14 per barrel, f.o.b. However, the crude oil output was small by world standards, constituting less than 1% of total world output. Malaysia is the world's largest producer of tin, accounting for about 25% of world mine production. Production of tin-in-concentrates during the year was almost 1.3 million piculs, averaging about 75% tin. Under the Fifth International Tin Agreement, the price per picul was raised from $430 to $480, effective July 15, 1977. In addition, there are two large tin smelters—Butterworth and Penang. Production of tin-related minerals included significant quantities of ilmenite, zircon, and monazite. Small quantities of columbite, gold, scheelite, tantalite, wolframite, and xenotime were also produced as byproducts of tin-mining operations.

Output of bauxite continued to decline owing to the lower tenor of ore and gradual depletion of deposits as well as reduced demand by foreign markets. Mine copper was produced at the Mamut mine in Sabah. Malaysia also produced small quantities of antimony, manganese, barite, and kaolin. The average production of associated natural gas from petroleum production was estimated at 352 million standard cubic feet per day. However, only 20% of the gas is utilized, and the remainder is simply flared.

[e]Estimate. [p]Preliminary. [r]Revised.

[1]All production is from West Malaysia unless otherwise indicated.

[2]In addition to the commodities listed, a variety of crude construction materials (clays, sand, gravel, stone, salt, and fertilizer) are produced, but production is not reported and available information is inadequate for the formulation of reliable estimates of output levels.

[3]Estimates based on exports of copper concentrates.

[4]Based on export figures.

[5]Includes small portions of tin from smelter in Singapore.

[6]Includes production from Sarawak and West Malaysia.

TRADE[6]

The total value of Malaysia's two-way trade in 1977 was estimated at $10.5 billion (exports, $6.0 billion, and imports, $4.5 billion). By industrial trade classification, Malaysia was a net importer of food, beverages and tobacco, chemicals, and machinery and transport equipment. The country was a net exporter of inedible crude materials, mineral fuels, animal and vegetable oils, and manufactured goods and articles.

Malaysia's export markets, by area, in 1977 were as follows, in billions: The European Economic Community (EEC), $1.2; other Western European countries, $0.1; Eastern European countries, $0.2; the Association of Southeast Asian Nations (ASEAN), $1.2; other Asian countries, $2.0; Australia and New Zealand, $0.1; North America, $1.1; Africa and South America, $0.04 each; and other countries, $0.01. Imports by major area were, in billions: EEC, $0.8; other Western Europe, $0.9; ASEAN, $0.7; and other Asian countries, $1.9.

Malaysia's leading export commodity was rubber, valued at $1,352 million; followed by timber materials, $999 million; crude petroleum, $763 million; crude and refined palm oil, $727 million; and tin and tin-in-concentrates, $681 million. Copper concentrates exported during the year were valued at $34 million and refined petroleum products at $81 million.

Malaysia currently accounts for about one-fourth of the world's production of tin. Tin accounts for about 90% of the value of all Malaysian mineral exports, excluding petroleum. The United States, Japan, and the EEC were the major markets for Malaysian tin, consuming collectively about 80% of total Malaysian tin exports. Other mineral exports included bauxite, copper concentrate, ilmenite, iron ore, and manganese ore. The bulk of these exports went to Japan.

COMMODITY REVIEW[7 8]

METALS

Aluminum.—Bauxite was mined at Telok Ramunia in Johore State by Southeast Asia Bauxites Ltd., a subsidiary of Aluminum Co. of Canada Ltd. (Alcan). Annual mine output has decreased from the 1-million-ton level during 1969-73 to about two-thirds of this in 1977 owing to lower grade ore rather than to decreased export demand. Ore reserves at Telok Ramunia were estimated to be about 10 million tons. Because Malaysia lacks smelter facilities, its bauxite production is exported to Japan, as in previous years.

Because of increased costs for energy, large companies such as Reynolds Metals Co. of the United States, Aluminum Péchiney of France, and Hyundai Heavy Industries of the Republic of Korea were interested in establishing aluminum reduction facilities in Malaysia. The Sabah and Sarawak State governments have been negotiating agreements to study the feasibility of constructing smelter facilities at Labuan Island and Bintulu, respectively. Because of increased oil production, large amounts of associated natural gas were simply flared from Malaysia's offshore oilfields rather than being utilized. A smelter at Labuan Island would use natural gas for generating electric energy, inasmuch as the island serves as the supply base for oil operations in Sabah. An aluminum smelter in Sarawak might initially use natural gas from the Bintulu field but would eventually use hydropower from the Rajang River.

Bauxite has been discovered at eight locations in Sabah, although the grade and extent of the deposits remain undetermined. Sarawak has proven reserves of bauxite, but they are too small to supply the requirements of a 100,000-ton-per-year smelter. It was expected that alumina could be produced from locally mined and imported bauxite. If viable, the natural-gas-fed Sabah project could be completed in about 3 years, compared with the 7 to 10 years required to complete the hydroelectric-power-based Sarawak project and its associated infrastructure.

Copper.—Production of copper concentrate (grading 28% copper) from the Mamut porphyry copper mine in Sabah, managed by Overseas Mineral Resources Develop-

Digitized by Google

ment, increased from 78,000 tons in 1976 to close to 100,000 tons in 1977. Mamut has reserves estimated at 196 million tons of dioritic porphyry ore grading 0.576% copper. Mine output capacity was rated at 16,000 tons of ore per day, with the associated mill capacity rated at 30,000 tons of contained copper per year. The concentrate is transported by dump trucks to Usukan Bay, 115 kilometers northwest of the mine-mill site, and then shipped to Japan for smelting and refining.

Iron Ore.—Since the closing of the Bukit Ibam mine at Rompin in 1970, mine production of iron ore has declined to about 300,000 tons in recent years. Total output in 1977 was 328,000 tons, an increase of 6% from that of 1976. Iron ore was mined from relatively small deposits by six operations in Pahang, Johore, Perak, and Kedah States, all of which are in Malya. Production in Pahang accounts for about one-half of the total output. Although deposits of high-grade ore exist in Malaysia, none contain sufficient reserves to support profitable mining.

Tin.—Malaysia was the world's largest producer of tin-in-concentrate and refined metal, as well as the world's largest exporter of tin. Output of tin-in-concentrate totaled 58,703 tons in 1977, representing a decline in annual production for the fifth consecutive year. Production of tin metal was produced by the Butterworth and Penang smelters.

At yearend, there were 874 active tin operations in the country, which included 53 using dredges (mainly in Perak and Selangor), 784 using gravel pumps and 37 hydraulic, opencast, and underground mining operations. At yearend 1976, there were 51 dredges, 724 gravel pumps, and 36 other operations. Dredging accounted for 35% of total output; gravel pumping 51%; and hydraulic, opencast, and underground mining operations, 14%.

Output of tin-in-concentrate in 1978 was projected to remain at the same level as in 1977. Higher prices for tin were not expected to be a sufficient inducement for higher production. The principal problems facing the industry were lower yield in existing operating areas, higher costs, administrative difficulties, and a heavy tax burden.

The productivity of gravel-pumping operations was presently estimated at 0.2 kati (or catty[9]) of tin ore per cubic yard, compared with 0.25 kati in the 1960's. About 90% of the gravel-pumping operations (88% of which are located in Perak and Selangor), were previously mined working areas. Dredging operations had even lower productivity, yielding 0.1 to 0.2 kati per cubic yard, compared with 0.2 kati in the 1960's. Between 1974 and 1976, the cost of power rose 14.5% for pumping operations and by 5.5% for the dredging sector. The cost in salaries for both types of operations increased 7.8%. Also, the tin industry charged that it was having difficulty obtaining new mining lands from the State Governments and in renewing mining leases and prospecting licenses.

Total employment in the industry declined from 39,736 in 1975 to 36,828 in 1977 owing to the closure of marginal mines. However, by yearend, employment reached 38,474, mainly because 60 additional gravel-pumping units came into operation during the year. Of total employment, 23% was in dredging operations, 63.5% in gravel-pumping operations, and 13.5% in opencast and underground mining operations.

Tin producers pay several direct and indirect taxes such as export duty and surcharge, tin profit tax, and income tax. Producers attributed the higher cost of production mainly to the heavy tax burden. The States of Malaysia Chamber of Mines estimated that about 70% of the gross profits from tin sales is taken by various taxes, of which 30% were for export duty and surcharge alone. To encourage further investment in the industry, the Government was reviewing the tin tax structure. As a first step, the import duties on stationary diesel engines and water pumps were reduced to 10% from 25% and 30%, respectively. The Government proposed the introduction of a new national mining code, which would standardize and streamline procedures governing prospecting, alienation, issue and renewal of leases, conversion, and other matters. Both State and Federal Governments were to agree to the formulation and implementation of the policy guidelines and on the advisement of the National Land Council; the State Governments could adopt the code for local implementation in their respective states.

The Federal Government continued to encourage Malaysian equity sharing in the industry. In 1976, Pernas Securities, through its wholly owned subsidiary Tradewinds Sendirian Berhad, purchased 71.35%

Digitized by Google

of the shares held by London Tin Corp., the company that accounts for about 28% of the tin output in Malaysia. In 1977, the Government disbursed $68 million in loans to Pernas for purchasing shares in major foreign companies including Har Par, London Tin, and Sime Darby, to be held in trust for the Bumiputras (Malaysians regarded by the Government as of indigenous ethnic origin). At the beginning of 1977, 33 mines were operated by Bumiputras and 25 mines were joint ventures with non-Bumiputras. These mines were mainly gravel-pumping operations producing 4 to 7 tons of tin concentrate per month. In June 1977, the domicile of Malayan Tin and Kamunting Tin Dredging Ltd. was transferred from the United Kingdom to Malaysia. The process of transferring the domicile of Southern Kinta Consolidated and Southern Malayan Tin Dredging Ltd. was also expected to be completed during the year.

The Malaysian Mines Department was carrying out prospecting in Malay Reservation Areas to locate and evaluate potential new tin deposits in the country. About 393 hectares of Malay Reserves were to be prospected in 1977, and 290 hectares were earmarked for evaluation in 1978.

A feasibility study on establishing a Tin Exchange in Kuala Lumpur was being carried out by the Ministry of Primary Industries. A preliminary draft of the report was completed on establishing an exchange as part of the overall program to set up a multicommodity exchange dealing with the country's exports of major primary products such as tin, rubber, and palm oil. If the plan is implemented, Kuala Lumpur would become an important terminal market for Malaysia's major export goods.

Titanium.—A major mineral obtained as a byproduct of alluvial tin mining is ilmenite, an iron-titanium oxide. Malaysian ilmenite assays about 53% TiO_2, but higher grades (up to 65% TiO_2) have been recovered at Sungkai in Perak and at Petaling in Selangor. Production of ilmenite, all from Malaya, totaled close to 154,000 tons in 1977.

Malayan Tin Smelting and Finance Co. Sdn. Bhd. began operating its new titania plant at Lahat, using local ilmenite as a raw material. However, plant operations were discontinued near the end of the third quarter of 1977. The closure was reportedly owing to technical difficulties in the acid leach process, which yielded a lower quality synthetic rutile.

Other.—Recovery of other metals from tailings of dredging operations included columbite, scheelite, zircon, and two rare-earth minerals, monazite and xenotime. Small quantities of wolframite concentrate were recovered as a byproduct of alluvial tin operations; however, the major source of tungsten production in Malaysia was a wolframite lode in Pahang. Gold was recovered as a byproduct of tin-dredging operations at Batang Padang District and Kuala Lumpur, and from small-scale mining operations in the Raub and Bau District in Sarawak.

NONMETALS

Cement.—Malaysia's value-added in the construction sector increased 11.8% in 1977 as a result of the stimulus of increased residential and public sector building projects. Domestic resources of limestone and sand and gravel are abundant and ensure a readily available supply for the construction industry. Cement production in 1977 was about 1.7 million tons. Price increases are subject to approval by the Ministry of Trade. The price of cement, however, remained stable in 1977 at about $3 per kilogram bag. On a nationwide basis, total supply was adequate to meet demand; locally, cement production outstripped demand by 20% in Malaya but lagged behind demand by about 17% in Sabah and Sarawak.

Malaysia's largest cement producer was Tasik Cement Bhd. in Ipoh, which has an annual output capacity of 1.04 million tons. Other cement producers in the country were as follows, with capacity expressed in thousand tons per year: Associated Pan Malaysia Cement Sdn. Bhd., 900; Cement Industries of Malaysia Sdn. Bhd., 400; and Malaysia Industrial and Mining Corp. Bhd., 60.

Associated Pan Malaysia Cement was considering constructing an additional facility to supplement the output of its Rawang works, thereby increasing its capacity to 1.2 million tons per year. Final plans were expected to be formalized in 1978. In 1976, the Government approved additional cement projects, Siemen Perak Sdn. Bhd. and Pahang Cement Sdn. Bhd. By the end of 1977, construction on these projects had not been initiated.

Fertilizer Materials.—During 1977, domestic production of nitrogenous, phosphatic, and potassic fertilizers totaled 290,000 tons. Three of the more than 20 producing

Digitized by Google

companies accounted for about 35% of the total output. To meet the domestic demand for fertilizers, about 400,000 tons of fertilizers was imported in 1977, consisting mainly of potassic fertilizers (45%); urea (21%); and composite, complex, and compound fertilizers (19%). The major suppliers of fertilizer materials were Christmas Island, Canada, the Federal Republic of Germany, Japan, and the United States.

To maintain fair and reasonable prices for fertilizers, the Government introduced subsidy schemes and also included fertilizers in the essential commodities list under the Control of Supplies Regulations in 1974. In addition, import duty exemptions were granted on all types of imported fertilizers except those produced locally; on these, a protective import duty of about $18 per ton was levied. The import duty exemptions were expected to result in a loss of Federal revenue of only about $1.2 million in 1977.

Domestic demand for fertilizer was expected to increase at an annual rate of 3%. Domestic production was projected to increase 9% in 1978 to 313,900 tons, and imports were expected to decrease 2%. The Government was planning to participate in fertilizer manufacturing, especially in the production of urea. A feasibility study on a urea project assigned to Malaysia under the regional industrialization scheme of the ASEAN was initiated in September 1976 and was to be completed in late 1977.

Other.—The major producing states for crushed rock were Selangor, Johore, Pahang, and Perak. Crushed granite, most of which was used for road metal and concrete aggregate, constituted 68% of total production. The remainder was predominantly limestone, of which about 50% was used for road metal and concrete aggregate, 40% for cement manufacture, and 10% for various specialty uses. Almost all of the output of sand and gravel was used as concrete aggregate. Perak, Johore, Penang, and Pahang were the major producing States.

Kaolin production during the year was almost 32,000 tons. Part of the output was consumed domestically by the ceramics, paint, rubber, plastics, and pesticide industries; the remainder was exported to Japan and Singapore. Domestic ball clay, obtained mostly from alluvial tin mining operations, was used with kaolin for manufacturing wall, floor, and mosaic tiles and sanitary and table ware. Common clay mined locally was used primarily in drainage and sewer pipes, flower pots, and similar uses.

Output of quartz sand and powder was primarily from sand deposits in Johore and from tin tailings operations. Most of the quartz was used domestically by the glass and ceramics industries, and some was exported. Barite production in 1977 was 12,000 tons, all from the Tasek Chini deposit in Pahang.

MINERAL FUELS

Natural Gas.—The total output of associated natural gas in 1977 was estimated at about 96 billion cubic feet. There is no commercial utilization of associated natural gas in Malaysia. Only about 20% was collected and used, about 15% was used as fuel in exploration and production activities, and about 5% was sold to Sarawak Electricity Supply Co. and to brick manufacturers in Miri, Sarawak. The remainder was simply flared.

As part of the National Petroleum Policy, Petronas asked the oil companies working in Malaysia to submit plans to commit the gas to economic use or to conserve it. In addition, Petronas continued negotiations with Shell Oil Co. of the United States and Mitsubishi Corp. of Japan for construction and operation of a liquefaction plant to utilize gas from the Central Luconia fields in Sarawak. Work on the $1 billion proposed plant would begin as soon as final agreement was reached among the partners. The plant, tentatively scheduled for startup in 1982, would have an annual capacity of about 6 million tons of liquefied natural gas.

Petroleum.—Malaysia's National Petroleum Policy was designed to achieve several objectives in protecting the national interest, including sufficient control to enable the country to derive maximum benefit from its oil industry, ensuring an adequate domestic supplier of petroleum and petroleum products, establishing industries related to petroleum and petrochemicals, and ensuring active participation of the national oil company, Petronas. In March, the Petroleum Development (Amendment) Act amended the Petroleum Development Act of 1974. The new legislation repealed the management share provision of the 1974 act. Additionally, the Prime Minister was empowered to exempt such activities as petroleum refining, manufacturing of petrochemical products, and marketing of petroleum or petrochemical products from the licensing requirement of the 1974 act.

Digitized by Google

The Amendment Act also made provisions for compensation to any oil company whose rights under the previous Concession License had been abrogated on enforcement of the 1974 act.

By the end of 1976, Petronas had completed ratification of production-sharing contracts with Sarawak Shell Bhd., Sabad, Sabah Shell, and Exxon. The terms and conditions of all contracts were essentially the same and are designed to ensure the development of Malaysia's petroleum resources with maximum yield to the country while assuring the participating oil companies a fair return on their investment. The duration of the contracts was for 20 years with possible extensions of 4 years for oil and 14 years for gas.

Although 19 oilfields of commercial value have been discovered in the offshore areas of Sabah, Sarawak, and Malaya, only 8 were in production in 1977. Sarawak Shell operated 6 fields offshore Sarawak (West Lutong, Baram, Baronia, Tukau, Bakau, and Fairley Baram) with a combined production rate of 116,213 barrels per day. The second largest producer, Sabah Shell, operated its only field at Samarang at 64,305 barrels per day. Exxon, which produced 4,254 barrels per day in June 1976 from its Tembugo Field, increased production sharply to 11,336 barrels per day in June 1977 after settlement was reached on its production-sharing agreement in December 1976. In addition, Exxon had promising oilfields in Pulai, Tapis, Bekok, and Seligi in the South China Sea. The Continental Oil Co. of Malaysia (Conoco) had discoveries at Sotong, Anding, and Duyong (the only natural gasfield found off Malaya, situated a few miles to the south of Exxon's exploration areas). Production from Exxon's new oilfields off the Trenggau coast was expected to come onstream in mid-1978 at an initial rate of about 5,000 barrels per day. Conoco had not yet contracted a production-sharing agreement with Petronas, owing to the need for further detailed studies.

Because Exxon's Pulai and Tapis oilfields in Malaya were expected to begin production in mid-1978 and because of the possibility of production from Sabah Shell's oilfields at Erb West in offshore Sabah, crude oil production in 1978 was projected to increase 7.7% over that of 1977 to 210,000 barrels per day.

The intake of crude oil by the three refineries in Malaysia (the Shell and Exxon refineries at Port Dickson and the Shell refinery at Lutong, Sarawak) averaged about 109,206 barrels per day. About 20% of the production of crude oil was consumed domestically for refining, and the rest was exported. The refinery at Lutong uses only local crude oil; the Port Dickson refineries were designed to refine feedstock in the ratio of 70% imported heavy crude oil to 30% locally produced crude oil. Moreover, the product mix of the output at the Port Dickson refineries meets more of Malaysia's demand, 45% of which was for middle distillates such as diesel fuels and kerosine. Additionally, Malaysia benefits from the export of local crude since this lighter grade commands a higher unit price.

Castrol (Malaysia) Sdn. Bhd. in a joint venture with the Negri Sembilan State Development Corp. completed construction of a lubricating-oil-blending plant at Port Dickson. Initial production was in March 1977 and will be tailored to the needs of the local market. Ninety-nine percent of the lubricating oils now imported by the company will be produced locally by this plant. An oil terminal at Labuan, Sabah, was opened on March 15. This project was a joint venture between Pecten Oil Co. and Sabah Shell. Petronas was also to use this facility. A petroleum supply base with facilities ranging from equipment services for exploration and production activities to food and labor activities was being established at Chukai in Trengganu. This base was to service and facilitate the operations of Exxon and other oil companies operating in the new oilfields off the eastern coast of Malaya. Petronas also began construction of airport refueling projects, whereby Petronas was to participate actively in the marketing and distribution of fuel oil to all Malaysian airports. The first project at the Penang airport was scheduled for completion by mid-1978. A similar network to service Malaysian seaports was also being considered by Petronas, which was currently studying proposals on the supply of bunker fuel at Port Kelang and Pasir Gudang (Johore).

The Mineral Industry of Malta

By Roman V. Sondermayer[1]

The mineral industry of Malta, a small three-island country situated south of Sicily, consisted of salt and limestone production during 1977. The modest demand for fuels, construction materials, fertilizers, diamond, and metals was met through imports.

PRODUCTION AND TRADE

Table 1 shows the latest trends in production of minerals in Malta.

Malta depends on imports of a variety of mineral commodities, but all in small quantities, reflecting the size of the country.

Fuels were the major import and export items, and bunkering was the principal way of exporting fuels. Trade with the United States was modest in value, as shown in table 3.

Table 1.—Malta: Production of mineral commodities

Commodity and unit of measure	1975	1976	1977[p]
Lime—thousand metric tons	34	27	32
Limestone[e 1]—thousand cubic meters	740	962	802
Salt—metric tons	279	290	797

[e]Estimate. [p]Preliminary.

Limestone and salt were the only two minerals produced in Malta. The size of the country and the lack of a large manufacturing industry limited demand for imported mineral industry products.

Limestone was produced in various locations on the islands of Malta and Gozo. The largest quarries were situated near the capital city of Valletta. Debono Enterprises Ltd., at St. Paul's Bay, was among the major quarry owners and operators.

Salt was produced in Salina Bay on the island of Malta. Lime was in short supply, and during 1977 a feasibility study was completed for a lime plant, using local limestone. No decision was made on actual construction.

Small quantities of imported steel and nonferrous metals were consumed by the manufacturing industry. Some precious metals were consumed by jewelers, and several diamond cutters operated facilities for diamond cutting.

All fuels, both liquid and gaseous hydrocarbons, were imported. Consumption of fuels for bunkering was very large compared with consumption of other mineral commodities. Petroleum refinery products were used by the transportation sector, for production of electricity, and in households. Two power stations with an aggregate capacity of 115 megawatts, fueled with fuel oil, supplied electric power to the island. Besides the electricity-generating facilities, the power station complex included four 1-million-gallon-per-day seawater distillers. The fresh water produced is pumped to the Luga and Ta' Qali water reservoirs. Powerplants and seawater distillers were operated by the Malta Electricity Board, a public corporation.

Liquefied petroleum gas (LPG) was also imported, and the Malta Gas Board operated an LPG bottling plant at B'Bugia, Malta, with storage capacity for 800 tons of LPG.

During 1977, no offshore wells were drilled; sea boundaries between Malta and other countries must be determined before any drilling can start.

The Mineral Industry of Mauritania

By Candice Stevens[1]

The mineral industry contributed approximately 45% to the 1977 gross domestic product of Mauritania, estimated at $460 million.[2] However, production of mineral commodities was at a low level owing to low metal prices and depletion of older deposits. Although approximately $500 million was to be invested in mineral development under the third 5-year plan (1976-80), many projects were suspended owing to a shortage of funds. Among the proposed projects were exploitation of low-grade iron ore deposits and construction of a steel mill. Mauritania's foreign debt tripled from 1974 to 1977, and development projects remained heavily dependent on foreign loans and grants.

In 1976, Mauritania adopted a new policy of inviting foreign investment, public or private, in mining and industrial ventures. Most foreign mining ventures in Mauritania had previously been nationalized and placed under Government supervision. A new investment code adopted in 1976 included economic incentives such as tax exemptions, guarantees against nationalization, and provisions for profit repatriation.

Mineral exploration was limited in Mauritania in 1977. Previously, surveys were being conducted by the Bureau de Recherches Géologiques et Minières (BRGM) of France and other foreign groups on deposits of lead-zinc and copper at Adrar, iron ore at Tiris and Tasiast, and copper at Affolé. Portions of the northern Dorsale Reguibat region were under examination for gold (Conchita-Florence), tin (Catherine), and manganese. Black sands along the Atlantic coast were estimated to contain 250,000 tons of ilmenite and were surveyed for rutile, zircon, and monazite content. Extensive phosphate exploration was also conducted in the Senegal River Basin area.

In 1977, the first section of a 1,100-kilometer road that will link the port of Nouakchott and the eastern city of Néma and open up the eastern part of the country was inaugurated. Mauritania had a total of 1,300 kilometers of paved roads. Electricity-generating capacity was to be developed to support various industrial and mining projects. Under the 5-year plan, generating power was to be increased from 54,000 kilowatts in 1977 to 180,000 kilowatts in 1980. The production and distribution of electricity and water in Mauritania was under the direction of the State-owned Soc. Nationale d'Eau et d'Électricité. Construction continued in 1977 on extensions to the port of Nouadhibou, which was scheduled for completion by yearend 1978.

PRODUCTION AND TRADE

Production of Mauritania's major mineral commodities declined in 1977 owing to fluctuating world prices for copper and iron ore and interruptions to operations caused by local political conflict. Iron ore production increased 1.3%, copper production decreased 4.6%, and gypsum production decreased 9.1% from the 1976 output. Mauritania also produced small amounts of by-product gold and silver, and some salt for local consumption.

Exports of iron ore, accounting for approximately 80% of Mauritania's foreign exchange earnings, fell to the lowest tonnage since 1969. In 1977, iron ore exports were approximately 8.4 million tons, earn-

Digitized by Google

ing about $130 million in export value. Exports went primarily to France (33%), the United Kingdom, Japan, Italy, and the Federal Republic of Germany. Copper exports reached their lowest level since 1971, at 12,000 tons; the main destinations were Spain and France. Almost all gypsum production was exported to Senegal. Mineral imports consisted of cement, fertilizer, and semimanufactures; Mauritania also imported approximately 860,000 barrels of refined petroleum products in 1977.

Mauritania was a member of the Communauté Economique de l'Afrique Occidentale (CEAO), a regional organization which exempted member nations (Ivory Coast, Upper Volta, Niger, Mali, and Senegal) from customs duties. Mauritania was also a signatory of the Lome Convention, which called for preferential treatment of exports from member African nations into the European Economic Community. In 1975, Mauritania, Venezuela, and Algeria were the first three countries to sign the charter of the Association of Iron Ore Exporting Countries (AIOEC).

Table 1.—Mauritania: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1975	1976	1977[p]
Copper, mine output, metal content	16,203	9,431	[e]9,000
Gold ---troy ounces	[e]42,000	22,120	[e]20,000
Gypsum	12,669	11,195	10,176
Iron ore and concentrate, gross weight---thousand tons	8,677	9,664	9,794
Rare-earth metals: Monazite concentrate, gross weight[e]	100	100	100
Salt, marine[e]	1,000	1,000	1,000
Silver ---troy ounces	[e]26,000	31,572	[e]26,000

[e]Estimate. [p]Preliminary.

[1]In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials (clays, stone, and sand and gravel) presumably are also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

COMMODITY REVIEW

METALS

Copper.—Copper production at Akjoujt decreased from 9,431 tons in 1976 to 9,000 tons in 1977, the lowest output since the mine reached a peak production of 21,277 tons in 1973. Low copper prices, technical difficulties, and departure of foreign technicians led the Mauritanian Government to consider closing down the Akjoujt operation. Copper production was under the direction of the State-owned Soc. Nationale Industrielle et Minière (SNIM).

Reserves of copper oxide ore, with estimated reserves of 2.3 million tons averaging 2.7% copper, are due to be exhausted by 1980. A feasibility study was in progress on the exploitation of copper sulfide reserves, estimated at 13.7 million tons averaging 2.3% copper. Although copper sulfide reserves were considered less difficult to process than the copper oxide ore, new equipment for extraction and concentration was necessary. The $70 million copper sulfide project at Akjoujt was expected to have an annual capacity of 120,000 tons of ore. In 1977, Hawker Siddeley Power Engineering Ltd. won a $4 million contract to increase the output of the Akjoujt power station to 23 megawatts. Commissioning of the power station was scheduled for 1980.

Installation of a copper smelter at Nouakchott by Soc. Arabe d'Industries Métallurgiques was still in the planning stage in 1977. A joint venture of Mauritania and Kuwait, the company was to make an initial investment of $100 million in the construction of the smelter, which was to have an annual capacity of 30,000 tons of copper.

Iron and Steel.—Production of iron ore at Zouérate, situated in northeastern Mauritania near the Spanish Saharan border, increased from 9.7 million tons in 1976 to 9.8 million tons in 1977. The three mines, Tazadit, Rouessa, and F'Derick, were operating below capacity owing to damages suffered during ongoing local political conflict and the departure of foreign technicians. Iron ore production was under the direction

Digitized by Google

of Complexe Minièr du Nord (COMINOR), a division of SNIM. Combined reserves of the three mines, where production was to be phased out by 1985, were 100 million tons of ore averaging 65% iron.

The decline in activity at the older mines was to be compensated for by exploitation of lower grade ore reserves in outlying bodies known as the Guelb deposits. Situated within a radius of 50 kilometers of Zouérate, these deposits have total reserves estimated at 1.5 billion tons of magnetite ore averaging 38% iron. In 1977, the evaluation of two magnetite deposits, at El Rhein and Oum Arwagen, was in progress. The development project would include a 37-kilometer spur line from the existing railroad to El Rhein and an additional 26-kilometer extension to Oum Arwagen, facilities for open pit mining of the deposits at the two locations, and concentration through magnetic separation at El Rhein coupled with wet-gravity separation at Nouadhibou. Exploitation was to begin in the mid-1980's with an annual production capacity of 6 million tons. Mauritania was in the process of securing financing for the $500 million project, including a $50 million loan from the International Bank for Reconstruction and Development (IBRD). Other potential sources of capital included Arab Mining Co. ($28 million), Abu Dhabi ($20 million), Saudi Arabia ($60 million), Kuwait ($40 million), the Arab Fund for Loans to African Countries ($35 million), the African Development Bank ($12 million), the European Investment Bank ($25 million), and Caisse Centrale de Cooperation Economique of France ($25 million).

In 1977, Kobe Steel Ltd. (Japan) was contracted by Soc. Arabe d'Industries Métallurgiques to construct an iron ore-pelletizing plant at Nouadhibou. The $130 million plant, to be owned jointly by Mauritania and Kuwait, would have an annual capacity of 2 million tons. Completion was scheduled for 1981.

H. K. Ferguson (United States) was conducting a feasibility study for the construction of a ministeelworks in Nouadhibou. Initial capacity of the steel mill, which would produce rods and bars for construction purposes, was to be 12,000 tons per year. The $10 million plant was to be commissioned in 1980. Energy requirements were to be provided by a new powerplant under construction at Nouadhibou.

Uranium.—Promising uranium mineralization was situated in the northern Tasiast and Dorsale Reguibat regions, but reserves and grade have yet to be evaluated. Prospecting has been carried out since 1975 by Cie. Française des Pétroles (CFP) in conjunction with Péchiney Ugine Kuhlmann (France), Commissariat à l'Énergie Atomique (France), and Tokyo Uranium Development Co. The exploration agreement provided for the Mauritanian Government to acquire a 51% share of any joint venture formed to exploit uranium findings in the 165,000-square-kilometer concession area.

NONMETALS

Gypsum.—Production of gypsum, completely under the control of SNIM, decreased from 11,195 tons in 1976 to 10,176 tons in 1977. The major part of output was exported to Senegal for use in the West African Cement Co. plant at Rufisque. Mining at the gypsum quarry at Sebkha de N'Drahamcha, 65 kilometers north of Nouakchott, began in October 1973. Reserves were estimated at 10 million tons in 1977. SNIM planned the construction of a plasterworks with an annual capacity of 11,000 tons near the gypsum deposits; the output would be used locally.

MINERAL FUELS

Petroleum.—Exploration for petroleum resources in Mauritania was limited in 1977. Most of the foreign petroleum companies, including Texaco Mauritania Inc., Shell Mauritania Co., Esso Co., and Western Enterprises, Inc., relinquished their oil-prospecting concessions in 1975-76 owing to disappointing results. The only active exploration was by the Seagap Group, a consortium including Hispanoil (Spain), Getty Oil Co. (United States), Phillips Petroleum Co. (United States), and Agip S.p.A. (Italy). Hispanoil was the operator for the Group, in which each company had a 25% holding. Approximately 3,000 line-miles of seismic work was completed in Seagap's 24,000-square-kilometer concession area, which included both onshore and offshore areas south of Nouadhibou. No drilling activity was reported in 1977.

L'Unité de Commercialisation des Produits Pétroliers (UCPP), a division of SNIM, was responsible for the sale and distribution of all petroleum products in Mauritania. Under the supervision of UCPP, construction of a petroleum refinery at Nouadhibou neared completion. The Austrian firm Vöest-Alpine AG was contracted to build

Digitized by Google

the refinery at an estimated cost of $83 million. Pipelines from the refinery to the export dock were completed in 1977, and startup was scheduled for mid-1978. The refinery was to have an annual capacity of about 7 million barrels of crude oil, supplied primarily by Nigeria. Annual production was to consist of approximately 2 million barrels of gasoline, 1.4 million barrels of diesel fuel, 2.5 million barrels of fuel oil, 580,000 barrels of jet fuel, and 18,000 barrels of liquefied petroleum gas. Approximately one-third of the output was to be consumed domestically, and the balance was destined for European markets.

The Mineral Industry of Mexico

By Doris M. Hyde[1]

Mexico's 1977 gross domestic product (GDP) at current prices was $74.2 billion,[2] which represented a 3.2% increase over 1976 if measured in real terms. The mining sector contributed 1.6% of the GDP in 1977, and the petroleum sector accounted for 3.9%. Inflation continued to grow at the rate of 20.7% per year.

Substantial new discoveries of oil and gas were made during 1977, and continued exploration is expected to reveal additional reserves. The petroleum industry has responded well to increased exploration and development expenditures and easily leads all other sectors of the economy in growth and potential. Petroleum revenues have been targeted to play a major role in financing Mexico's future economic growth. The mining sector proved disappointing from a growth standpoint in 1977, mostly due to weak demand and technical and labor difficulties. Improved market conditions and committed expansions in mining and mineral-related industries are expected to substantially increase the economic impact of minerals on the nation.

In cooperation with the Government's policy to expand the economy, 27 member companies of the Mexican Mining Chamber of Commerce, Camara Minera de México (CAMIMEX), had signed in December 1976 an alliance for production agreement with the Government to invest $2.5 billion during the following 6 years. The major portion of this investment, $1.1 billion, was allocated for increasing the capacity and efficiency of existing plants. The remainder was apportioned to the areas of exploration ($105 million), new projects ($650 million), industrialization of metals ($13 million), and other projects ($300 million). As conceived, the plan was expected to double production and increase the value of exports to $4.8 billion by 1982. The creation of 80,000 new jobs was projected but skepticism has been expressed that new employment opportunities would be that high since mining is a capital intensive industry. In 1977, the mineral industries directly employed 150,000 workers. The largest investment commitments were made by Mexicana de Cobre ($450 million), Industrias Peñoles ($375 million), Fundidora Monterrey ($360 million), Cía. Minera de Cananea ($290 million), and Industrial Minera México ($290 million). Investments of lesser magnitude but still of major significance will be made by Cía. Minera Autlán, Las Encinas S.A., Grupo Frisco, Cía. Fresnillo, and the Peña Colorada consortium.

Government Policies and Programs.—The private mining sector in Mexico was granted an extension of time in which to comply with the new mining law of 1975. The new deadline for compliance was established as December 31, 1978.

A new mining tax law was passed in December 1977 with an effective date of January 1, 1978. This new law, the first mining taxation change in 22 years, was favorably received by the mining sector and was generally expected to stimulate development.

The old tax law established five means of taxation: A production tax, a concession tax, a general export tax, an additional 10% export tax on 12 minerals and metals, and a 15% tax on the first sale of gold and silver. The new law reduces these five to two, a tax on production and a tax on concessions. The old production tax included 48 different rates ranging from 1.34% for arsenic trioxide to 20.6% for gold. The new simplified production tax provided only three rates

Digitized by Google

based on official values: 9% for gold, silver, and sulfur; 4% for coal, iron, and manganese; and 7% for all other minerals. A greater flexibility in the determination of any official value of minerals was agreed to by the Government. An automatic subsidy of 2% is applied but must be countered by the expenditure of an equivalent sum for exploration and development activities. Accelerated depreciation on mining equipment can go as high as 33% if it is fabricated in Mexico and if the allowance is reinvested within 5 years.

Recent exploration and development activities have encouraged speculation as to Mexico's future petroleum potential. There has been some internal discussion as to whether or not the production rate should be substantially increased to provide an immediate solution to pressing economic problems. The Government's policy has been to use a conservative approach in expanding production to allow for a steady economic growth with only moderate inflation. Gradual production increases were announced that will permit the export of 1 million barrels of oil per day by 1980. Petróleos Mexicanos (PEMEX) continued to be cautious in projecting immense reserve estimates and counseled the Government to maintain a prudent attitude toward exploitation that would not prejudice Mexico's future domestic needs.

The proposed sale of 2 billion cubic feet of natural gas per day to the United States, through a pipeline to be laid from the Reforma region to Monterrey with a branch for delivery to the U.S. border, was well publicized and would result in a substantial boost to the Mexican economy. The sale price of $2.60 to perhaps as much as $2.76 per thousand cubic feet was keyed to the price of No. 2 fuel oil in New York harbor. Gas imported from Canadian sources during 1977 was sold at about $2.16 per thousand cubic feet and the requested increased price for new U.S. gas, as presented in proposed U.S. energy legislation, was $1.75 per thousand cubic feet. The potential wide-ranging impact on various aspects of the U.S. energy sector led to considerable controversy and delayed U.S. Government approval of the Mexican gas transaction. Mexico did not renew its letter of intent with the U.S. pipeline companies.

PRODUCTION

The mining industry represents Mexico's fourth largest foreign exchange earner. Silver, zinc, steel, copper, sulfur, lead, coke, fluorite, gold, and manganese, in that order, were the major earners in the minerals sector of the economy. Iron ore production declined about 2% from the 1976 level due to a prolonged strike but was sufficient to accommodate Mexico's steel plants. Lead, sulfur, and fluorite production also fell below 1976 levels as reflections of depressed market conditions. The other major minerals registered production increases.

On the basis of estimates covering 18 metallic and 26 nonmetallic minerals, the total production value of Mexico's mining industry increased 9%, from $1.1 billion (revised) in 1976 to $1.2 billion in 1977. When stated in Mexican currency, the production value increased almost 60% over that of 1976. The large percentage discrepancy was accounted for by the devaluation of the Mexican peso during 1976.

Crude oil and condensate production averaged 981,071 barrels per day for 1977, a 22.5% increase over 1976. Natural gas liquids production was 104,770 barrels per day, a 12% increase over that of 1976. Lack of transportation and processing facilities resulted in a 3% decline in gross natural gas production from the 2,114 million cubic feet per day produced in 1976. In 1976, 24% of total gas production was flared, but in 1977 this volume was reduced to 13%. As more new cryogenic and absorption plants come into operation, PEMEX expects flaring to decrease, predicting its share at only 2.5% in 1978.

In November 1976, there were 30% and 20% increases in the domestic price of refined and petrochemical products, respectively. These increases were responsible for the apparent 1977 increase of 37.5% over the 1976 value of domestic sales by PEMEX. Domestic sales volumes of petroleum products only increased about 3% over 1976 despite the relatively low composite domestic price per barrel of about $6.50.

In 1977, the petrochemical industry produced 4.2 million tons of petrochemicals from 63 operating plants producing 38 basic derivatives. This represents a 6.4% increase over 1976 production and, if production schedules are met, 1978 should show a 34% increase over 1977. Production in 1980 was projected at 18 million tons of petrochemi-

Digitized by Google

cals, including 44 basic derivatives. This impressive production increase will be accomplished through the completion of 37 new plants currently under construction and an additional 39 plants which are in various planning stages.

TRADE

The value of total Mexican exports in 1977 was $4.1 billion, an increase of 24% over the revised 1976 value of $3.3 billion. Nonfuel mineral-related exports were $445 million, or 11% of the total 1977 exports. Silver, zinc, lead, sulfur, and fluorspar minerals and products were the principal contributors. Total petroleum products exports jumped to an estimated $1.02 billion in 1977 (a 134% gain over the 1976 value of $436 million) representing 25% of total exports. Crude oil accounted for 97% of the petroleum-related exports.

Although sales to the United States accounted for the major portion of petroleum exports, for the first time Mexico exported petroleum to Europe. PEMEX planned to continue market diversification, eventually expanding sales to include Europe, Japan, and Latin America.

The total value of 1977 Mexican imports was $5.49 billion, a decline of 9% from the 1976 level. Nonpetroleum-related mineral imports were valued at $285 million, compared with $226 million in 1976. Petroleum product imports for 1977 amounted to an estimated $208 million, a decrease of 9.5% from the 1976 estimate of $230 million.

Available data on mineral exports and imports are shown in tables 2-3.

Table 2.—Mexico: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976[1]	Principal destinations, 1976
METALS —Continued			
Tin:			
Ore and concentrate	5,550	--	
Metal including alloys, all forms	(2)	--	
Titanium oxide	71	178	Ecuador 61; Peru 51; Chile 36.
Tungsten ore and concentrate, gross weight	3,053	NA	NA.
Zinc: Ore and concentrate, gross weight	103,257	153,476	Belgium-Luxembourg 83,133; Netherlands 21,456; United States 20,951.
Oxide white	6,908	9,949	United States 9,681; Canada 124.
Sulfate	3,060	5,359	United States 4,920; Canada 429.
Metal including alloys:			
Scrap	4,813	3	All to El Salvador.
Powder	8,645	8,302	All to United States.
Unwrought	86,471	123,260	United States 53,213; Brazil 32,424; Netherlands 10,204.
Other nonferrous base metals:			
Ores, concentrates, and metallurgical residues, except scrap	73	487	All to United States.
Metal, all forms	310	998	Brazil 807; Argentina 64; Netherlands 62.
NONMETALS			
Abrasives, natural, n.e.s.:			
Emery	1	1	Mainly to Guatemala and Dominican Republic.
Pumice	55	169	United States 168.
Asbestos	2	--	
Barite and witherite	113,675	106,728	Mainly to United States.
Clays and clay products:			
Crude clays, n.e.s.:			
Bentonite	56	6	El Salvador 5; United States 1.
Fuller's earth and other earths	11,011	12,696	Brazil 5,419; Colombia 1,188; Peru 1,474.
Kaolin (china clay)	31	10	All to Colombia.
Other	335	314	Guatemala 140; Peru 54; Colombia 46.
Diamond, industrial carats	140,000	--	
Diatomite and other infusorial earth	3,364	3,606	Argentina 2,108; Brazil 525; Peru 301.
Feldspar	40	54	Venezuela 50; United States 4.
Fertilizer materials, crude phosphatic	257	747	All to United States.
Fluorspar:			
Acid grade	360,765	262,977	United States 240,708; Canada 22,242.
Metallurgical grade	478,204	400,189	United States 346,644; Canada 46,287.
Graphite, natural	46,657	45,707	United States 45,677.
Gypsum:			
Crude thousand tons	585	1,087	United States 1,051.
Calcined do	16	33	Belgium-Luxembourg 26; United States 7.
Magnesite	--	15	Mainly to Guatemala.
Mica	51	45	All to United States.
Perlite	2,282	3,869	Brazil 1,689; Cuba 618; Colombia 443.
Precious and semiprecious stones, except diamond kilograms	4,728	5,026	United States 2,394; Japan 2,367.
Salt thousand tons	3,653	3,282	Japan 2,325; United States 701.
Sodium and potassium compounds:			
Sodium hydroxide	4,466	208	Argentina 197; Guatemala 11.
Sodium sulfate	117,273	119,308	Brazil 90,058; Venezuela 19,412.
Stone, sand and gravel:			
Dimension stone	--	1,694	Switzerland 819; United States 465; Italy 221.
Dolomite	--	370	Guatemala 270; El Salvador 100.
Gravel and crushed rock	--	4,666	All to United States.
Limestone, (except dimension)	2,121	NA	NA.
Quartz and quarzite	3,339	864	Do.
Sand:			
Construction	2,546	997	United States 801; Guatemala 76; El Salvador 74.
Glass	23,979	NA	NA.
Strontium minerals	15,028	NA	NA.
Sulfur, elemental, all forms thousand tons	1,368	1,020	United States 732; United Kingdom 134.
Talc	--	5	All to Honduras.
Vermiculite	551	311	All to United States.
Wollastonite	51	806	Mainly to United States.
Other nonmetals, n.e.s.:			
Crude	--	31,542	All to United States.
Oxides and hydroxides	--	2	Do.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	6	10	All to Spain.
Carbon black	2,213	964	United States 808; Venezuela 120.
Coal and coke	7	5	All to Venezuela.
Peat, including peat briquets and litter	17	--	
Petroleum:[3]			
Crude thousand 42-gallon barrels	38,311	44,145	NA.

COMMODITY REVIEW

METALS

Aluminum.—Construction was delayed on the Jalumex aluminum smelter, a joint Mexican-Jamaican endeavor to be located near Vera Cruz. In November 1977, the two countries reached an agreement on the pricing formula for the alumina that is to be supplied by the planned Javemex plant in Jamaica. Financing arrangements appeared to be a possible deterrent to finalization of the project.

Aluminio, S.A. de C.V. remained Mexico's only primary aluminum producer. Plant expansion work was completed in 1977, doubling capacity to 90,000 tons per year.

Copper.—Certainly the most publicized mineral undertaking in Mexico has been the La Caridad open pit porphyry copper mine, smelter, and refinery complex. With a capacity of 100,000 tons per year of metal, La Caridad will be one of the largest copper mines in the world and will more than double Mexico's copper production capacity. Controlled by Mexicana de Cobre, S.A., owned 44% by the Government, the ultimate cost of the project, including the smelter and refinery, has been estimated at more than $900 million. By mid-1977 there were 6,000 people employed on the project, 48 million tons of waste had been stripped, and 5 million tons of leach-grade ore stockpiled. The mine development has fallen behind schedule with startup now not expected until late 1978 or early 1979. The smelter site has been changed from Empalme on the Gulf of California to a location nearer the mine and close to the Nacozari to Bisbee railroad. The deposit is located in the State of Sonora about 20 kilometers southeast of Nacozari de García. It has been estimated to contain 660 million tons of proven ore reserves assaying 0.67% copper and 0.02% molybdenum. The molybdenum sulfide is primarily concentrated in the eastern half of the deposit where it can average as high as 0.37% molybdenum while the western half drops to about 0.01%. A 100-ton-per-day pilot plant operation was maintained throughout 1977 to confirm the metallurgy, train personnel, and determine a molybdenum flowsheet. Favorable market outlook projections for molybdenum may hasten recovery plans which are not presently intended to begin for several years.

Despite the general enthusiasm for Mexico's copper prospects, the depressed world copper market and some difficulty in securing sufficient Mexican participation to meet the 51% local equity requirement, prompted Lytton Minerals Ltd. of Canada to withdraw from its 48% participation in Cía. Minera Cuprifera La Verde, S.A.'s La Verde mine project in the State of Michoacán. The property has reverted to the Government.

The Government, through the Comisión de Fomento Minero, acquired operating majority in the Cía. Minera de Cananea's open pit copper mine in Sonora. Federal and private Mexican interests now hold 66% of the shares while the Anaconda Company, now a subsidiary of Atlantic Richfield Co., retained 34%. Expansion of mine and smelter capacity to 70,000 tons per year of copper was completed in early 1977. A further increase to 100,000 tons per year was under study.

Iron and Steel.—Exploration activities pursued by the major mining companies have increased total iron ore reserve estimates to 200 million tons grading 60% iron in northern Mexico and 311 million tons grading 55% iron in the southern part of Mexico.

Strikes, shortages of raw materials, and operational difficulties reduced crude steel production to about 60% of the 9 million tons per year total capacity. Even this unsatisfactory production level represented a 5.7% improvement over 1976 level. An encouraging development was the changing proportion in the amount of crude steel

Digitized by Google

produced by different processes. The basic oxygen furnace process (BOP) accounted for 27% of 1977 production. Production from the electric arc method (44%) also increased while that from the less efficient open-hearth method (29%) declined. Ferroalloys output was the most active sector among primary products with a 63% increase over 1976 production. Mexico's five integrated steelplants produced 85% of the total finished steel production. The following shows a comparison of primary product and crude steel production from 1975 to 1977, in thousand tons:

	1975	1976	1977
Primary products:			
Ferroalloys	98	93	152
Pig iron	2,048	2,413	3,009
Sponge iron	914	1,115	1,320
Crude steel:			
Open hearth	2,185	2,154	1,628
Electric furnace	2,400	2,441	2,470
BOP	687	703	1,504
Total[1]	5,272	5,298	5,601

[1]Data may not add to totals shown because of independent rounding.

In 1977, the Government acquired a 44% controlling interest in Fundidora de Monterrey, S.A., and thereby established majority ownership in three of Mexico's five integrated steel complexes. Eventually all three plants, Fundidora, Altos Hornos de México, S.A. (AHMSA), and Siderúrgica Lázaro Cárdenas Las Truchas, S.A. (SICARTSA), will probably be merged into a single holding company, Sidermex.

For the most part the large Mexican steel companies have not fared well financially. Only HYSLA (formerly Hojalata y Lámina, S.A.) escaped the various difficulties suffered by the other four major companies.

Higher infrastructure costs resulting from the devaluation of the Mexican peso were partially responsible for expansion postponements at the SICARTSA complex, which operated at 20% of capacity in 1977. Another serious consideration was the substantial downward revision of reserves at the nearby Las Truchas iron ore deposit from 130 million to 70 million tons and the now questionable dependability of a continued supply for sufficient years to justify the cost factors.

The following tabulation gives 1977 production, current capacity, and the projected capacity of Mexico's major steel companies, in thousand tons:

Company	1977		1981 capacity
	Production	Capacity	
AHMSA (Altos Hornos de México, S.A.)	2,197	3,200	4,200
HYSLA (Hojalata y Lámina, S.A.)	1,271	1,545	2,300
Fundidora de Monterry, S.A	671	1,500	1,870
TAMSA (Tubos de Acero de México, S.A.)	367	425	745
SICARTSA (Siderúrgica Lázaro Cárdenas Las Truchas, S.A.)	263	1,300	1,450
Nonintegrated plants (26 plants)	832	1,060	1,150
Total	5,601	9,030	11,715

Lead and Zinc.—Production of lead and zinc ore continued to outstrip refining capacity. The three operating refineries have a combined zinc metal capacity of 171,000 tons per year. Low prices and reduced world demand could slow down the electrolytic zinc smelter construction by Industria Minera Mexico, S.A. (IMM), at San Luis Potosí. Operational problems were corrected at the Industria Peñoles, S.A. smelter at Torreón and output approached 90% of installed capacity at the end of the year. By 1981 Mexico's total zinc metal refining capacity should reach 322,000 tons per year, bringing mine output and refinery capacity into balance.

At the end of 1977 persistent poor world market conditions prompted U.S. zinc producers to petition the U.S. International Trade Commission to limit total metallic zinc imports subject to the present 0.7 cent per pound import tax to 350,000 short tons. It was further petitioned that amounts over 350,000 short tons be taxed at 7 cents per pound. Since the United States is the major single market for Mexican zinc exports, the Mexican Government was expected to submit counter petitions to the ITC emphasiz-

Digitized by Google

ing the grave consequences of these proposed import restrictions and their punitive effect on Mexico's traditional market sales to the United States. Fortunately, those minerals produced in association with zinc, particularly silver, experienced favorable market conditions and rising prices, countering the adverse zinc market and providing a stimulus to productivity.

During the last 4 years Industria Minera México, S.A. has substantially increased production at its three major mines. Santa Barbara in Chihuahua, one of the largest underground mines in Mexico produces gold, copper, lead, and zinc. The mine has a capacity of 2,400 tons of ore per day. At the San Martín mine in the State of Zacatecas, silver, copper, and zinc ore was produced at the rate of 1,350 tons per day and by 1980 output should double. At Taxco, in Guerrero, mine capacity has increased to 300,000 tons per year. These three mines along with additional production from the Plomosas and Santa Eulalia mines accounted for the major portion of zinc production in Mexico. Peñoles installed a flotation plant at the Encantada mine and when fully operational the mill will have a full capacity of 400,000 tons per year of lead-silver ore. Lacana Mining Corp. is a partner in the project.

Manganese.—Cía. Minera Autlán, S.A., increased output from its underground and open pit mines in the State of Hidalgo northeast of Mexico City. The company contributed at least 90% of total Mexican manganese production, having produced 437,084 tons of ore in 1977, a 17% increase over 1976. About 46% of this production was sold for domestic consumption. The company's output is primarily in the form of a calcined nodulized ore with the manganese and iron contents in their lowest valence form of manganese oxide and iron oxide. Minera Autlán is a vertically integrated company and, as such, is also a major producer of ferroalloys. In 1977, the company provided about 65% of the country's ferromanganese requirements. Mexico's proved reserves of manganese were estimated at 62 million tons of metal content.

Silver.—Mexico maintained a comfortable lead as the principal world producer of silver with 1977 production exceeding 47 million ounces. Industrias Peñoles, S.A., continued to account for the major portion of the production having refined about 31.3 million ounces in 1977.

Rosario Resources Corp., which already owned 40% of Cía. Fresnillo, S.A., announced plans to merge Fresnillo into Rosario by offering Rosario stock for Fresnillo common stock. Fresnillo's largest operation was at Naica in the State of Chihuahua where mill capacity should reach 2,400 tons of ore per day in 1978. The Naica mine has replaced the older Fresnillo mine in the State of Zacatecas as the company's largest and most profitable operation. It was reported that new ore bodies have been found at the old Fresnillo mines, some of which date back to colonial times. Veins from 3 to 4 meters in width and grading from 30 to 90 ounces of silver per ton were reported and, subject to further verification, would revitalize the area's mining activity.

Cía. Minera Las Torres, S.A., owned jointly by Peñoles (33%), Fresnillo (37%), and Lacana Mining Corp. (30%), operated the four underground silver-gold mines at Guanajuato. The mines, Cedros, Peregrina, Cebada, and Bolanitos, have approached capacity operation and have an estimated 3 million tons of reserves grading an average 10.5 ounces of silver and 0.06 ounce of gold per ton. Two of these mines have an expected life of about 6 more years. Las Torres has been actively exploring the Guanajuato area for additional deposits.

The flotation plant at Peñoles and Lacana's two Encantada mines in Coahuila was completed in mid-1977 and by October was in full production, at which time the old magnetic separation unit was shut down. A total of 248,000 tons of ore was treated at grades of 12.9% lead and 10.4 ounces of silver per ton.

The Comisión de Fomento Minero, the State mining holding company, joined with Placer Development Ltd. of Canada to develop by open pit the low-grade silver, lead, and zinc deposits at Real de Ángeles in Zacatecas. Proven ore reserves were estimated at 39 million tons grading 2.51 troy ounces of silver, 1.1% lead, and 1.05% zinc per ton.

Minera Frisco, S.A. de C.V. initiated production at the long idle Lampazos mine in the State of Sonora. The company found large tonnages of silver ore in structures parallel to those previously worked. Ore production in 1977 was about 150,000 tons, with increases planned to double this output.

NONMETALS

Cement.—The export market rather than domestic consumption continued to encourage expansion activities in the cement in-

Digitized by Google

dustry. During 1977 the Government was slow in authorizing new construction and the private sector exhibited a reluctance to invest in building, particularly housing. Nevertheless, the major companies planned to increase their annual production by expanding various plant capacities. The Government predicted that total annual cement production will reach 20 million tons by 1982.

Fluorspar.—The continued depression in the world steel industry, discontinued use of fluorine as an aerosol propellant, increased foreign competition for available markets and comparatively high sale prices for Mexican fluorspar products all combined to adversely affect that country's fluorspar industry.

Exports to the United States fell as consumers there took advantage of cheaper fluorspar available elsewhere. Many small Mexican producers were obliged to cease production and larger producers operated well below capacity. Producer stockpiles were estimated to be equivalent to about 5 month's production. The Mexican Fluorite Institute was influential in maintaining price levels, preventing what could have become a price-cutting war as producers vied for sales advantage. By yearend it became problematic that the institute would advocate some price reductions in view of the world market and in response to local producer pressure as they actively seek to compete for overseas markets.

Mexico's increased hydrofluoric acid production and internal sales have somewhat compensated for the reduced acidspar export market. Total fluorspar reserves were estimated at over 37 million tons (on a 35% calcium fluoride basis) and equalled almost 20% of total known world reserves.

Graphite.—Mexico led the market economy countries in the production of graphite in 1977. Production in 1977 amounted to 58,432 tons, a 3% decline from the 60,337 tons produced in 1976. About 78% of the total graphite production was exported almost exclusively to the United States. Mexico provided 72% of total U.S. graphite imports.

Mexican graphite deposits occur principally in the State of Sonora near La Colorada and Guaymas. The reserves are large and of the amorphous type containing 80% to 93% carbon. The principal producers in Sonora are Cía.Minera Moraguirre, S.A. de C.V., with a production capacity of 30 tons per day; Grafitos Industrializados, S. A. de C.V., capacity 18 tons per day; and Grafito Superior, S.A., capacity 10 tons per day. Some graphite in association with other minerals is produced in the State of Puebla by Minerales La Cruz del Sur, S.A.

Phosphate Rock.—Roca Fosforica Mexicana S.A. (ROFOMEX) installed a small 25-ton-per-day semipilot plant at the site of the large phosphate deposit in southern Baja California. Experimental mining to determine the most effective methods of ore extraction was underway. Initial development will be in the San Juan de la Costa region where reserves were estimated at 160 million tons grading about 20% P_2O_5. The reserves extend inland to the Sierras. Industrial production is scheduled for 1979, and the eventual annual production of 1.6 million tons of rock will yield about 700,000 tons of 30% to 32% P_2O_5 concentrate. Production is primarily destined for domestic fertilizer manufacture with export market considerations of secondary importance. Exploration in the San Hilario area proved reserves totaling 630 million tons but the nature of the phosphate rock prohibits low cost beneficiation and development there has been suspended.

Sulfur.—Sulfur production decreased to about 1.9 million tons during 1977. Domestic consumption was down but exports at 1 million tons were at about the same level as in 1976.

MINERAL FUELS

Coal.—Industrial Minera Mexico opened a new coal mine in the State of Coahuila in northern Mexico. The company anticipated that another mine would start operations in 1978. All of the 6.6 million tons of coal production came from the State of Coahulia and represented an increase of about 1 million tons over 1976 production. The Camara Minera de Mexico estimated proven, in place coal reserves at 1.1 billion tons, of which approximately 770 million tons was claimed to be of coking quality. These reserves should satisfy the needs of Mexico's domestic steel industry until the end of this century.

Petroleum.—A tone of optimism and confidence in the future pervaded reports describing activities of the petroleum sector during 1977. This optimism is justly based on the continued success of PEMEX's exploration and development program in extending known and discovering new petroleum and natural gas fields. Although petroleum accounted for only 3.9% of the GDP in 1977, it certainly represented the major

Digitized by Google

growth industry, with production of crude oil, condensate, and natural gas liquids 21.4% above that for 1976.

Reserves estimates were again officially increased. Proven reserves, including oil, gas liquids, and natural gas equivalents, were placed at 16 billion barrels; probable reserves at 31 billion barrels; and possible reserves (including proven and probable) at 120 billion barrels.

Proven hydrocarbon reserves for 1976-77 by producing zone, in thousands of barrels and millions of cubic feet, are shown in the following tabulation:

Zone	Dry natural gas (million cubic feet)	Petroleum (thousand 42-gallon barrels)				
		Crude	Condensate	Dry natural gas liquids equivalent	Total 1977[1]	Total 1976
Northern	11,260,226	543,221	277,584	2,252,047	3,072,848	2,352,579
Angostura	814,248	100,760	45,265	162,848	308,870	254,890

Source: Petróleos Mexicanos, Memoria de Labores, 1977. Pp. 77-78.

Exploration activities in the Reforma region continued to reveal additional data on field stratigraphic and structural relationships and established production boundaries were extended. The southern production boundary was placed 20 miles south of the Sabancuy field and the western boundary was set at Paradon, 20 miles west of the former limit at the Grijalva River. Exploration work in the Campeche Bay revealed the possibility that this area may represent extensions of the onshore Reforma fields, and should they prove as prolific as the onshore portion of the region appears to be, production and reserves would be significantly increased.

Not to be overshadowed by activity in the Reforma area was the discovery of commercial gas fields in the Sabinas Basin in the States of Coahuila and Nuevo León. Prior to this find, commercial quantities of gas were only available from the gulf coast. Four fields, the Lampazos, Monclova, Travertino, and Bueno Suerte, were under production and another, the Uluna, was being tested.

Along the central part of the gulf coastal area, explorations around Pozo Rica, Cerro Azul, and Cotaxtla have extended the productive areas of these regions.

To the west, in Baja California, exploration continued in the Vizcaino desert. Some gas was reported but no official acknowledgement was made of a commercial discovery. One well drilled offshore was reported as showing traces of oil.

For the first time in over a decade Mexico resorted to using foreign drilling rigs and crews. Six drillships, three operated by Pemex and one each by Protexa, Interocean Drilling, and Sedco, Inc., operated in the Campeche Bay. Another drillship, operated by J. L. Offshore Drilling, worked offshore Baja California. Some onshore drilling was done by Mexican companies operating under contract to PEMEX. Only offshore drilling was contracted to foreign companies and this was evidently in response to Mexico's intense exploration program and a shortage of sufficient equipment and skilled workers to accommodate scheduled work. Efficiency also dictated the 1977 contracting of foreign expertise to manage the development of the Campeche oilfields. This shortage of rigs may thwart Mexico's intense drilling program. In 1977 only 307 wells were drilled, compared with 336 during 1976. Additional Mexican companies were contracted to drill onshore in 1978, and PEMEX expected to have about 202 rigs working, including 170 of their own.

A remarkable 38% success rate resulted from drilling 79 exploration wells in 1977. The exploration work identified 26 new fields when 17 wells found oil and 9 encountered natural gas. Four wells resulted in extensions of existing fields. Of the 79 exploratory wells, 72 were located onshore, 5 offshore, and 2 in inland waters; 62 represented wildcat drilling, 11 attempted extensions, and 6 were designated as strati-

Digitized by Google

graphic tests. The 79 exploration wells resulted in an average of 10,609 feet drilled per well.

Developmental drilling activities found 125 oil wells and 51 gas wells; an impressive 77% success ratio as 176 out of 228 attempts were productive. Development was undertaken in 59 fields (1 offshore). The Reforma region received the most attention with 26 fields under development. In the Reynosa area near Monterrey 16 fields were drilled, while 12 fields in the Ebano and Cerro Azul area were drilled, and 5 field expansions were attempted in the Poza Rica and Papaloapan areas. Of the 228 attempts, 214 were conducted onshore, 4 offshore, and 10 in inland waters. The 228 development wells averaged 9,506 feet per well.

Crude oil, condensate, and natural gas liquid production averaged 1.1 million barrels per day during 1977, a 22% increase over 1976. The southern zone provided almost 80% of this production while the Poza Rica and northern Mexico areas accounted for 13% and 7%, respectively. Natural gas production decreased from 1976 because wells were shut-in while awaiting the completion of transportation and sweetening facilities. Associated and dissolved gas accounted for 58% of total gas production. Mexico's southern production zone provided the major portion of gas production 69%, the Northern zone 23%, and the Poza Rica zone almost 8%.

Total petroleum and natural gas production during 1977, by region, is shown in the following tabulation, in thousands of barrels and in millions of cubic feet:

Region	Natural gas (million cubic feet)	Petroleum (thousand 42-gallon barrels)		
		Crude	Condensate	Natural gas liquids
Northern Zone:

Source: Petróleos Mexicanos, Memoria de Labores, 1977. Pp. 74-76.

The five major and two minor refineries operated by PEMEX refined an average of 835,550 barrels of products per day, an increase of almost 13% over 1976. General refinery expansion programs and the construction of at least five new refineries were underway, two of which were scheduled to come onstream in 1978 and one in 1979.

Several pipeline projects were completed during 1977. The more important of these were the system linking refinery and petrochemical complexes at Minatitlan-Cosoleacaque with the new port facility at Pajaritos and the completion of two 18-kilometer lengths of 18-inch pipe between Poza Rica and Mexico City.

Certainly the largest and most publicized pipeline project was the approximately 1,344 kilometers (835 miles) of line under construction between the Reforma fields in the Chiapas region and the Reynosa-Monterrey area. The line will consist of 48-inch pipe from Chiapas to San Fernando and then of 42-inch pipe to Monterrey

Digitized by Google

where it is anticipated 800 million cubic feet of gas per day will be delivered under natural pressure. Original plans included the construction of a 42-inch branch line from San Fernando to McAllen, Tex., to fullfill a proposed contract with six U.S. pipeline companies who had negotiated to purchase 2 billion cubic feet of natural gas per day. This phase of construction has been delayed pending U.S. Government approval of the proposed contract. The cost of the gas aroused considerable controversy and the year ended without an acceptable agreement being reached.

The Mineral Industry of Morocco

By Janice L. W. Jolly[1]

The value of mineral production, excluding cement, natural gas, and petroleum products, contributed 7.2% to the gross national product (GNP) in 1977. Valued at $9.5 billion[2] at current prices, the GNP showed a real growth of 0.4% over that of 1976. At yearend, however, the Government was to present its 1978 budget as an "austerity" budget, a result of unrealistic expectations for high levels of phosphate earnings, which for the second straight year did not materialize. Contributing to the drop in mineral revenues was a further decline in demand in the vital European market for Morocco's exports of phosphate, iron ore, copper, and zinc. Partly as a result of these factors, Morocco's traditional trade deficit increased from $1.34 billion in 1976 to a record high of $1.78 billion in 1977.[3] The planned 1978 budget reflected lower planned investment levels and a conscious effort by the Government to come to terms with the country's current economic difficulties. An effort was to be made to reduce the trade deficit as well as to increase fiscal revenues through new taxes.

The Moroccan Investment Code continued to offer inducements to firms willing to accord local partners at least half ownership plus board chairmanship. In such priority sectors as mining and export industries, 100% foreign ownership was authorized while still permitting foreign firms to profit from Code incentives.[4]

The principal Moroccan Government minerals offices included the following: (1) Office Chérifien des Phosphates (OCP), which had been owned by the Government since 1920 and had a complete monopoly on production, exploration, and transportation of phosphate; (2) Bureau de Recherches et de Participations Minières (BRPM), which was the Government's mining investment and research organization for minerals other than phosphate, and had the status of a private corporation; and (3) Direccion des Mines, de la Géologie et de l'Énergie, which was the Government's legal, research, and recording agency for minerals. Plans for investment of capital in mining enterprises were the responsibility of the Directorate of Mines. The Directorate issued mining research and exploitation permits and was under the Ministere du Commerce, de l'Industrie, des Mines et de la Marine Marchande.

PRODUCTION AND TRADE

Mineral production, excluding petroleum, natural gas, and cement, was valued at $680.5 million in 1977. Phosphate rock accounted for 85% of the total value received. Lead concentrate ($44.3 million), manganese ore ($8.8 million), iron ore ($7.5 million), and cobalt concentrate ($6.3 million) were the leading revenue earners after phosphate rock.

Phosphate rock production rose 12% to 17.6 million tons in 1977. Phosphate rock exports were up 1.1 million tons compared with those of 1976, but despite the tonnage increase, earnings from phosphate rock fell in 1977 to $536 million. Phosphate rock was valued at less than $35 per ton, compared with the $68 per ton price set by OCP at the height of the world phosphate boom in January 1975. The increase in phosphate rock exports was largely because Spain

Digitized by Google

almost doubled its intake of 2.6 million tons. Exports to France and Belgium also increased.[5] The first major arrangement for supply of Moroccan phosphate to the United States was made with the U.S. fertilizer company, Beker Industries. Exports to the United States were expected to increase. OCP also planned on increasing exports to Mexico through a barter deal with Fertilizantes Mexicanos S.A. (FERMEX), in which Mexican sulfur, ammonia, and cement would be exchanged for Moroccan phosphate rock. Phosphoric acid sales were predominantly to Western Europe (57%), India (19%), Brazil (17.7%), and Eastern Europe (6.4%). OCP also purchased over 160,000 tons of phosphoric acid (P_2O_5) for resale from producers in France and Spain, in an effort to enhance markets for expected increased Moroccan capacity scheduled to come onstream.

Exports totaling 25,145 tons of Bu Craa phosphate rock were resumed from El Aaiún in the fourth quarter of 1977 and went to Spain and Uruguay. Shipments from Bu Craa in 1976 totaled 277,000 tons and consisted mostly of beneficiated material from stocks. Phosphate rock concentrate stocks at El Aaiún were reported to be 206,000 tons on December 31, 1977. The conveyor belt between the mine at Bu Craa and El Aaiún was still out of action, but the company was expecting the 1978 production to increase.[6]

Iron ore exports were down for the second year, caused by the recession in the European iron and steel industry. The drop in iron ore sales, which occurred in the second quarter of 1977, brought about the near-closing of the mines at Nador. Some copper mines also reportedly closed because of low world market prices. Because of the low metallic content of the cobalt ores mined at Bou Azzer and because operations at Tamdrost were still in initial stages, cobalt production was down 49% in 1976 and increased only marginally in 1977. Because of a rise in price, however, cobalt revenues increased. The metal content of Morocco's 1977 cobalt production accounted for 5.3% of the world's total cobalt production.[7]

Morocco petroleum production increased to 22,100 tons in 1977 compared with 8,100 tons produced in 1976. About 90 million cubic meters of natural gas were produced for commercial use in 1977 compared with 80 million cubic meters for 1976. Imports of crude oil from the U.S.S.R. (about 600,000 tons per year) were expected to show a rapid increase from 1980 onward as a result of the barter agreement between the two countries for the development of the Meskala phosphate deposit. Imports of crude oil totaled 2.9 million tons in 1977 and came mostly from Iraq (56%), the U.S.S.R. (23.6%), Saudi Arabia (16.8%), and Iran (3.6%). Distillate fuel oil imports were 389,000 tons.

COMMODITY REVIEW

METALS

Antimony.—Morocco accounted for 2% of the total world antimony production from 12 operating mines in 1977. Société des Travaux et de Recherches Minières (SOTRATEM) operated the Timerdoudine mine, the largest of six mines in the Meknes Province south of Masseramane. The Timerdoudine was an underground mine producing from stibnite veins with quartz gangue in Paleozoic schists associated with microdiorite. SOTRATEM produced over 3,000 tons antimony concentrate from five mines in 1977. Beni Mezala mined antimony in the Tetouan district and produced around 350 tons of antimony concentrate (46% antimony) in 1977. A bilateral cooperation agreement was signed between Morocco and France that would allow the French Bureau de Recherches Géologiques et Minières (BRGM) to reevaluate the antimony potential of the central Hercynian Mountains of Morocco.[8]

Copper.—The principal operators of seven producing copper mines in the country comprised the following: (1) Société Minière Marocaine (SOMIMA), 74.88% owned by BRPM and the largest copper producer for 1977 with 6,950 tons of copper concentrate recovered. SOMIMA exploits mines at Talat N'Ouamane in Agadir district and at Ouansimi in the Tisnit Province. N'Ouamane was to produce 7,800 tons per year and was under development. (2) Soc. des Mines de Bou Skour (SMBS), owned 41% by BRPM, 33% by Omnium Nord-African (ONA), and 8% by BRGM of France. SMBS operates the Bou Skour mine, which was the second largest copper producer with 4,194 tons of copper concentrate in 1977. (3) Société de Developpement du Cuivre de l'Anti Atlas (SODECAT), 100% owned by BRPM, produced 3,957 tons of 34% copper concentrate from the Tazalaght and Assif Imider mines located in Agadir Province. An average of 250 grams silver was also recovered for each ton of concentrate.

Several copper mines, including Bleida, Assif-Imider, and Oumejrane mines, were under development beginning in 1976. Bleida mine, being developed by Société Minière de Bou Saffer, was owned 40% by BRPM, 40% by ONA, and 20% by MTS. The Bleida mine was planned to produce 15,000 tons copper metal by 1980. Reserves were estimated at 2.5 million tons of 6% copper. The washing plant was to handle 800 tons per day. An investment of $3.4 million was required. Assif-Imider mine, under development by SODECAT, started production in 1977 and was to eventually produce 2,500 tons per year of 50% copper concentrate and 1 gram per ton silver. An investment of $2.2 million was required. Oumejrane mine, 55% owned by BRPM, was expected to be producing 1,800 tons per year of cement copper (80% copper) by yearend 1977. Located in Zagora region near Ouarzazate, the reserves were estimated at 180,000 tons of 1.8% copper. B. Kersia mine, which was to have its development integrated with Ou-

Digitized by Google

mejrane, had a potential of 592,000 tons of 2.36% copper. The copper mine at Naour, owned 50% by BRPM, was under study.

A new copper smelter was to be located at Agadir and owned by Fonderie Marocaine de Cuivre (SOFOMAC), which was owned 65% by BRPM and 35% by Zellidja S.A. Arab Mining Co. was also to participate in financing the 30,000-ton-per-year copper smelter. Technical and economic feasibility studies were underway. Sulfuric acid will also be produced.

Iron Ore.—The Société d'Exploitation des Mines de Fer du Rif (SEFERIF), owned 100% by BRPM, was mining iron ore from four mines. The mines were located at Nador, where the Uixan No. 1 (two pits, one at Uixam and one at Axora, which was also underground), the Uixan No. 2 (F) and No. 2 (G) and Pellets mines were producing over 400,000 tons per year, mainly for export. The pit at Axora was estimated to have 24 million tons of 50% iron and 4% silica. The ore was magnetite with some pyrite, which was eliminated by roasting. Approximately 1,400 workers were employed at the iron mines. Steel plant operation by Société Nationale de Siderurgie (SONASID) was scheduled for 1981. The opening of the Nador iron and steel complex, anticipated by the new 5-year plan with capacity approaching 1 million tons of steel per year, was expected to be an important outlet for local iron ore production.

Lead and Zinc.—Morocco accounted for 3% of total world lead production in 1977. The numbers of operating lead and zinc mines included 36 lead and 14 zinc producers. Zellidja Société Anonyme, owned 19.5% by SNI, 31.3% by OCP, 6.6% by Penarroya-Maroc, 3.8% by Academie Francaise, 9% by Newmont Mining Corp., 5% by BNDE, 3.8% by AMI, and 21% by others, operated the Bou Beker mine, located south of Oujda. Compagnie Minière de Toussit (CMT), owned 50% by Compagnie Royale Asturienne des Mines (CRAM), 20% by SNI, 15% by Matran (Société Morocaine), 1% by Metal Afrique (Société Morocaine), 5% by Société Safari, 5% by Fonds Marocain de Placement, and 4% by Société Amrina, exploited the Beddiane and Oued Mekta mines of Oujda Province. Société Developpement Industrielle et Minière de la Haute Moulouya (SODIM), owned 50% by BRPM and 50% by Zellidja S.A, operated the Zeida mine in the Khenifra Province. Central d'Achat et Developpement de la Règion Minière du Tafilalet et de Figuig (CADETAF) is a miners' cooperative that operated several mines in Errachidia and Figuig Provinces. Société des Travaux et de Recherches Minières (SOTRATEM), owned 42.8% by Société Parminaf, 20% by Heritiers Barandi, 20% by Lazrek, 10% by Moukacha, 2.8 by% Guerar, 2.9% by Pascal, and 1.5% by Olivera, operated mines at Seksaoua, Timerdoudine, Touriti, and the Figuig district. Société des Mines Dj. Aouam (SMA), owned 33.33% by BRPM, 33.33% by CRAM, and 33.33% by Vieille, operated the Djebel Aouam mine in Meknes Province. Société Aouli, owned 64% by the BRPM, operated mines at Aouli and Mibladen.

The Bou Beker deposit, mined by Zellidja, was a Mississippi Valley type, occurring in veins and disseminations in limestones and dolomites. The underground mine produced about 11,000 tons per year of 60% zinc concentrate, but the mine was considered to have a limited life. Bou Beker ore occurred on both sides of the Algerian-Moroccan border, with most of the ore reserves on the Algerian side. A new addition was made to the treatment plant in 1976 to treat rejects, as well as a new tailings flotation plant. The crushing and milling plants have a 4,000-ton-per-day capacity.

Reserves were estimated at CMT's Oued Mekta mine to be 1.5 million tons of 12% lead. The underground mine was producing about 4,500 tons per month of 70% lead concentrate. Mining equipment was upgraded in 1976 to raise the capacity to 30,000 tons per year of concentrates. A gravimetric plant being installed as the treatment plant at Touissit was insufficient. Reserves at the Beddiane mine were estimated at 5 million tons of 16% lead. Production was at the rate of 1,500 tons per month in the underground mine at Beddiane.

The open pit mine at SODIM's Zeida mine was producing both lead and barite from reserves that were estimated at 11 million tons of 4% lead ore. Zeida was considered to be the mine most likely to carry out large-scale lead mining once Bou Beker was closed. In 1977, 54,748 tons of lead concentrate was produced at the Zeida mine.

Lead-zinc deposits in the Tafilalet area consisted of about 70 subvertical veins (about 40 have been worked) that were mineralized with galena, some sphalerite, and vanadinite with barite or siderite gangue. In Errachidia Province, there were 10 lead mines, all operated by small producers except the Tafilalet mine exploited by CADETAF. Most veins are less than 5 meters

Digitized by Google

wide. The regional formations are Upper Devonian schists with many volcanic injections. CADETAF was considering a joint construction project with Zellidja for a calamine and zinc oxide plant. There were six operating mines in the Figuig district, and the largest, the Tameslemt mine, was operated by SOTRATEM.

The SMA Djebel Aouam mine, in Meknes Province, was estimated to have ore reserves of 1.5 million tons containing 7.43% lead, 1.97% zinc, and 155 grams per ton silver. The Aouli mines produced 2,200 tons of lead concentrate in 1977.

The lead foundry, located at Oued El Heimer, built by Zellidja and Penarroya, and owned 26% by BRPM, was officially opened in June 1975. The smelter capacity was to be increased to 48,000-ton capacity by 1980. In 1977, it produced 33,436 tons of lead metal and 9,600 kilograms of silver. The smelter was to be supplied exclusively from ores of the CMT Beddiane and Oued Mekta mines. A new, 80,000-ton-per-year lead smelter was to be built near Meknes by Fonderies Chérifienne de Plomb (FCP), that will process the concentrates from the Zeida and Jebel Aouam mines. FCP was to be owned 75% by BRPM and 25% by the Arab Mining Company, which is based in Amman, Jordan.

Manganese.—Of the four producing manganese mines, the Imini mine was by far the largest, contributing over 90% of the total 113,547 tons of chemical-grade manganese produced in 1977. The undergound Imini mine was operated by the Société Anonyme Chérifienne d'Études Minières (SACEM), which was owned by BRPM (47.14%), Compagnie de Mokta (47.14%), IMETAL (3.19%), and ONA (2.5%). The manganese was hauled by truck to Marrakech and by train to Casablanca. The fourth washing plant was recently upgraded for greater recovery of ultrafines. The manganese deposits of the Anti-Atlas area, taking Ouarzazate as center, fill a large number of fractures in Paleozoic rocks. Braunite is dominant and the gangue is silica, barite, or more rarely, calcite. The Imini mine life was considered limited.

Pyrite and Pyrrhotite.—The Kettara mine was being exploited for pyrite and pyrrhotite by the Société du Exploitation Pyrrhotine de Kettara (SEPYK), owned by BRPM (47.4%), OCP (12%), Finances (39.2%), and CMM (1.4%). The sulfur produced was used by chemical and fertilizer plants at Safi, 120 kilometers away. The new Maroc Phosphore II complex was expected to consume 1,250,000 tons of sulfur and 320,000 tons of pyrrhotite. A concentrator, started in July 1972, raises the sulfur content from 25% to 33%. The ore body has a cap of hematite-limonite with pockets of ocher that is also recovered. The roasted pyrite was exported to European processers.

Uranium.—Negotiations were being carried out with several firms including three U.S. companies — Gulf Oil Corp., Westinghouse Electric Corp., and the Uranium Recovery Corp. — for extracting uranium from phosphate rock. A new Atomic Energy Commission was to oversee development of the uranium extraction plants. Uranium reserves in phosphate were estimated at 18 million tons.[9] Two extraction units were being contemplated and would be associated with two of the three acid plants in operation at Safi, Maroc-Chimie 1 and 2, and Maroc Phosphore 1. Extraction of uranium is estimated to yield about 1 pound of uranium oxide per ton of phosphoric acid produced. With the uranium produced, Morocco was planning to establish its first nuclear powerplant, probably of 1,300-megawatt capacity. This plant would consume about one-third of the potential uranium production. The remainder would be exported.[10] The BRPM announced the discovery of interesting uranium occurrences by drilling in Upper Moulouya, east of Zeida (Middle Atlas Mountains) and in the Marrakech area at Wafaga (High Atlas).

NONMETALS

Barite.—Barite production was 149,920 tons in 1977; this compares with 129,215 tons produced in 1976. This production originated from 44 operating mines, among which the principal producer was Compagnie Marocaine des Barytes (COMABAR), owned 50% by BRPM. COMABAR produced 56,703 tons from the Jebel Irhoud mine of Safi Province. The Jebel Takoucht and Targa mines, owned by SMIDEL, have production capacity of 35,000 tons yearly and were the two largest barite mines of the 19 operating in Marrakech Province. The Mining and Minerals Division of Chromalloy joined SMIDEL in its barite operation near Imigdal. Total combined capacity of SMIDEL's grinding plants, located at Marrakech and Casablanca, was 45,400 tons per year. The Tessaout deposits of Somatrex (a subsidiary of Marogypse) produced about 35,000 tons per year of crude barite. Ste. de Recherches Minières NADIA mines barite

Digitized by Google

at Asni, Imlil. Barite concentrate was also recovered by Zellidja S.A. from its lead-barite ore at Zeida near Midelt at the rate of about 10,000 tons barite per year.

Cement.—The construction boom was showing no signs of slowdown, and cement demand was high. Local consumption of cement was expected to exceed 10 million tons per year by 1985. Moroccan cement production increased 23% in 1977 to a total of 2.9 million tons, or an average of 239,000 tons per month.[11] Loans for two new cement plants, one at Oujda and one at Temara, were secured. The Arab Fund for Economic and Social Development was to loan $27 million out of the total $67 million required for construction of the Cimenterie de l'Oriental cement plant at Oujda. Expected to be operating by 1978, the Oriental plant was to have an initial capacity of 600,000 tons per year and a total of 1,200,000 tons per year by yearend 1979. The Asment de Temara S.A. plant, under construction near Rabat, was to cost around $61.7 million and was to be funded by an international assortment of credit institutions. Financing was to come from the International Finance Corp. (IFC) of the World Bank, the Arab Investment Co. of Saudi Arabia, the Islamic Development Bank, the Chemical Bank of New York, the Eximport Bank, and BNDE of Morocco. Expected to be operating by 1978, the Temara plant was to have an initial 300,000-ton-per-year capacity increasing to 690,000 tons per year by 1979.

Additional cement capacity was being constructed at the operating plants of (1) Ste. des Ciments de Marrakech S.A. at Marrakech (208,000 tons per year to 500,000 tons per year); (2) Cementos Marroquies C.M.A. at Tetuan (180,000 tons per year to 250,000 tons per year); (3) Cementos Tanger S.A. at Tanger (100,000 tons per year to 250,000 tons per year); and (4) Ste. des Ciments Artificiels de Meknes, at Meknes, (635,000 tons per year to 720,000 tons per year). A total of nine cement plants were to be operating by yearend 1978 with an estimated total yearly capacity of 3.9 million tons increasing to 4.8 million by yearend 1979.

Fluorite.—The Société Anonyme d'Enterprises Minières (SAMINE), owned by BRPM (40%), ONA (26%), Ugine Kuhlmann (20%), and and Preussag (14%), operated the fluorite mine at El Hammam. Located in the Moyen Atlas Mountains in Khemisset Province, the El Hammam mine was reactivated in 1969 but has operated for the past several years at about two-thirds of its capacity (60,000 tons) because of depressed world markets. An increase in exports during 1977 allowed some drawdown in stocks, and development plans were anticipating an increase in production to 80,000 tons by 1980. A new shaft was expected to be in operation by 1979. The New Rouif vein was being prepared for mining and assayed 34.8% fluorite, 14.1% barite, 1.9% lead, and 60 grams per ton silver.

Phosphate Rock.—Moroccan Government estimates of ore reserves were being given as 58 billion tons exploitable with current mining technology and a possible production range of 80 to 200 million tons per year for the future. Development plans were envisaged that included phosphate rock production of 40 million tons per year by 1987 and 70 million tons per year by 1990. In addition to increased mine and port handling capacities, additional development of processing facilities were also planned. In 1977, only about 10% of Moroccan phosphate rock was being processed in the country; this was to be expanded to 30% by 1985. The Government was to spend over $2 million for new chemical-processing capacity over the 1978-85 period, in order to accomplish the 30% domestic conversion target.

Phosphate rock production continued below capacity in 1977, but was up 12% compared with that of 1976, and down 12% from the record high production of 19.7 million tons in 1974. The two established mines at Khouribga and Youssoufia in central Morocco had a combined production capacity of 21 million tons per year. Fosfatos de Bu Craa in the Western Sahara had a capacity of 5 million tons per year. There were two mines being developed at Benguerir, expected to come onstream in the early 1980's and to reach 9.75 million tons per year by 1990. A third new mine was being built at Sidi Hajjaj, scheduled to come onstream by 1987 with 3 million to 5 million tons per year production capacity, eventually producing 10 million tons per year. A new mining site at Youssoufia was to contribute about 1 million tons per year. A new mine at Meskala was under negotiations with the U.S.S.R. and would produce 10 million tons per year. Guerrilla actions in the western Sahara was preventing a long-term development program.

At yearend, terms for a long-term barter agreement involving development of the Meskala deposits were being finalized with

Digitized by Google

the U.S.S.R. The arrangements were to cover a 30-year period, would initially involve a Soviet investment of some $2 billion, and would eventually result in an annual export of some 10 billion tons of phosphate rock, triple-super-phosphate, and phosphoric acid to the U.S.S.R. The Soviets were to develop and equip the mine, which was reported to have reserves of 9 billion tons with 72% bone phosphate of lime. A new harbor at Essouira and a 60-kilometer railroad were also to be constructed. The project would take 8 to 10 years to complete. When the Soviet investment is paid, the phosphates will continue to be exported in exchange for Soviet oil, timber, chemical products, and mining equipment. Phosphate prices would be renegotiated every year, and a safeguard clause would prevent resale by the Soviets. Phosphate rock prices dropped from $68 per ton in 1975 to nearly $30 per ton in 1977. The agreement would also help Morocco adjust the trade deficit with the U.S.S.R. that had widened since oil prices rose dramatically in 1974. In 1976, petroleum accounted for about 85% of the value of Soviet exports to Morocco.[12]

A $230 million contract was awarded to Heurtey Industries of France to build the Maroc Phosphore II plant near Safi, scheduled for completion in 1981. The complex will consist of three sulfuric acid units with total capacity of 1.9 million tons per year, and three phosphoric acid units with total capacity of 550,000 tons per year. All of the sulfuric acid units were to use Monsanto Enviro-Chem Inc.'s single-absorption design, mist eliminators, and vanadium catalysts. The Uhde France Company would supply the three phosphoric acid plants, which would use the Nissan process. The plant would process 1.7 million tons per year of crude phosphates and 530,000 tons of sulfur per year. A group of banks led by Frab Bank International were to provide the loan for the plant construction.

The Saudi Development Fund (SDF) loaned the Moroccan Government $100 million, of which $33.9 million was to be used in establishing the new phosphate export port at Jorf Lasfar, south of Casablanca. The port would handle exports from the Beguerir and Sidi Hajjaj expansions.

OCP became the principal shareholder in the French chemical- and gas-shipping group, Gazocean S.A., by increasing its stockholding to 25%. The Moroccans also had the option of increasing their shares to 42% by July 1, 1980. The Moroccan company, Marphocean (owned 35% by CP and 25% by Gazocean), was to take over financing and operations of the two specialized phosphoric acid carriers that were originally ordered by Gazocean. One carrier was ready for service and the other was to be delivered by yearend 1977. Marphocean would then become the largest phosphoric acid shipper in the world with a six-ship fleet and total shipping capacity of 100,000 tons.[13]

Western Sahara.—Destruction of power pylons linking the Bu Craa mine with a power station 107 kilometers away and several sections of the conveyor belt effectively kept the mine unproductive for most of the year. Through much of 1977, Fosfatos de Bu Craa (Fosbucraa), owned 65% by OCP and 35% by Spain's Instituto Nacional de Industria (INI), was using trucks to transport the rock to port El Aaiun, 100 kilometers away. The company was hauling 2,000 tons per day from a stockpile at the mine site to the port in heavily guarded convoys. Only 450 of the original 1,500 Spanish mine workers were reported to have remained on the job after OCP took over controlling share and guerrilla warfare began.[14] In the closing months of 1977, OCP began to operate the Fosbucraa beneficiation plant at El Aaiún, producing some 230,000 tons of concentrate.

MINERAL FUELS

Bituminous Shale.—Research on bituminous shale at Timhadit and Tarfaya was being conducted by BRPM and the Oil Shale Corp. of the United States. Existence of several billion metric tons of oil shale was verified with drilling, and studies to determine the oil content were being conducted. A delegation of Spanish experts was also interested in the potential of these deposits and had visited Morocco to discuss them.

Coal.—Situated in northern Morocco, the Jerada anthracite deposit covered a surface of about 100 square kilometers and was estimated to have reserves of 100 million tons. Discovered in 1927, exploitation did not start until several years later by Société Cherifienne des Charbonnages de Djerada (SCCD), which in 1977 was owned 98.89% by BRPM. In 1977, two pits were being exploited, and a new pit under development was expected to attain a capacity of 1 million tons by 1980. The coal was used locally for fuel in cement plants, sugar refineries and other small industries, and for generation of electricity. Only limited quantities were

Digitized by Google

available for export. Approximately 5,000 workers were employed at the coal mines.

Petroleum.—Morocco awarded offshore drilling permits to several oil consortiums off the coast of the Western Sahara, between El Aaiún and Boujdour, and off Essaouira for 4,000 square kilometers on the Sminou permit. Fourteen exploration permits were granted for the Western Sahara during 1977 and early 1978. A consortium made up of BRPM, Phillips Petroleum, and British Petroleum Co., Ltd. (BP) head 10 of the offshore Sahara exploration permits. Getty Oil and Agip S.p.A. were to join Phillips and BP in prospecting off Essaouira. BRPM had already discovered small oil and gas deposits on the mainland near Essaouira. The petroleum reserves at Essaouira were estimated to be about 1 billion cubic meters, and an announcement of a new deposit at Toukimt was also confirmed. Sun Oil found petroleum shows near Ifni, and a second exploration effort was to be made near Agadir at yearend 1977.[15] The Government was also encouraging petroleum exploration in the deep sedimentary basins of the Rif region where it was hoped that new geophysical techniques would enhance the prospects of locating petroleum and gas deposits. Natural gas reserves were estimated to be about 1 billion cubic meters, which at the present rate of production would last 11 years.[16]

Most domestic refined needs were produced by the Government-owned refinery at Société Anonyme Marocaine de l'Industrie du Raffinage (SAMIR), located at Mohammedia. An extension was being financed by the Saudi Arabian Monetary Agency, which would increase the refinery capacity from 2,250,000 tons per year to 5,750,000 tons per year. An agreement was signed on March 10, 1977, for a loan of $28.3 million.[17] Refinery input for 1977 was 2.9 million tons of crude oil, most of which was imported. The Société Nationale des Produits Petroliers (SNPP) reported oil product sales had increased 8.7% over 1976. The country was 80% self-sufficient in refined products; the remaining 20% was imported. New lubricant and bitumen plants were to be built at Mohammedia under the next development plan, while a project for a third refinery with 4 million tons per year capacity was under study for Jorf Lasfar.

The Mineral Industry of Mozambique

By David E. Morse[1]

The mineral industry of Mozambique, as well as most sectors of the nation's economy, struggled through a difficult year in 1977. Important factors contributing to the country's economic contraction were the exodus in 1975 and 1976 of trained managers and technically skilled personnel, disruptions resulting from the restructuring of the society to meet the postindependence framework of national goals, continued low worker productivity, and the loss of foreign exchange earnings that had been derived from the transport of Southern Rhodesian imports and exports prior to the closure of the border in March 1976. Foreign exchange earnings also declined because of the fall in the number of Mozambicans working in the Republic of South Africa. At the end of 1977, there were 34,000 Mozambicans working in the Republic of South Africa, compared with an average of 100,000 in 1975 and approximately 65,000 in 1976.

Despite stringent import restrictions, the 1977 balance-of-trade deficit escalated to $345 million owing to export stagnation and a 25% increase in imports. Coal, cement, refined petroleum products, and tantalite-microlite concentrates were Mozambique's most important mineral exports. Prime contributors to the large trade deficit in 1977 were the depressed level of the nation's agricultural exports and the larger volume of imported crude petroleum, foodstuffs, steel, and textiles.

The Cabora-Basa Gorge hydroelectric project, which spans the Zambezi River in the central Tete District near Songo, began commercial production of electric power in March. All of the electricity generated was exported to the Republic of South Africa over a 1,400-kilometer-long, dual 530-kilovolt transmission line. During 1977, Zambeze Consorcio Hidro-Electrico Lta. (Zamco) continued to erect two 405-megawatt generators in the southern power station to complement the three operating generators of equal rating. The 163-meter-high dam and all other major structures had been completed, and Zamco planned to finish work on the remaining generators and powerhouse equipment in 1979. Although the project provides jobs for local workers, tax income for the Government, and a means for regulating floods, Mozambique will receive the revenue from electricity generated at Cabora-Basa only after the creditors have been paid, which is to be in 1992. The dam was designed so that four additional 405-megawatt generators could be installed in a power station in the north, giving the project an ultimate capacity of 3,600 megawatts.

During 1977, the Government took action to attract and reassure foreign investors. Decree Law 18-77, promulgated in April, outlined the terms of foreign participation and guaranteed investors the rights of profit repatriation and protection from nationalization.

Total do	3,146	2,785	3,592

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, other crude construction materials and additional varieties of gem and ornamental stones presumably are produced, chiefly for local consumption, but available information is inadequate to make reliable estimates of output levels.

[2]Less than 1/2 unit.

[3]Revised to none.

COMMODITY REVIEW

METALS

Bauxite.—No bauxite production was reported by the Mozambique Department of Geology and Mines for 1977. The Alumen mine had produced 5,000 to 7,000 tons per year of bauxite grading 62.3% Al_2O_3, 3% SiO_2, and 2.22% Fe_2O_3 until 1974. Production in 1975 was 2,175 tons. Output in 1976, estimated at 2,000 tons, was affected by the closure of the Southern Rhodesian border, as Southern Rhodesia had been the largest consumer of the mine's output. Reserves at the mine at Melange near Manica in the Vila Pery District were reported to be an estimated 60 million tons of bauxite averaging 44% Al_2O_3.

Copper.—The Edmundian copper mine,

Digitized by Google

located between Manica and the Southern Rhodesian border in the Vila Pery District, was abandoned by its owners following the closure of the Southern Rhodesian border in 1976 and was subsequently nationalized by the Mozambique Government. The mine did not operate throughout 1977; the Government announced plans to reactivate the operation in early 1978. A production level of 230 tons per month of chalcopyrite concentrate was anticipated when full operation is restored in mid-1978.

Iron Ore.—The Swedish Aid Authority, acting on a request by the Mozambique Government, engaged Luossavaara-Kiirunavaara AB (LKAB) International to carry out primary investigations on the Honde iron ore deposits in west-central Mozambique. The deposits, located along the banks of the Honde River, are composed of a number of itabirite outcrops containing an estimated 100 million tons of ore with an average grade of 38% iron.

NONMETALS

Cement.—Production of cement in Mozambique's three plants increased 49% over that of 1976 but remained well below the 990,000-ton-per-year installed capacity. Mozambique's cement plants were located at Matola near Maputo in the south, at Dondo near Beira in central Mozambique, and at Nacala (a small unit) in the less populous north. All of the plants were coal-fired, and the effect on output by the closure of the Moatize coal mine in August was not known. Approximately 50,000 tons of cement was exported to Tanzania in 1977.

Fertilizer Materials.— Mozambique's Government-managed fertilizer plant, Quimica Geral at Matola, continued to operate below capacity owing to a lack of spare parts and a shortage of trained technicians. The Government planned to bring the plant's sulfuric acid unit to designed output and double ammonium sulfate production in 1978.

MINERAL FUELS

Coal.—Mozambique's only large coal-mining operation, owned by Cia. Carbonifera de Moçambique S.A.R.L. (CCM), sustained a major coal dust and methane gas explosion on August 3 in the company's Chipanga No. 3 mine. The disaster, coupled with a loss of production from Chipanga No. 7 because of excessive water and the September 1976 disaster in Chipanga No. 6, effectively terminated coal-mining operations at CCM's Moatize concession, located 30 kilometers east of Tete in the Tete District. Coal reserves in CCM's 31-square-kilometer concession area were reported at 400 million tons. Two West German companies were conducting a feasibility study in 1977 to determine the viability of a 2-million-ton-per-year opencast operation in a section of the company's concession area.

Petroleum.—No petroleum exploration activity was reported in Mozambique in 1977, and no petroleum concessions were in force during the year. The Government nationalized the nation's only oil refinery at Matola and assumed control of petroleum product marketing and distribution on May 1. Empresa Nacional de Petroleos de Mozambique was established to operate the refinery and market petroleum products. Most of the crude oil processed at the refinery was imported from Iraq. Refinery output increased 29% in 1977 but was only 62% of plant capacity.

The Mineral Industry of the Netherlands

By William F. Keyes[1]

Expectations early in the year for continued recovery of the Dutch economy were not realized. Unemployment and inflation again rose, and for the first time since 1970, the balance of payments on current account was in deficit. The estimated real growth of the gross national product was revised downward to 3% per year for 1977 and 1978.

The condition of the economy, which was shared by the mineral extractive and processing industries, was a reflection of the worldwide economic slowdown, but numerous analysts pointed to the influences of the "Dutch disease," a popular term for the effects of the massive production of natural gas on the economy.

During the 4 years before gas revenues began to flow in regularly, the Netherlands averaged an annual trade deficit of about $130 million;[2] since 1972, the balance of trade has averaged a $2 billion annual surplus. The revenues were used to raise wages, social benefits, and the standard of living generally, but were not used proportionately in industrial modernization. A resultant high inflation rate affected industry competitiveness and led to unemployment.

The Netherlands remained a significant producer of natural gas in 1977; there was also appreciable production of petroleum, salt, and cement. Among mineral products derived from imported ores were significant amounts of aluminum, iron and steel, lead, zinc, and petroleum products. Developments in the mineral industry during the year included a decision to cut back on steel expansion plans, the beginning of imports of natural gas (in spite of a domestic surplus), and a continuing increase in offshore gas supplies.

PRODUCTION

The major extractive industries, including natural gas, salt, and petroleum, showed little change in production in 1977, but the indexes of the mineral-processing industries declined: Base metals including steel, from 111 to 107, and petroleum refining, from 111 to 109. Table 1 gives production of mineral products for 1975-77.

Table 1.—Netherlands: Production of mineral commodities

(Thousand metric tons unless otherwise specified)

Commodity[1]		1975	1976	1977[p]

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, the Netherlands presumably produces a variety of crude construction materials (clays, stone, and gravel), but production is not reported and available information is inadequate to make reliable estimates of output levels.

[2]Series revised to represent total national production; data published in previous editions represented marketed production only, not including production by companies for their own use.

[3]Coke oven and blast furnace gas only.

TRADE

The Netherlands continued to be a major importer and consumer of raw and semifinished mineral products, including petroleum, iron and steel, nonferrous metals, and fertilizers. As shown in table 4, the country purchased large amounts of U.S. molybdenum ore, gem diamond, phosphate rock, coal, and certain petroleum products. It shipped to the United States sizable quantities of iron and steel semimanufactures, cut diamond, zinc, and certain other petroleum products.

METALS —Continued			
Manganese:			
Ore and concentrate	26,030	31,854	France 7,466; West Germany 5,214.
Oxide	102	63	Italy 45.
Mercury 76-pound flasks	1,247	2,292	West Germany 783; Iran 319.
Molybdenum metal including alloys, all forms	191	137	Belgium-Luxembourg 59; West Germany 34; Italy 20; United States 13.
Nickel:			
Ore and concentrate	324	392	West Germany 384.
Matte, speiss, similar materials	324	2,930	West Germany 750; Italy 743; Japan 743.
Oxide and hydroxide	38	83	West Germany 42; Belgium-Luxembourg 33.
Metal including alloys:			
Scrap	2,461	3,933	United Kingdom 1,496; West Germany 1,071; Spain 370.
Unwrought	3,713	2,538	Japan 743; Italy 740; West Germany 366.
Semimanufactures	4,788	3,764	Sweden 3,341.
Platinum-group metals including alloys, all forms troy ounces	5,691	7,073	West Germany 3,826; Switzerland 868; Japan 772.
Selenium, elemental	4	23	West Germany 16; Italy 2; Spain 2; United States 2.
Silver metal including alloys, all forms thousand troy ounces	12	7,423	Belgium-Luxembourg 4,268; France 1,762; Switzerland 322.
Tellurium and arsenic, elemental	30	50	France 41; Italy 5.
Tin:			
Oxide	9	4	Romania 3; Belgium-Luxembourg 1.
Metal including alloys:			
Scrap	434	742	United Kingdom 291; Belgium-Luxembourg 174; West Germany 133.
Unwrought	1,135	1,439	West Germany 617; Belgium-Luxembourg 334; United Kingdom 268.
Semimanufactures	523	583	West Germany 266; Belgium-Luxembourg 179.
Titanium dioxide	18,927	21,120	West Germany 4,420; France 3,530; Italy 3,176; Belgium-Luxembourg 2,896.
Tungsten:			
Ore and concentrate	1,254	1,239	West Germany 237; Switzerland 165; United Kingdom 165.
Metal including alloys, all forms	192	130	Belgium-Luxembourg 84; West Germany 24.
Zinc:			
Ore and concentrate	28,875	24,162	Belgium-Luxembourg 22,018; France 2,123.
Oxide	7,456	8,476	Belgium-Luxembourg 2,052; West Germany 957.
Metal including alloys:			
Scrap	7,457	5,158	West Germany 1,515; Belgium-Luxembourg 1,184; Pakistan 1,157.
Dust (blue powder)	1,230	1,632	NA.
Unwrought	90,247	129,078	United Kingdom 66,764; West Germany 18,175; France 12,850.
Semimanufactures	2,419	3,832	West Germany 2,902; Belgium-Luxembourg 433; France 229.
Other:			
Ores and concentrates	74,247	47,356	West Germany 14,178; France 7,752; United Kingdom 7,636.
Base metals including alloys, all forms	1,767	3,234	West Germany 2,228; United Kingdom 306; France 227.
Ash and residue containing nonferrous metals:			
Aluminum[3]	6,186	8,217	West Germany 4,962; France 3,255.
Lead	5,624	3,385	West Germany 1,084; Belgium-Luxembourg 1,063; Denmark 770.
Zinc	9,747	14,784	West Germany 6,904; Belgium-Luxembourg 4,517.
Other[3]	11,384	10,473	West Germany 4,507; Sweden 2,926.
Oxides, hydroxides, peroxides of metals	12	162	West Germany 64; United States 33; Turkey 24; France 18.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc.	5,062	6,809	West Germany 3,076.
Dust and powder of precious and semiprecious stones, including diamond thousand carats	2,390	756	West Germany 175; Japan 127; United States 95; Sweden 89.

Table 2.—Netherlands: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Abrasives, natural, n.e.s. —Continued			
Grinding and polishing stones	2,569	2,884	West Germany 803; United Kingdom 534; Belgium-Luxembourg 375.
Asbestos	189	199	NA.
Barite and witherite	81,568	103,021	West Germany 46,940; U.S.S.R. 24,197; East Germany 19,264; Norway 10,957.
Borates, crude, natural	336,722	327,132	West Germany 73,776; France 59,733; United Kingdom 55,299.
Cement	205,967	203,175	West Germany 101,623; Belgium-Luxembourg 62,776; Saudi Arabia 16,807.
Chalk	27,193	31,168	Belgium-Luxembourg 30,900.
Clays and clay products:			
Crude:			
Kaolin	52,192	71,535	Belgium-Luxembourg 69,754.
Refractory	3,370	5,214	Belgium-Luxembourg 3,241; United Kingdom 546.
Other, including bentonite	125,338	118,945	West Germany 75,416; Belgium-Luxembourg 28,341.
Products:			
Refractory (including nonclay brick)	32,676	38,650	West Germany 9,697; France 6,660; Republic of South Africa 3,477.
Nonrefractory thousand tons	671	743	West Germany 494; Belgium-Luxembourg 210; France 16.
Diamond, not set or strung, except dust and powder thousand carats	1,478	5,149	United Kingdom 2,706; Ireland 777; United States 522.
Diatomite and other infusorial earth	222	207	West Germany 64; Ghana 48; Nigeria 29.
Feldspar, fluorspar, leucite	421	2,383	Belgium-Luxembourg 1,502; Greece 595.
Fertilizer materials:			
Crude:			
Phosphatic	25,998	73,696	West Germany 39,823; Belgium-Luxembourg 25,029; France 5,134.
Other	44,891	82,569	Belgium-Luxembourg 58,539; West Germany 12,811; France 10,863.
Manufactured:			
Nitrogenous thousand tons	2,031	2,604	United States 562; France 259; India 244.
Phosphatic (including Thomas slag) do	216	187	France 68; West Germany 42; Belgium-Luxembourg 17.
Potassic (K_2O content)	2,773	705	United Kingdom 315; Tunisia 147; West Germany 107.
Other, including mixed thousand tons	731	788	France 338; West Germany 48; Belgium-Luxembourg 20.
Ammonia, anhydrous do	678	546	Belgium-Luxembourg 194; France 91; United Kingdom 74; Ireland 69.
Graphite, natural	217	493	West Germany 254; United Kingdom 170.
Gypsum and plasters	11,081	13,538	Belgium-Luxembourg 13,083.
Lime	3,834	3,875	NA.
Magnesite	39,086	36,029	West Germany 18,296; Belgium-Luxembourg 4,144.
Mica	1,143	543	West Germany 135.
Pigments, mineral, including processed iron oxides	2,301	3,454	West Germany 1,653; United Kingdom 689.
Precious and semiprecious stones, except diamond kilograms	25,050	62	West Germany 14.
Salt thousand tons	1,897	2,072	West Germany 647; Belgium-Luxembourg 533; Sweden 474.
Stone, sand and gravel:			
Dimension stone:			
Unworked and partly worked	19,987	4,396	West Germany 2,937; Belgium-Luxembourg 812.
Worked	9,261	10,654	West Germany 7,363; Belgium-Luxembourg 2,733; Norway 245.
Dolomite	19,147	14,161	West Germany 7,279; Belgium-Luxembourg 5,498.
Gravel and crushed stone thousand tons	333	464	Belgium-Luxembourg 283; West Germany 181.
Limestone	2,554	3,163	Belgium-Luxembourg 2,984.
Quartz and quartzite	11,275	10,570	West Germany 6,918; Belgium-Luxembourg 2,491.
Sand, excluding metal bearing thousand tons	8,578	11,207	Belgium-Luxembourg 10,756.
Sulfur:			
Elemental	7,038	2	NA.
Sulfur dioxide	720	862	Belgium-Luxembourg 191.
Sulfuric acid	164,265	140,066	Belgium-Luxembourg 42,885; West Germany 14,302.

Table 2.—Netherlands: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Talc and steatite	1,556	2,051	Italy 693; Belgium-Luxembourg 515; West Germany 327.
Other:			
Oxides and hydroxides of magnesium, strontium, barium	205	564	West Germany 329; Portugal 79.
Slag, dross, and similar waste, not metal bearing:			
From iron and steel manufacture thousand tons	65	87	West Germany 80.
Other do	84	64	Belgium-Luxembourg 40; United Kingdom 10; France 7.
Unspecified do	210	229	West Germany 80; Belgium-Luxembourg 71; France 65.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	5	31	NA.
Carbon black	67,807	77,706	France 38,583; West Germany 17,260; Belgium-Luxembourg 10,246.
Coal and coal briquets:			
Anthracite and bituminous coal thousand tons	287	460	West Germany 317; Belgium-Luxembourg 122; France 17.
Briquets of anthracite and bituminous coal	NA	4,531	Belgium-Luxembourg 4,483.
Lignite thousand tons	--	1,165	NA.
Coke and semicoke do	653	659	France 343; Belgium-Luxembourg 141; West Germany 97.
Gas:			
Manufactured do	NA	222	Belgium-Luxembourg 163; United Kingdom 31.
Natural billion cubic feet	1,821	2,026	West Germany 979; Belgium-Luxembourg 426; France 386.
Hydrogen, helium, rare gases	15,449	20,688	West Germany 9,323; Belgium-Luxembourg 6,248; France 2,544.
Peat and peat briquets thousand tons	58	82	Belgium-Luxembourg 57; France 17; West Germany 7.
Petroleum:[4]			
Crude thousand 42-gallon barrels	5,439	--	
Refinery products:			
Gasoline do	60,843	75,404	Belgium-Luxembourg 8,322; Sweden 2,730; Denmark 2,499.
Kerosine and jet fuel do	19,274	21,103	United Kingdom 4,479; Denmark 2,315; Sweden 652.
Distillate fuel oil do	102,292	110,505	West Germany 66,424; Belgium-Luxembourg 14,629; United Kingdom 4,335.
Residual fuel oil do	122,411	125,514	Belgium-Luxembourg 16,290; West Germany 14,519; Denmark 7,532.
Lubricants do	3,057	3,681	United Kingdom 549; Belgium-Luxembourg 475; Sweden 271.
Other:			
Liquefied petroleum gas do	5,290	5,232	Belgium-Luxembourg 3,028; Portugal 777.
Mineral jelly and wax do	504	512	West Germany 183; Morocco 135; United Kingdom 109.
Bituminous mixtures do	242	309	Sweden 85; West Germany 79; Norway 73.
Unspecified do	4,200	4,073	West Germany 1,290; Denmark 772; Norway 553.
Total do	318,113	346,333	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals thousand tons	459	470	West Germany 200; United Kingdom 123; France 39.

NA Not available.
[1]Excluding monetary gold.
[2]Includes sponge iron, shot, grit, pellets, powder, spiegeleisen, and ferromanganese.
[3]Exports to Belgium-Luxembourg are included in "Other."
[4]Including bunkers.

Table 3.—Netherlands: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite	152,732	130,828	Greece 116,986; Guyana 13,173.
Alumina	576,816	547,233	Surinam 186,253; Greece 169,090; France 132,121.
Metal including alloys:			
Scrap	24,728	28,341	West Germany 18,828; Belgium-Luxembourg 2,648; France 2,203.
Unwrought	121,389	162,108	Norway 73,599; United Kingdom 36,294; West Germany 30,399.
Semimanufactures	63,885	97,027	West Germany 41,464; Belgium-Luxembourg 24,364; France 10,275.
Antimony metal including alloys, all forms	43	47	Italy 20; Belgium-Luxembourg 14; United Kingdom 6.
Arsenic oxides and acids	740	645	France 471; Belgium-Luxembourg 71; People's Republic of China 68.
Beryllium metal including alloys, all forms	4	2	West Germany 1.
Bismuth metal including alloys, all forms	130	49	Belgium-Luxembourg 18; China 4; Japan 4; United Kingdom 4.
Cadmium metal including alloys, all forms	73	169	Japan 50; West Germany 38; Belgium-Luxembourg 25.
Chromium:			
Chromite	38,834	21,022	Mozambique 12,945; Republic of South Africa 7,837.
Oxides and hydroxides	880	1,118	West Germany 507; U.S.S.R. 310; France 214.
Cobalt:			
Oxides and hydroxides	186	412	Belgium-Luxembourg 265; United Kingdom 120.
Metal including alloys, all forms	76	84	Belgium-Luxembourg 36; West Germany 23; France 10; United States 8.
Columbium and tantalum: Tantalum	3	1	NA.
Copper:			
Copper sulfate	2,520	3,913	Belgium-Luxembourg 1,656; France 1,105; U.S.S.R. 440.
Metal including alloys:			
Scrap	11,975	--	
Unwrought	49,529	60,596	Belgium-Luxembourg 19,578; U.S.S.R. 7,509; Chile 7,451.
Semimanufactures	65,013	74,075	Belgium-Luxembourg 30,241; West Germany 29,330; France 7,934.
Gold[1] thousand troy ounces	2,409	1,646	West Germany 595; Switzerland 403; United States 258; France 252.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	7,369	6,528	Sweden 1,711; Brazil 1,672; Canada 1,184.
Metal:			
Scrap do	205	199	West Germany 103; Belgium-Luxembourg 40; United Kingdom 36.
Pig iron[2] do	106	104	West Germany 31; Norway 23; France 12.
Ferroalloys do	47	53	Norway 19; France 8; West Germany 8.
Steel, primary forms do	372	528	Belgium-Luxembourg 262; Norway 159; West Germany 72.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	1,140	1,461	Belgium-Luxembourg 675; West Germany 523; France 147.
Universals, plates, sheets do	1,059	1,090	Belgium-Luxembourg 455; West Germany 421; France 56.
Hoop and strip do	32,368	238	West Germany 165; Belgium-Luxembourg 32; France 30.
Rails and accessories do	47	43	West Germany 31; France 12.
Wire do	82	121	Belgium-Luxembourg 66; West Germany 48; France 3.
Tubes, pipes, fittings do	784	603	West Germany 384; France 73; Belgium-Luxembourg 55.
Castings and forgings, rough do	13	12	West Germany 6; Belgium-Luxembourg 5.
Lead:			
Oxides	9,378	11,971	West Germany 5,944; France 3,069; Belgium-Luxembourg 2,411.

See footnotes at end of table.

Table 3.—Netherlands: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Lead —Continued			
Metal including alloys:			
Scrap	19,291	9,805	West Germany 5,772; France 2,023.
Unwrought	43,879	51,857	United Kingdom 15,554; Belgium-Luxembourg 12,331; Australia 10,547.
Semimanufactures	2,664	2,562	Belgium-Luxembourg 1,415; West Germany 797.
Magnesium metal including alloys:			
Scrap	948	1,230	West Germany 538; France 174; Norway 130.
Unwrought	2,555	1,907	Norway 739; United States 472; France 418.
Semimanufactures	137	141	France 51; West Germany 40; United Kingdom 24.
Manganese:			
Ore and concentrate	47,330	45,654	Belgium-Luxembourg 4,110; West Germany 1,099; France 398.
Oxide	789	797	Belgium-Luxembourg 717.
Mercury 76-pound flasks	2,727	3,017	Algeria 1,421; Spain 725; Italy 406.
Molybdenum metal including alloys, all forms	172	201	West Germany 68; France 65; Belgium-Luxembourg 35.
Nickel:			
Matte, speiss, similar materials	384	446	Cuba 439.
Metal including alloys:			
Scrap	2,396	1,576	West Germany 853; United Kingdom 288; United States 153.
Unwrought	4,394	3,605	United Kingdom 1,103; Republic of South Africa 694; Cuba 439.
Semimanufactures	4,261	3,696	Sweden 1,828; West Germany 897; Switzerland 259.
Platinum-group metals including alloys, all forms thousand troy ounces	231	35	West Germany 12; Switzerland 8; United Kingdom 7; France 4.
Silver metal including alloys, all forms do	337	681	West Germany 567; United States 102.
Tellurium and arsenic, elemental	29	59	United States 50; Sweden 5.
Tin:			
Ore and concentrate	3,083	2,882	Republic of South Africa 2,014; Peru 697; Burma 147.
Oxide	41	82	United Kingdom 52; West Germany 30.
Metal including alloys:			
Scrap	540	771	West Germany 539; France 123; Belgium-Luxembourg 55.
Unwrought	4,362	5,764	Malaysia 1,517; United Kingdom 1,102; People's Republic of China 1,000.
Semimanufactures	88	98	West Germany 77; United Kingdom 10.
Titanium:			
Ore and concentrate (ilmenite)	28,063	11,020	Australia 10,543.
Oxide	3,885	7,561	West Germany 3,671; Italy 1,154; United Kingdom 847; France 787.
Metal including alloys, all forms	189	264	United States 124; Yugoslavia 53.
Tungsten:			
Ore and concentrate	1,880	3,218	Peru 2,228; Burma 416; Republic of South Africa 277.
Metal including alloys, all forms	243	161	Belgium-Luxembourg 73; West Germany 55; United Kingdom 16.
Zinc:			
Ore and concentrate	295,722	309,138	Australia 169,533; Canada 58,167; Peru 30,271.
Oxides	3,022	3,644	United Kingdom 1,144; Belgium-Luxembourg 1,049; West Germany 776; France 485.
Metal including alloys:			
Scrap	4,031	4,476	West Germany 3,050; United Kingdom 398; Belgium-Luxembourg 319.
Dust (blue powder)	8,904	7,515	Belgium-Luxembourg 5,771; West Germany 1,453; United Kingdom 207.
Unwrought	26,450	28,777	West Germany 10,035; Belgium-Luxembourg 4,577; Zambia 4,155.
Semimanufactures	3,203	4,955	West Germany 2,801; Belgium-Luxembourg 1,896; France 182.

Table 3.—Netherlands: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Other:			
Ores and concentrates of nonferrous metals	611,226	207,988	Greece 116,986; Australia 26,220; United States 21,298.
Ash and residue containing nonferrous metals:			
Lead	3,368	10,203	Belgium-Luxembourg 9,154.
Zinc	14,192	13,480	West Germany 9,900; East Germany 2,207.
Other	35,223	71,080	Canada 54,402; West Germany 9,883.
Metals including alloys, all forms:			
Selenium	15	32	West Germany 14; United Kingdom 8; Japan 7.
Silicon, elemental	2,599	4,580	Republic of South Africa 2,276; France 823; Spain 648.
Alkali, alkaline-earth, rare-earth metals	NA	354	France 299; West Germany 54.
Base metals including alloys, all forms	2,310	2,955	Mozambique 904; Republic of South Africa 803; France 332.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc. thousand tons	561	297	West Germany 290.
Dust and powder of precious and semiprecious stones thousand carats	1,997	1,126	Ireland 804; Switzerland 113.
Grinding and polishing stones	2,310	2,478	West Germany 1,331; France 231; Austria 229.
Asbestos	35,852	49,466	Canada 39,720; Italy 4,394; U.S.S.R. 2,314.
Barite and witherite	118,829	121,874	Peru 87,693; West Germany 33,274.
Boron materials:			
Crude natural borates	384,768	334,059	United States 323,931.
Oxide and acid	2,379	2,875	Turkey 1,208; France 641; United States 516; Belgium-Luxembourg 330.
Cement thousand tons	2,056	2,601	West Germany 1,562; Belgium-Luxembourg 1,022.
Chalk	93,296	108,205	France 55,616; Belgium-Luxembourg 37,829; West Germany 12,996.
Clays and clay products:			
Crude clays:			
Bentonite[3] thousand tons	42	31	West Germany 14; United States 9; Greece 6.
Kaolin do	309	378	United Kingdom 174; West Germany 134.
Refractory do	26	31	West Germany 15; France 7; United Kingdom 4.
Products:			
Refractory (including nonclay brick) do	66	54	West Germany 29; United Kingdom 12; Austria 5.
Nonrefractory do	218	275	West Germany 142; Italy 49; Belgium-Luxembourg 45.
Cryolite and chiolite	641	1,092	Denmark 1,082.
Diamond, all types thousand carats	1,811	14,656	United Kingdom 2,422; Ireland 2,047; Burundi 1,835.
Diatomite and other infusorial earth	15,482	15,964	Denmark 8,643; West Germany 2,700; France 1,620.
Feldspar, fluorspar, leucite	59,935	81,477	Belgium-Luxembourg 8,168.
Fertilizer materials:			
Crude:			
Nitrogenous	12,900	25,092	All from Chile.
Phosphatic thousand tons	1,591	1,763	United States 591; Morocco 579; Togo 497.
Potassic salts do	9	7	All from West Germany.
Other do	57	56	West Germany 50; Belgium-Luxembourg 4; France 2.
Manufactured:

COMMODITY REVIEW

METALS

Aluminum.—A serious fire in the electrical switching station of Aluminium Delfzijl N.V. halted all smelter production for 3-1/2 months. Otherwise the industry was fully occupied, although a slackening of demand was noted in the second half of the year.

The two Dutch smelters, based on domestic natural gas, continued as important suppliers of both the domestic and export markets. The Aluminum Delfzijl smelter, located on the Ems estuary in the northeast, had a capacity of about 106,000 tons per year. The larger plant, Péchiney Nederland N.V.'s smelter at Vlissingen (or Flushing), had a capacity of 187,000 tons per year.

Alumina was imported from Surinam, Greece, and France. The Dutch Government had an agreement with the Surinam Government to develop new bauxite areas in western Surinam, but agreement on financing costs was still to be worked out.

Iron and Steel.—The Netherlands' major steel producer, Hoogovens IJmuiden B.V., finally decided to cut its expansion plans as a result of the continuing recession in the European steel industry. Plans to reach 11-million-ton capacity by 1985 were abandoned, and production was to be kept at the present level of about 5 million tons per year, well within the 7.3-million-ton capacity. Planned capital spending was also cut to $30 million per year, from an original level of $80 million to $120 million, and the work force was to be trimmed by some 2,500 out of 23,000 workers, of which 600 were to be production-line employees. The company expected a loss of $160 million to $200 million in 1977 but hoped to be in the black by 1980.

Hoogovens IJmuiden was owned by Estel N.V. Hoesch-Hoogovens, a Dutch-West German group headquartered at Nijmegen that also controlled the Hoesch steel plants in and around Dortmund, Federal Republic of Germany. Hoogovens' main plant on the coast at IJmuiden, west of Amsterdam, produced over 90% of the Netherlands' crude steel, with the remainder contributed almost entirely by NKF Staal B.V. at Alblasserdam, near Rotterdam, in which August Thyssen Hütte AG of the Federal Republic of Germany was a main shareholder. The third Dutch producer, N.V. Staalgietwerk SMDK at Utrecht, was liquidated during the year by the main shareholders, Hoogovens and Sambre et Meuse of France, because of lack of demand for its main product, castings for the shipbuilding industry.

Magnesium.—Billiton B.V. proceeded with its planned development of a 100,000-ton-per-year magnesium oxide plant at Veendam, scheduled to come onstream in 1981. Feed for the plant was to come from solution mining in the Provinces of Groningen and Drente, near Veendam; the latest estimate of plant requirements was about 600,000 tons of brines per year. The project was activated under a letter of intent from the two new partners, Billiton International Metals B.V. and Dutch Government-owned Northern Development Co.

Billiton's original partner in the solution mining venture, Norsk Hydro A/S of Oslo, Norway, withdrew and postponed plans to commence work on a 100,000-ton magnesium plant in Mongstad, Norway, which was to have taken part of the output of the Veendam solution mine.

NONMETALS

Cement.—One cement plant, with an annual kiln capacity of 2,640,000 tons, was operated at Maastricht by Eerste Nederlandsche Cement Industrie N.V. Two clinker-grinding plants were operated, one at IJmuiden by Cementfabriek IJmuiden B.V. and one at Rosenburg (Rotterdam) by Cement Fabriek Rosenburg B.V.

Salt.—All Dutch salt production came from a single company—Akzo Zout Chemie Nederland B.V., a subsidiary of the Akzo N.V. firm, which is international in extent and controls International Salt Co. of the United States. Production was centered at Hengelo and Delfzijl, both near the West German border. The salt was all produced by solution mining and vacuum evaporation, and much of it was exported. It was also converted into soda ash and electrolytic products, as well as several grades of salt.

MINERAL FUELS

Statements by high Government officials appeared to be harbingers of renewed interest in a stronger Dutch energy policy. The Prime Minister in June called for "an intensive energy conservation program" in view of the gradual exhaustion of the na-

Digitized by Google

tion's natural gas reserves. Not by coincidence, the Netherlands started to import natural gas from Norway at the same time. In May, the Minister of Economics emphasized the urgency of overcoming the anticipated gap between energy supply and demand and stressed the need to develop the nuclear alternative.

The Minister said that all estimates point to an oil shortage in the mid-1980's, only part of which could be compensated for by coal. Consequently, the EEC would run irresponsible strategic and political risks, as well as suffer substantial economic losses, if little or no nuclear energy were used. He declared that the Netherlands should make a decision to obtain an additional 3,000 megawatts from nuclear energy by the mid-1980's.

Energy balances for the Netherlands for 1975 and 1976 are given in table 5.

Table 5.—Netherlands: Supply and apparent consumption of fuels and power for 1975 and 1976

(Million tons of standard coal equivalent[1])

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Nuclear power
1975:					
Production	111.8	--	2.2	109.1	0.5
Imports	97.1	4.7	92.4	--	--
Exports	107.4	.9	47.3	[2]59.2	--
Apparent consumption	101.5	3.8	[3]47.3	49.9	.5
1976:

Coal.—Following closure of the last Dutch coal mine a few years ago, the Government was concerned to secure a supply of coal, especially coking coal, from abroad. In March, a contract was signed with Poland for the import of 750,000 tons annually of coking coal for a period of 10 years. This amount would be about 20% of total coking coal needs; over half will be used by Hoogovens. The total bill was expected to be about $400 million, of which about $40 million would be paid by shipments of steel from Hoogovens.

Establishment of a large coal terminal on the reclaimed Meuse flats was planned by the Rotterdam Port Authority; it could be used by deep-draft coal carriers from overseas.

Natural Gas.—The Netherlands, the world's largest natural gas exporter, started to import gas from Norway in 1977 at a rate of 2.5 billion cubic meters per year and also concluded a 20-year contract with Algeria in June for the delivery of a total of 80 billion cubic meters of liquefied natural gas (LNG) starting in 1984. Exploratory negotiations were also underway with Nigerian producers for the purchase of further supplies of LNG.

Behind these seemingly anomalous developments was the supply position in the Netherlands. During 1976, proven reserves had fallen from 1.85 billion cubic meters to 1.76 billion cubic meters, the first significant drop recorded, and by mid-1977 another small drop was reported. Large long-term export contracts had been concluded at favorable prices in the 1960's when future competition from nuclear energy was feared and before the energy crisis had become acute. By 1977, it was apparent that to cover long-term commitments and growing domestic requirements, about 500 billion cubic meters of additional reserves, or one-third more than present reserves, would be required. N.V. Nederlandse Gasunie, the sole distributor of natural gas in the Netherlands and owned by the Dutch Government (10%), DSM (40%), Shell Nederland N.V. (25%), and Esso Nederland B.V. (25%), therefore concluded that it was essential to obtain additional supplies from foreign sources while exploration went on for

Digitized by Google

large volumes of reserves. The price to be paid for this imported gas from both sources was unrevealed but was considerably higher than the export contract prices, and a prime objective of Gasunie was to renegotiate the latter. The Dutch Government was considering invoking a 1974 law that enabled it to step between Gasunie and the customers in the case of a price dispute, although foreign customers were expected to object.

It was expected that the Maasvlakte, a reclaimed area at the mouth of the Rhine River west of Rotterdam, would be chosen as the site for the storage and distribution plant to process the Algerian LNG; early in 1978 it was approved by the Dutch Cabinet, but further approval of the Rhine Mouth Authority was required. The site is adjacent to Gasunie's recently completed natural gas liquefaction and storage plant, which is used to bridge peak loads.

The low-cost Groningen field supplied about 95% of domestic production of natural gas in 1977, but offshore production, which started in 1975, reached about 5 billion cubic meters and was increasing rapidly. It was estimated that by 1980 offshore supplies would reach 10 billion cubic meters annually and would cover 20% of domestic demand. Blocks producing in 1977 were L10 and L11, operated by Placid International Oil Ltd; K13, operated by Pennzoil Nederland Co.; and L7, operated by Petroland B.V. Production licenses were granted for a number of small deposits in Blocks K8, K11, L13, and K15.

The major gas producer in the Netherlands was Nederlandse Aardolie Maatschappij B.V. (owned 50% by the Royal Dutch/Shell Group and 50% by Exxon Corp.), which operated the Groningen field and several smaller fields.

Petroleum.—Esso announced plans to convert a distillation unit to a 50,000-barrel-per-day viscosity breaker unit, to be completed in 1978. In this it joined British Petroleum Maatschappij Nederland N.V. (BP) and Shell, which earlier had announced plans to increase production of lighter products. All Dutch refineries were operating far below capacity, a fate shared by the majority of European refineries. The goal of a change in product mix to the lighter end of the barrel was motivated by a belief that demand would grow more strongly for those products, particularly motor gasoline, although annual fluctuations would be sizable. Future expenditures by Dutch refineries would, therefore, concentrate on improving safety, restricting pollution, and modernizing secondary capacity.

The Oil Stock Act of 1976 was passed by the Dutch Parliament and took effect on April 1, 1977. It compelled the oil industry and independent importers to keep 90-day stocks of crude oil and petroleum products.

The second stage of the crude oil storage farm under construction by five major oil companies (Shell, Esso, Chevron, BP, and Total) on the Maasvlakte near Rotterdam was completed, increasing the total number of storage tanks to 36 and the aggregate capacity to 4.3 million cubic meters. In view of the current level of crude oil demand, expansion to the projected full capacity of 100 tanks was not expected before 1985. Total Dutch distilling capacity remained at about 100 million tons in eight refineries, of which five were near Rotterdam, two near Amsterdam, and one at Vlissingen Oost (or East Flushing).

The decline in Dutch crude oil production since the peak of 2.4 million tons (about 17 million barrels) in 1965 was to be reversed gradually in the next 12 years through greater use of steam injection and expanding the number of wells by over 90, which together would require substantial investments. Petroleum production from the time of the discovery of the Schoonebeek field in 1943 to mid-1977 totaled 315 million barrels. Of this, the Schoonebeek field, in the Schoonebeek concession on the West German border, produced 179 million barrels; the remainder was almost entirely from several fields in the Rijswijk concession around The Hague: Ijsselmonde-Ridderkerk, Wassenaar-Meyendel, De Lier-Munster, Zoetermeer, and Pynacker.

The Mineral Industry of New Zealand

By Walter C. Woodmansee[1]

Natural gas and associated condensate continued to dominate New Zealand's mineral industry in 1977 and are expected to play an increasingly important role in the national energy program. Development continued onshore at the Kapuni gasfield and offshore at the Maui gasfield. The Maui gasfield was expected to be in production in 1978. Private oil and gas exploration was curtailed, pending a new Government petroleum policy, but new Government-sponsored exploration was initiated. The Government also conducted an exploration program for coal that was designed to delineate additional assured reserves. Major new coal mines that will mechanized and more efficient than older mines were under development during the year. These mines will provide fuel for power stations.

In New Zealand's nonfuel mining sectors, pit and quarry activity for sand and gravel, stone, clays, and other construction materials was extensive throughout the country and contributed a large share of New Zealand's total mining revenues for 1977. In the metals industries, production capacity was being expanded by New Zealand's two operating iron sand companies and at the Nation's sole steelmaking plant.

Late in the year, following a joint decision by the Minister of Mines and the Minister of Lands, the Mining Act of 1973 was amended so that holders of prospecting licenses were no longer permitted to automatically convert their licenses to mining licenses for national park areas. Exploration in New Zealand's national parks was nearly halted by the National Park Authority as a result of this provision.

Conflicts between mining and conservation interests intensified during 1977. The conservationists considered environmental requirements inadequate or inappropriate to achieve conservation goals; they wanted total restrictions on exploration and mining in certain areas. Government agencies proposed new or enlarged reserved areas, such as national parks and wilderness areas.

Legislation was passed that established a Ministry of Energy to formulate and implement a national energy policy. The Minister of Energy was granted authority to control most energy prices and to advise and assist private industry in mineral exploration and development, often with Government participation. Levies were established on natural gas ($0.45 per gigajoule), coal ($2 per ton), and lignite ($1.50 per ton). A proposal for a $3-per-barrel petroleum levy was dropped when the oil companies threatened to abandon exploration if the levy was imposed.

Imports of crude oil and refinery products provided about one-third of New Zealand's national energy requirements. Planned development of coal, natural gas, hydroelectric power, and geothermal power were expected to reduce petroleum imports between 20% and 25% of the Nation's total energy requirements by 1990.

PRODUCTION

Value of 1977 production in the mining sector, including coal but not natural gas and condensate, was estimated at $139.7 million.[2] This production accounted for only 0.9% of New Zealand's gross national product, $15,419 million as estimated by the

Digitized by Google

New Zealand Institute of Economic Research. The principal mineral products (in thousand dollars) were sand and gravel ($53,302); coal ($46,164); iron sand concentrate ($20,853); limestone for agriculture, roads, cement, and other industries ($12,375); clays for brick, tile, and pottery ($1,999); gold ($1,156); serpentine ($946); silica ($688); salt ($650); and dolomite ($451).

There were few significant production shifts during the year. However, significant increases were made in the production of sand and gravel — the principal mine product in terms of output value — and in the production of iron sands, gold, silver, salt, bentonite, and kaolin. A small amount of new production was recorded for copper and zinc ores, but sulfur production ceased. Production losses were noted for coal, smelter aluminum, fire clay, pumice, and dimension stone.

(Metric tons unless otherwise specified)

Commodity		1975	1976	1977[p]
MINERAL FUELS AND RELATED MATERIALS —Continued				
Petroleum —Continued				
Refinery products:				
Gasoline	do	10,402	12,052	10,846
Distillate fuel oil	do	4,219	5,168	4,894
Residual fuel oil	do	6,722	7,795	7,093
Other	do	505	674	780
Refinery fuel and losses	do	1,568	1,704	939
Total	do	23,416	27,393	24,552

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.
[1]Average 57% iron.
[2]Includes crushed rock for building aggregate, roads, and ballast.
[3]Excludes carbon dioxide component of natural gas, which is reported separately.
[4]Includes crude oil and field condensate.

TRADE

According to the Department of Statistics at Wellington, principal mineral exports during fiscal year 1977 (year ending June 30, 1977) were unwrought aluminum ($116.4 million), iron and steel scrap and iron sand concentrates ($18.1 million), and iron and steel semimanufactures ($13.3 million).

Crude petroleum, partly refined petroleum, and petroleum refinery products dominated New Zealand's mineral imports; they were valued at $528.6 million in fiscal year 1977, or 15% of the total import value. Most of the crude oil was imported from Iran, but Kuwait and Saudi Arabia were also sources of significant supplies. Imports of iron and steel, mainly semimanufactures, totaled $251.5 million. Other significant mineral imports included phosphate rock from Nauru, Australia, and the Gilbert and Ellice Islands, and sulfur from the United States and Canada.

COMMODITY REVIEW

METALS

Aluminum.—The New Zealand Government and New Zealand Aluminum Smelters Ltd. (NZAS) negotiated new rates for electric power supplied to the NZAS smelter at Bluff. The Government contended that existing rates were too low relative to charges to other users of the power grid and decided to extract an oil-equivalent charge. Late in the year, a 30-year agreement was reached that provided for a 4.5 fold rate increase, effective January 1, 1978. This agreement also provided for price escalation every quarter year, based on aluminum prices and the cost of producing electricity, and called for review of the price formula at 3-year intervals.

Gold.—Output was substantially above that of 1976. Kanieri Gold Dredging Ltd., a subsidiary of Amoil New Zealand Ltd. and New Zealand's only gold-dredging operation, produced 6,105 troy ounces of gold from 2,809,845 cubic meters of gravel in the Taramakau River on the west coast of South Island. Operations were centered at Kumaru, between Greymouth and Hokatike. Kanieri experienced operating problems that caused it to consider terminating its operations. Replacements for broken-down equipment were difficult to obtain, labor was in short supply, and operating costs were rising.

Several other companies prospected and explored for gold. Ryan Mining Ltd. produced minor quantities of gold along the Shotover River in the Queenstown area of South Island, following a 3-year evaluation effort. Mineral Resources (New Zealand) Ltd. continued investigation at the former Martha mine at Waihi, North Island. The company worked old stockpiles and mine dumps at Union Hill and tested bulk samples at a recently renovated pilot plant. Blackwater Gold Ltd. and Carpentaria Exploration Co. Pty. Ltd. (Australia) tested ore extensions at a property formerly owned by Blackwater Mines. Amoco Minerals New Zealand Ltd. applied for a prospecting license for the Monowai gold area. There was other gold prospecting in central Otago, but it was small-scale and seasonal.

Iron Sands.—A substantial increase in iron sands output—to nearly 3 million tons—resulted from expansion of production capacity by the country's two producing companies. These companies were New Zealand Steel Mining Ltd., a wholly-owned subsidiary of New Zealand Steel Ltd., and Waipipi Iron Sands Ltd.

New Zealand Steel Mining's $16 million expansion project at Tarahoa was near completion at yearend. A movable concentrator, a second stockpiling facility, new service buildings, a new slurry pipeline, and a new berthing buoy were installed.

Waipipi Iron Sands' new throughput capacity at Waverley of 2,400 to 2,700 tons of crude ore per hour makes possible an annual output of 1.8 million tons of concentrate. The company exported 1,332,000 tons of dry concentrate in 1977, mostly to Japan. Ore reserves as of January 1, 1977, based on an exploratory drilling on a 250-meter grid, totaled 29,446,000 tons of dry concentrate. During the year, Utah International Inc. acquired Marcona Corp.'s 75% interest in Waipipi Iron Sands Ltd.

Steel.—New Zealand Steel Ltd. started an expansion program that is expected to double its concentrate throughput capacity to 250,000 tons per year in 1978 and provide further increases to 750,000 tons per year within 10 years. A new multi-hearth preheating furnace for iron sand concentrate is expected to result in more efficient use of energy and make faster reduction to sponge iron possible, thereby increasing capacity by 30%. Plans also called for a cold-rolling sheet mill and coat line for plain and galvanized sheet. Long-term plans included a new melt shop, continuous-slab casting, and more direct-reduction kilns.

Other Metals.—The Department of Scientific and Industrial Research was investigating black, heavy-metal beach-sand deposits on the west coast of South Island. These sands contain ilmenite, monazite, zircon, and gold.

Small-scale renewed production of copper and zinc ores resulted from a number of prospecting ventures for base metals. Amoco Minerals New Zealand Ltd. applied for prospecting licenses on Coromandel Peninsula and used airborne magnetometry to search for base metals. Otter Minerals Exploration Ltd., in association with Gold Mines of New Zealand Ltd., continued exploration in Nelson Province and was drilling on D'Urville Island. Gold mines of New Zealand Ltd., a partnership of Australian Anglo-American Corp. Ltd., and Amoil New Zealand was also active in the Raukumara, East Cape, and Kaikoura regions.

NONMETALS

Asbestos.—Asarco Exploration Co. of Canada Ltd. terminated its participation with Kennecott Explorations of Australia Ltd. and Lione and Marble Ltd., New Zealand, in exploration for chrysotile at the Pyke River prospect in northwest Otago, South Island. Tests indicated there are two ore bodies of favorable fiber quality, although further exploration was necessary.

Phosphates.—Cruises in 1976 and 1977 by the New Zealand Oceanographic Institute identified a seabed phosphorite deposit containing 18% to 24% P_2O_5 in nodules and coarse-grained sand. The deposit lies in an east-west belt 16 kilometers wide, along the crest of Chatham Rise, which extends 1,300 kilometers east of Banks Peninsula, South Island. The seabed is 400 to 500 meters deep in the deposit area.

Sulfur.—Fletcher Mining Co. Ltd. attempted to recover sulfur at the 6-million-ton Rotokawa deposit in the Taupo area of North Island. The Frasch process was employed, using hot water from geothermal wells as a heat source, but the attempt was unsuccessful. The company then planned open pit mining to extract molten sulfur using hot water under pressure. Plans were to use a solvent for subsequent sulfur recovery.

Other Nonmetals.—Land Sea Minerals Ltd. was evaluating offshore sand and gravel deposits near Whangarei, North Island. Seasonal and full-time quarrying for construction materials was extensive, particularly in and near cities. Several new rock quarries were opened near Nelson, South Island.

MINERAL FUELS

Coal.—According to the annual report of the Minister of Mines, total coal production was down slightly from that of 1976. Production at State mines was 22% lower than the previous year's production, as a result of reduced deliveries to power stations and the cement industry. Of New Zealand's 70 operating mines, 37 were open pit mines and 33 were underground. The open pit mines accounted for 73% of total output.

The objective of a 5-year Department of Mines coal exploration program was to reclassify inferrred reserves in measured and indicated reserves categories. Exploration started in the eastern part of the Southland lignite field in Mataura Valley, South Island, and was planned to continue in the Waikato area of North Island and the west coast deposits of South Island.

The Department continued development of three major State mines under its $75 million program to increase coal production by 2 million tons per year. The mines are in the Huntly area of North Island and will provide fuel for the Huntly power station and for industrial and residential use. These mines will employ continuous miners and both electric- and hydraulic-powered shuttle cars. Recovery from deep coal seams had been only 40%, but the development program is expected to increase recovery to 70% using improved technology.

The proposed Coal Mines Bill would provide for more Government control of private coal operations through the Minister of Energy, and for Government grant and loan assistance to private exploration and mining proposals. Applicants would be required to submit plans for development programs, including plans for environmental protection and health and safety compliance, and levies would be collected to finance coal research and miners' retirement benefits.

Table 4.—New Zealand: Coal Statistics

(Metric tons unless otherwise specified)

Year	Production		Employment (number of workers)	Exports	Imports
	Open pit	Underground			
1975	1,695,459	716,934	1,600	1,285	4,486
1976	1,764,113	722,791	1,528	10,394	1,345
1977	1,734,297	634,612	1,650	10,605	1,341

Source: State Coal Mine. Mines Statement for Year Ended Dec. 31, 1977.

Digitized by Google

Natural Gas.—Production from the Kapuni gasfield was nearly 60% higher than that of 1976, due to newly developed capacity and stepped-up deliveries to the New Plymouth and Stratford power stations. Late in the year, a recalculation of Kapuni reserves resulted in a threefold increase over original estimates.

The first stage of a $1 billion development program conducted by Shell-BP-Todd Oil Services Ltd., operating contractor for the Government, continued at the offshore Maui gasfield, where reserves were estimated at 5.3 trillion cubic feet. Construction of the 12-well Maui-A production platform was delayed by adverse weather and difficult sea conditions. Early in the year, 34-kilometer gas and condensate pipelines to shore facilities were expected in early 1978, and the gas treatment plant at Oaonui was also near completion. A second stage of the development program is planned that includes a Maui-B production platform with associated pipelines and is scheduled for 1983.

The Minister of Energy proposed a new State company that would combine the Government's Natural Gas Corp., which is responsible for natural gas distribution and sales, and the Government's Offshore Mining Co. Ltd. The new company would be responsible for Government participation in onshore and offshore exploration and offshore development.

Petroleum.—Production of condensate at the Kapuni natural gasfield by Shell-BP-Todd, the operating contractor, increased about 43% over the 1977 rate.

There was relatively little exploration activity, pending new Government policy on a proposed petroleum production tax. Government-sponsored exploration began in July; six prospecting licenses were granted in the name of the Minister of Mines. Onshore, two wells were drilled near Aritika, on the west coast of South Island, under a $10 million Government program. The first well was dry and abandoned at 1,500 meters; the second was in progress at yearend.

Offshore, the Seahunt Group drilled two wells from Penrod-74, a semisubmersible rig, in the Great South Basin off the southern coast of South Island. Ownership of the Seahunt Group is shared by the Hunt International Petroleum Co. of New Zealand Ltd. and Phillips Petroleum Ltd. (60% combined ownership) and the New Zealand Government (40%). One well was unsuccessful, but the other encountered traces of natural gas and condensate.

At yearend, 23 onshore and offshore petroleum prospecting licenses were in effect. Less total acreage was licensed for prospecting at yearend 1977 than was licensed at yearend 1976.

The Mineral Industry of Nigeria

By Janice L. W. Jolly[1]

Petroleum revenue formed about 31% of Nigeria's 1977 gross domestic product (GDP) estimated at $31 billion.[2] Nigeria's tin production provided about 1.5% of the world total. Nigeria also produced about 3% of the world's supply of columbium. Cement production was valued at about $40 billion and was being expanded. Nigeria's only operating petroleum refinery at Port Harcourt was furnishing 35% of the country's needs. Frequent oil product scarcities were becoming a regular feature of the Nigerian economy, but the Federal Military Government was hoping to combat this problem with construction of two new petroleum refineries, an extensive product pipeline system, and 18 new storage depots by the early 1980's. To spur renewed interest in lagging petroleum exploration, new petroleum investment incentives were announced in April. Nigeria continued the indigenization of most of the mineral industry. All private industry was subject to the 1977 Nigerian Enterprise Promotion Decree that provided for all ventures to be at least 40% Nigerian.

At yearend, Nigeria was considering limiting oil production and lowering crude oil prices, with a consequent 20% to 40% decrease in revenues expected for 1978. Factors contributing to this decision included the successful moves by industrialized countries in counteracting high oil prices and slower world economic growth and the consequent decline in demand. Many countries had increased petroleum storage capacities and had installed systems using heavy oil, rather than light oil such as that produced by Nigeria. Also, other Organization of Petroleum Exporting Countries (OPEC) members such as Algeria and Libya were selling light crude at lower prices, making Nigeria's product less competitive. Nigerian crude was becoming increasingly more difficult to sell at the high prices asked. The third national development plan, based on revenues from a production of 3 million barrels of crude oil per day, was to be drastically revised.

Electrical shortages were increasingly becoming a problem, hampering industrial growth. The demand for electricity had grown about 25% per year since the first hydroelectric dam became operational at Kainji in 1972. To keep pace with this rapid growth of demand, the National Electric Power Authority (NEPA) was planning new powerplants. New thermal stations were being constructed at Sapele (720 megawatts), and Port Harcourt (720 megawatts), while hydroelectric dams were being built at Shiroro (600 megawatts) and Jebba (545 megawatts). Extensions to the Kainji, Delta, and Afam power stations were also underway. Total installed generating capacity is to be 1,170 megawatts by 1978.[3] Electricity-generating capacity was 46% hydroelectric, 50% gas turbine, and 4% diesel. Energy sales (in megawatts) were divided among industrial consumers 40.5%, residential consumers 31.5%, and commercial consumers 22%. Nigeria also purchases 10 megawatts over a 132-kilovolt line to Niamey.

The Nigerian Government was planning to build a new capital city in the central part of the country. The Federal Capital Development Authority (FCDA) requested the U.S. Geological Survey (USGS) to make a geological and environmental assessment. Geologic, resource, and land-classification maps were being prepared to provide a basis for more detailed engineering studies and final selection of construction sites by the FCDA. The USGS was to coordinate its

Digitized by Google

work with the Nigerian Geological Survey and other Nigerian agencies. The USGS maps were to be prepared at a scale of 1:100,000.

PRODUCTION AND TRADE

Crude petroleum production was 765.5 million barrels in 1977, 756.1 million barrels in 1976, and 673.7 million barrels in 1972. Oil revenues had reached a level in 1977 almost nine times that of 1972. Based on an average of $12.90 per barrel for the first quarter and $13.15 for the last three quarters of 1977, an estimated $9.7 billion in oil revenues was earned for the year. Government oil revenues for 1976 were reported as $8.6 billion.[4] This compared with 1.2 billion for 1972. Nigeria exported a total of 740.2 million barrels in 1977, for an average of 2,028,077 barrels per day, representing an increase of 3% over exports in 1976. The United States took 56.4% of Nigeria's total exports during the first 2 months of 1977, and Nigerian crude oil accounted for 19% of U.S. petroleum imports.

Negotiations with U.S. buyers for the sale of liquefied natural gas (LNG), which was to be available by 1980 from the planned new liquefaction plant at Bonny were reaching an advanced stage. Sweden had also expressed an interest in importing Nigerian gas, possibly in exchange for building some of the LNG carriers required.

Tin production showed a further decline, continuing the trend of the past several years. The performance of the tin industry in the first 10 months indicated some improvement, but the final record for 1977 showed a decline from 1976 production. Production averaged 408 tons of tin concentrate for the first 4 months of 1977 but had decreased to an average of 386 tons per month by yearend.

Domestic cement production, which was about 1.3 million tons in 1976, increased to 1.4 million tons in 1977. Although total domestic production was to increase by a further 2 million tons in 1978, current consumption of cement was put at 6 million tons.

COMMODITY REVIEW

METALS

Columbium and Tantalum.—Columbite concentrate, recovered in conjunction with tin mining, totaled 861 tons, compared with 708 tons in 1976. Major producers were Bisichi-Jantar Nigeria Ltd. (406 tons), Amalgamated Tin Mines of Nigeria Ltd. (ATMN) (225 tons), and Vectis Tin Mines Ltd. (150 tons).[5] Gold & Base Metal Mines of Nigeria Ltd. produced 8 tons of columbite concentrate in 1977, compared with 9 tons in 1976.[6]

Columbite was separated from other minerals and concentrated by a complex system of size classifiers and magnetic, electrostatic, and airfloat separators at the ATMN concentrating mill located in Jos. The 100-pound bags contained approximately 99% columbite. The price for columbite concentrates varied, with higher tantalum content bringing the higher price. The columbite-to-tantalum content varied between 8:1 and 12:1.

Tantalite was a minor component in the columbite-tantalite concentrates from the alluvial deposits. Tantalum was also produced from the tin slag from the Makeri smelter and was sold abroad for further processing. Tantalum recovered from tin slag was estimated at 50,000 pounds annually. In 1977, approximately 156,000 pounds of tantalum was derived from the columbite concentrate. According to industry sources, total tantalum reserves were estimated at 600 tons of contained recoverable Ta_2O_5 (tantalum pentoxide) in current working sources, or about a 9-year supply. This included about 500 tons of reserves in tin ores.[7]

Iron and Steel.—Steel consumption in Nigeria was expected to reach 3.5 million tons in 1980, and Nigeria was making plans to expand local production. The National Steel Development Authority (NSDA) was planning several direct-reduction steel mills, including mills at Port Harcourt and Warri, and an integrated blast-furnace steelworks at Ajaokuta.

A contract for building the direct-reduction plant at Warri in Bendel State, to be located between Ovian and Aladja, was signed in late 1977 with a six-member West German-Austrian consortium, headed by the West German group Gutehoffnungshütte Sterkrade AG. The plant is to take 3 years to complete and will have an annual capacity of 1 million tons of crude steel. Valued at $700 million, the contract is to include two Midrex direct-reduction furnaces. The iron ore supply for the steel plant is to first be imported from Liberia, the United Kingdom, Sweden, and the Federal Republic of Germany, but would later come from Guinea where Nigeria has a 13.5% share in the Mifergui iron ore project.

At yearend, progress on the Ajaokuta blast furnace project was picking up momentum with assistance from the U.S.S.R. and France. France's Soc. Française d'Etude et d'Installations Siderurgiques (SOFRESID) was commissioned to act as consultant for the planned 2.6-million-ton-per-year steelworks. Development of iron ore at Itakpe and coal at Lafia was also part of the plans. France's Soc. Française d'Etudes Minières (SOFREMINES) was contracted for the iron ore mine engineering.

There were five Japanese joint venture

Digitized by Google

steel projects in Nigeria. Galvanizing Industries Ltd., operated by Yodogawa Steel Works, Ltd. and C. Itoh & Co., Ltd. had four galvanizing lines, while Pioneer Metal Products, operated by Nihon Koken Kogyo Co., Ltd., Marubeni Corp., and Hill, had three galvanizing lines. Nigerian Wire Industries was operated by Mitsui & Co., Ltd., and Continental Iron and Steel, which produced 360,000 tons per year of steel bars, was run by Kyoei Steel, Ltd., and Nissho-Iwai Co., Ltd. The fifth company was Standard Industrial Development, which produced small-diameter pipes, operated by Kobe Steel, Ltd., of Mitsubishi Corp. Japanese involvement was increasing, with a new firm, known as Rolled Steel Products Ltd., being set up by Kawasho Corp. (10%), Kenya's Steel Africa Ltd. (50%), and Nigerian concerns (40%). The plant, to be built at Ibadan, is to start up in 1979 and have an initial capacity of 8,000 tons per year of galvanized sheet.

Tin.—In 1977, the principal tin-producing companies on the Jos Plateau were ATMN, Bisichi-Jantar (Bisichi Tin Co. (Nigeria) Ltd. 50% and Jantar Nigeria Ltd. 50%), Exlands Nigeria Ltd., Gold & Base Metal Mines, Kaduna Syndicate, United Tin Areas of Nigeria Ltd., Vectis, Tin and Associated Minerals Ltd. (Kennecott Copper Corp. 49%), and the Government organization Nigerian Mining Corp. (NMC).

Tin concentrate production in 1977 was estimated to be about 4,630 tons of 72.5% tin, down from the 5,050 tons produced in 1976. Production at the Makeri smelter was 3,315 tons of tin metal for 1977, compared with 3,667 tons for 1976. Some improvement in mine production had been evidenced the final quarter of 1976 and early 1977, coinciding with the increase in tin prices on the world market. In general, however, tin production continued to show a decline throughout most of 1977 owing to such factors as irregularities in fuel supplies for earth-moving equipment, mechanical problems, shortages of equipment, and pit wall failure in one of the mining areas. A stagnation in mining investment was also considered to be a major factor in the declining tin production, resulting in a dropoff in exploration as well as production activity, particularly in the deep-seated alluvial ground. A lack of adequately trained staff was also a problem. Tin mining companies were attempting to solve labor-loss problems by improving working conditions. ATMN was also to sell 6% to 10% of its equity to company employees, an action aimed at checking the drift of its workers to the construction industry where wages had risen sharply in recent years.

During the year, the valuation of shares in foreign-owned tin mining companies by the Capital Issues Commission was completed. This set the stage for transfer of majority interests in conformity with the Nigerian Enterprise Promotion Decree enacted in 1977. In 1977, Amalgamated Tin Mines of Nigeria (Holdings) Ltd. of the United Kingdom negotiated the sale of another 20% of its equity in its Nigerian subsidiary ATMN to comply with the new legislation. In August 1976, the British company sold 40% of its shares to NMC, but the 1977 indigenization program requires a minimum Nigerian equity holding of 60% by December 31, 1978. The sale of the additional shares to NMC is to be completed by April 1978, at which time ATMN would become a subsidiary of NMC. By yearend 1977, NMC had also acquired a 21% interest in Makeri Smelting Co. Ltd., a subsidiary of Amalgamated Metal Corp. Ltd. of London, making a total of 40% equity interest held by Nigerians in compliance with Schedule III of the Indigenization Decree. One other major area of investment by NMC was the joint venture with Gold & Base Metal Mines in the Ririwai (Liruen) tin-zinc lode project, in which underground development continued during the year. The revised cost of the project had escalated to $36.5 million.

In 1977, tin reserves were estimated at 60,000 tons (metal content) in the alluvial gravels, according to local sources. Official estimates in past years had put total tin reserves at 280,000 tons (metal content), which constituted about 2.7% of world reserves (including 135,000 tons measured and indicated and 144,200 tons inferred). Undiscovered resources were estimated to be around 590,000 tons.

Bedrock depth in the ATMN active pit in 1977 was 80 feet, but it was 100 feet in the new pit under development. The ore zone, usually occurring near the base of the sedimentary section, was generally about 4 feet wide and contained about 0.75 pound of tin per cubic yard. The tin- and columbite-bearing deposits occur as three types on the Jos Plateau: Alluvial deposits—including present-day deposits along streambeds, laterite and alluvial deposits of the Fluviovolcanic series (a group of sediments and lavas of mid-Tertiary age) that occur beneath the Newer Basalts of late Tertiary

Digitized by Google

age, and deep Fluvio-volcanic alluvial deposits; eluvial deposits, which are shallow and generally low grade; and primary vein deposits.

The following tabulation indicates tin production for the first 10 months of 1976 and 1977 as recorded by the major producing companies, in tons of metal content:

Company	January through October	
	1976	1977
Amalgamated Tin Mines of Nigeria Ltd	1,976	1,805
Bisichi-Jantar Nigeria Ltd	346	330
Ex-lands Nigeria Ltd	428	769
Gold & Base Metal Mines of Nigeria Ltd.	280	270
Kaduna Syndicate	200	95
United Tin Areas of Nigeria Ltd	27	21
Vectis Tin Mines Ltd	22	3
Total	3,279	3,293

NONMETALS

Cement.—In 1977, new cement plants were under construction at Shagamu, Yandev, and Ashaka, and existing plants at Enugu, Ewekoro, Auchi, Calabar, and Sokoto were being expanded. By the end of 1978, Nigeria is to have eight producing cement plants with the following annual capacities: Calabar Cement Co. Ltd. at Calabar, 400,000 tons; Cement Co. of Northern Nigeria at Sokoto, 100,000 tons; Upkilla Cement Co. Ltd. at Auchi, 450,000 tons; Nigerian Cement Co. Ltd. at Enugu, 720,000 tons; West African Portland Cement Co. (WAPCC) at Ewekoro, 705,000 tons, and at Shagamu, 720,000 tons; Ashaka Cement Co. Ltd. at Kano, 300,000 tons; and Benue Cement Co. Ltd. at Yandev, 100,000 tons.

The Shagamu cement plant, a partly owned subsidiary of WAPCC in Ogun State, was built at a cost of $155 million. Two of the six production units were in operation at yearend 1977. When all units are functioning, the plant is to have an annual output of about 1.4 million tons. WAPCC was established in 1959 with Associated Portland Cement Manufacturers Ltd. (APCM) of the United Kingdom as the majority shareholder; in 1977, it held 40% of WAPCC. APCM was exporting bulk cement to Nigeria under a 3-year contract with Nigerian National Supply Co. that began in 1977. About 1 million tons of cement was to be shipped to Lagos during 1978 by APCM.

The following tabulation indicates recent trends in the domestic production, imports, and consumption of cement in tons from 1973 to 1977:[8]

Year	Production	Imports	Consumption
1973	1,241,674	868,766	2,110,440
1974	1,245,739	1,953,960	3,199,699
1975	1,383,504	1,765,982	3,149,486
1976	1,273,504	1,988,219	3,261,723
1977	1,439,793	4,747,388	6,187,181

Source: Standard Chartered Review (London). Nigeria. June 1978, p.39.

Clays.—Kaolin production was estimated at 1,120 tons in 1977. Exploitable clay deposits were discovered in Kaduna and Bendel States by Nigerian Mining Corp. A brick factory was being planned around the deposit in Kaduna.[9]

Salt.—At yearend, the Federal Military Government ordered a massive importation of salt to combat the acute shortage experienced throughout the country. The price for salt had increased about 500%[10] to about $31 per 50-kilogram bag. Licensing for imported salt had been restricted in an effort to protect local salt producers, but this was to be changed to allow 75,000 tons of salt to be imported.

Stone.—*Crushed Rock.*—Cement Roadstone Holdings Ltd., of Ireland, expanded its crushed rock operation in Nigeria with the startup of a 180-ton-per-hour, Finnish-made Lokomo crushing plant and a more modern quarrying operation. The crushing plant processes the hard abrasive granite for use as road metal.[11]

MINERAL FUELS

Coal.-Poland was providing assistance in setting up a Polish-supplied mining laboratory in Nigeria that was to be operational in 1978. Initial output from the Polish longwall mining operations at the Okagbe (Okabba) and Onyeama (Anyeama) coal mines started at yearend. The 18-month Polish contract with National Coal Corp. (NCC) had included mechanization of the mines as well as installation of a coal-crushing and -washing plant that was capable of handling 2,000 tons per day. The Polish company Katowic Arebowa was assisting with underground operations.

Although equipment had already been purchased, a shortage of skilled technical staff was expected to hinder the planned mechanization of the Nigerian coal industry. In addition to local efforts, NCC was

Digitized by Google

attempting to fill this need through active overseas recruitment. Qualified Nigerians were reluctant to accept the jobs because of the low salary ratings scheduled by the Government.[12]

Coal reserves were estimated to be about 144 million tons near Enugu, including about 45 million tons at Okabba in Kwara State, 65 million tons at Ogboyoga, and 34 million tons at Orukpa. Lignite reserves of 71 million tons were indicated at Benin. Because of the Enugu coal's higher moisture and ash content (5% to 20%), it was considered a poorer quality fuel. The Enugu coals were being used by Nigerian cement and thermal energy plants.

A $3.3 million plant to remove free shale from coal, as well as to wash and grade the coal, was completed in 1977. NCC was also to build a $47 million plant for large-scale carbonization of the Enugu coal. Products were to include coke char, electrode pitch binder, tar, and creosote.

Coal reserves at Lafia were in excess of 100 million tons, but the coal had a relatively high sulfur and ash content and was to require considerable dressing before coking. The NSDA, with Soviet assistance, was investigating the Lafia coals. The complex rock structure was expected to prove difficult for mining. The Lafia mine was expected to begin producing 50,000 tons per year of coking quality coal by 1979 which would be utilized by the local steel industry.

Natural Gas.—Gas production totaled about 18,000 million cubic meters in 1977; most of this was flared. Gas reserves were estimated to be 1,245 billion cubic meters, or 1.9% of the world total.

Decisions were being firmed up on the building of an LNG plant at Bonny, the main oil export terminal. Shell Oil Co. and British Petroleum Co. Ltd. (BP) were to each have 10% interest in the project; Phillips Petroleum Co., A.S.p.A., and Essence et Lubrificants de France (ELF) were to each have 5%; and Nigerian National Petroleum Corp. was to have the remainder. The project cost was estimated at nearly $5 million. Constructing one large plant at Bonny instead of the two smaller ones planned earlier was expected to result in considerable savings. Shell-BP had signed an agreement with the Government in 1976 for the construction of an 800-million-cubic-foot-per-day plant. Phillips-Agip-ELF were also working on the feasibility study for a second plant to be located at Escravos. Plans for both of these plants were apparently discontinued in favor of the one larger plant at Bonny.

The Bonny LNG plant was to have a rated capacity of 1,600 million cubic feet per day, which amounts to 16,500 million cubic meters per year or roughly 90% of Nigeria's current associated gas production. Initial gas input to the plant was to be 300 million to 600 million cubic feet per day. The gas-gathering network needed to service the plant was to be the responsibility of the Government, which would take between 85% and 100% participation in this part of the project. In addition, the State planned to take a 50% holding in shipping facilities.[13]

The firming up of plans for the LNG plant was also a significant move forward for the planned petrochemical complex at Port Harcourt that has been under discussion for some years and was to draw its feedstock from the LNG project. Bids for the managing contractorship of this project, which was to be based on a 250,000-ton-per-year ethylene plant, were under evaluation. Contenders included Bechtel Corp., Foster Wheeler Corp., and Ralph M. Parsons Co. of the United States.

Petroleum.—*Production.*—Nigeria was producing an average of 2.2 million barrels of crude oil per day in the first 6 months of 1977, but by December, this had decreased to 1.9 million barrels per day. Exports had also declined to about 1.9 million barrels per day by yearend. By March, storage tanks were completely full, and the oilfields feeding the storage tanks were forced to shut down intermittently throughout the rest of the year. Production shutdowns, caused in part by Nigerian overpricing, were largely negating any cashflow benefits that may have been derived from the newly announced incentives.

Nigeria was a price hawk among the light, low-sulfur crude oil producers. Nigerian crude oil was about 70 cents higher than Libyan oil in 1977. Most of the price increase went into Government coffers; the profit margins of the companies did not improve. By yearend, however, Africa's three leading oil producers were all reducing the quality premium differentials on their overpriced crude by 20 to 30 cents per barrel. Because their oils were high quality, low sulfur, and close to European and U.S. markets, Algeria, Libya, and Nigeria had charged premiums of up to $2 per barrel. Nigeria's Bonny Light crude was officially priced at $14.63 per barrel. The oil industry

Digitized by Google

considered Nigeria's crude to be overpriced in light of a softer market.

A decree issued April 29 dissolved the Federal Ministry of Petroleum Resources and Nigerian National Oil Co. (NNOC). A new organization called Nigerian National Petroleum Corp. (NNPC) was established to replace them. The Government, through NNPC, had a 55% share in each of the major producers in Nigeria, with NNPC acting in the dual role of a State company and the Government regulating body for the industry. Although the Government adopted its 55% share in the operations and production of most companies in 1974, compensation arrangements are not expected to be completed until 1978.

Texaco Overseas (Nigeria) Petroleum Co. and Chevron Oil Co. received about $71.6 million from NNPC for a 55% share in oil exploration and production operations of the two companies in Nigeria. Texaco Inc. was to continue as operator for the three producing fields and several prospecting leases. The settlement was backdated to May 1, 1975. Texaco and Chevron each held 22.5% of the new company.

Nigeria's major crude oil producers are shown in Table 4.

Table 4.—Nigeria: Major crude oil producers in 1977

Company	Ownership	Production (barrels per day)
Shell-BP Petroleum Development Co. of Nigeria Ltd.	Royal Dutch/Shell Group (Netherlands) 22.5%, British Petroleum Co. Ltd. (United Kingdom) 22.5%, Nigerian National Petroleum Corp. (NNPC) 55%.	1,200,000
Elf Nigeria	Elf Aquitaine (France) 45% and NNPC 55%	79,446
Gulf Oil Co. (Nigeria) Ltd	Gulf Oil Corp. (United States) 45% and NNPC 55%	290,623
Mobil Producing Nigeria	Mobil Oil Corp. (United States) 45% and NNPC 55%	223,394
Nigerian AGIP Oil Co. Ltd	Agip S.p.A. (Italy) 22.5%, Phillips Oil Co. (Nigeria) Ltd. 22.5%, NNPC 55%.	213,347
Ashland Oil (Nigeria) Co	NNPC 100%	6,368
Pan Ocean (Nigeria) Oil Corp	Marathon Oil Co. (United States) 100%	9,819
Texaco Overseas (Nigeria) Petroleum Co	Texaco Nigeria Ltd. 22.5%, Chevron Oil Co. (United States) 22.5%, NNPC 55%.	53,144

NNPC's long-term crude oil sales contracts with foreign producers expired at yearend. Draft sales agreements with NNPC were expected to be in operation throughout much of 1978.

The Federal Military Government was to purchase a new tanker that would join the 270,000-ton *Oleibiri* bought in 1976. The new tanker was to be about 100,000 tons and would be used for the Nigeria-to-United States route.

According to NNPC, through efficient production practices and effective conservation controls, Nigeria's petroleum production could exceed the current calculated lifespan of 25 years. Unofficial estimates put the country's oil reserves at more than 20 billion barrels, which accounted for 3% of world reserves.[14]

Exploration.—To reverse the 3-year trend of low exploration activity, an investment incentives package was announced April 1, effective immediately. The new investment law contained changes in exploration cost deductions, petroleum profits tax and royalty rates, annual capital allowances, and company investment tax credits.

To encourage early definition of petroleum discoveries, all exploration drilling costs, as well as costs for the first two appraisal wells, successful or not, were allowed to be written off as an expense against tax. Previously, all dry well costs were expensible, but cost items for successful wells were regarded as capital.

To provide some relief for new investors from the petroleum tax requirements, the profits tax rate was to be temporarily reduced to the lowest level operating for any OPEC member. The reduced tax rate (65.75%) was to apply only for the period of amortization of preproduction costs, after which the company would be required to pay the normal 85% profits tax. This incentive was designed to attract new investors and would not apply to already established producers. Companies such as Japan Petroleum Exploration Co., Ltd. which had five offshore prospecting concessions and has drilled few successful wells, would be eligible.

The royalty rate was to be graduated, taking into account the environment of the operations. For onshore production, the roy-

Digitized by Google

alty would be 20%; for offshore production in areas up to and including 100 meters deep, the royalty would be 18.5%; and for offshore production in areas over 100 meters deep, the royalty would be 16.7%.

Petroleum companies were to be allowed to amortize assets in five equal annual installments to recover investment outlays. Even so, 1% of the initial costs of each asset was to be retained, and could be written off only by official permission of the Commissioner of Petroleum.

A capital investment tax credit was also approved for existing oil companies. This tax credit was to vary according to individual situations. Thus, operations onshore were to have a tax credit of 5%, offshore areas up to and including 100 meters deep 15%, and offshore areas over 100 meters deep 20%. This move was to encourage and reward existing petroleum companies for new investment.

Following announcement of the new petroleum incentives, drilling activity had picked up by mid-1977 from the depressed levels of 1976, and 18 rigs were in operation at that point. By yearend, however, the number of rigs employed had dropped again to 14.

Nigeria was not expected to have a policy for deepwater petroleum development areas until the end of 1978 or early 1979. Terms and arrangements were expected to be somewhat different from those for exploration within the 200-meter boundary.

NNPC began oil exploration in the Lake Chad basin. Exploration by Nigerian AGIP Oil Co. Ltd. had resulted in the discovery of new oil deposits in the Niger Delta, where other Nigeria AGIP producing wells were located. One new well, the Clough Creek I, was producing 1,000 tons of high-grade petroleum per day.

Refining.—The existing refinery called Alesa Eleme located near Port Harcourt, owned 60% by NNPC and 20% each by Shell and BP, was inadequate for Nigeria's needs, resulting in increasing imports of oil products and frequent shortages. The plant's annual capacity of 60,000 barrels per day was being expanded to 75,000 barrels per day. Nigeria was also establishing two new refineries, one at Warri and one at Kaduna.

The refinery at Warri, with a capacity of 100,000 barrels per day, was under construction and is expected to be operating in 1978. The Italian firm SNAM Progetti S.p.A., part of the Ente Nazionale Idro Carburi (ENI) Group, was building this refinery, expected to cost around $630 million. Contracts were signed during 1977 for the Japanese firm Chiyoda Chemical Engineering & Construction Co., Ltd., to build the third refinery at Kaduna. The Kaduna refinery is expected to have a capacity of 100,000 barrels per day and cost about $660 million. A 35,000-barrel-per-day lubricating oil plant was also to be included. Both are scheduled to come onstream in 1980.

Nigeria's petroleum product distribution system is to include 18 storage depots and 3,000 kilometers of pipeline. Pipelines to service the new refineries were being built by Williams International Co. of the United States, Montaggi Materiali Tubolari S.p.A. (Montubi) of Italy, Tsvetmetpromesport of the U.S.S.R., and Iranian Management & Engineering Group Ltd. (IMEG). Williams International is expected to finish its part of the pipeline from Port Harcourt to Makurdi by September 1978, but the Iranian-Soviet section from Kaduna to Port Harcourt is not expected to be finished until 1980. Halcor International of Houston was subcontracted by Montubi to lay 1,100 kilometers of the 1,700 kilometers awarded to Montubi, stretching from Kaduna to Zaria, Kano, Gusau, Jos, Gombe, and Maidurguri. Bids were let for the pipeline that was to extend from Sapele to Ajaokuta to feed the steel mill under construction there. Contracts worth $250 million were awarded to French and Swedish firms for design and construction of petroleum storage depots. When completed, the storage program would provide a 1,342,000-ton capacity, which would be sufficient for up to 90 days' consumption, compared with the present storage capacity of 162,814 tons. These facilities were to be completed by November 1978.

The Federal Military Government acquired 100% interest in Esso Standard Nigeria Ltd., an oil-product marketing company. The name of the company was changed to Unipetrol (Nigeria) Ltd., and it was to be expanded to serve as a vehicle for distribution of refined petroleum products throughout the country.

Uranium.—Nigeria was reportedly investing $1.5 million in a joint venture with the Government of Niger for the purpose of uranium exploration.[15] BRGM Nigeria Ltd., a subsidiary of the French Bureau de Recherches Géologiques et Minières (BRGM),

Digitized by Google

discovered indications of uranium in Nigeria and was continuing its exploration program.

The Mineral Industry of Norway

Joseph B. Huvos[1]

In 1977, Norway—which, thanks to sizable hydroelectric resources, is a major producer of aluminum, magnesium, and ferroalloys—was on its way to becoming a major oil producer. It was also a major ilmenite producer.

The Norwegian mineral industry suffered from the poor performance of the economy as a whole. Rapidly increasing unit wage costs and weak foreign demand eroded Norway's export markets, and the balance of trade reached a deficit of about $5.2 billion.[2] Unemployment was maintained at less than 1% of the work force through subsidies.

In 1977, Norway's gross national product (GNP) was about $34 billion.[3] The contribution of the mineral industry to employment did not change significantly in 1977, remaining at about 11% of the total of about 415,000 (mining, 10,000; mining products, 15,000; and metals, 21,000).

Important developments in Norway's mineral industry in 1977 were the start of natural gas deliveries from the North Sea to Emden, Federal Republic of Germany; stagnation of North Sea oil production because of a blowout; commissioning of a new magnesium chloride plant by Norsk Hydro A/S; commissioning of an extension of A/S AArdal og Sunndal Verk's (ASV) AArdal aluminum smelter; and discoveries of iron and phosphate ores in mainland Norway and of coal, uranium, and offshore oil in the Svalbard Islands. Government measures included formation of an Oil and Energy Ministry; formal establishment of a price support fund for copper; and authorization for Elkem-Spigerverket A/S to build an additional electric arc furnace for ferrosilicon.

PRODUCTION

In 1977, total production in mining, industry, and power increased about 10% over that of 1976, but there was a slight decrease in crude oil production. Production of mineral commodities is shown in table 1. The following tabulation shows the major producers of mineral commodities:

Digitized by Google

Commodity	Major producers	Principal facilities	Principal ownership	Percent of output
Aluminum	A/S AArdal og Sunndal Verk	Smelters at AArdal, Sunndalsora, Hoyanger.	Government 75% and Alcan Aluminium Ltd. (Canada) 25%.	45
	Mosal Aluminium A/S	Smelters at Mosjoen and Lista Island	Elkem-Spigerverket A/S 50% and Aluminum Co. of America (Alcoa) 50%.	25
	Norsk Hydro A/S	Smelter on Karmoy Island	Government 51%	17
	Sor-Norge Aluminium A/S	Smelter at Husnes	Alusuisse 75% and Norsk Hydro A/S 10%	10
Coal	Store Norske Spitsbergen Kulkompani A/S.	Mines at Longyearbyen and Svea	Government	100

TRADE

Norway's trade deficit in 1977 increased to $5.2 billion, caused both by the high level of domestic demand, including investment in North Sea oil equipment, and by reduced competitiveness of domestic goods in domestic markets.

Nonferrous metals (aluminum, magnesium, and nickel), ferroalloys, rolled steel, and liquid fuels were the country's main export items. Liquid fuels, iron and steel, alumina, and nickel matte were the main import items. Norway's mineral commodity trade in 1976 and 1977 is shown in tables 2 and 3.

Table 2.—Norway: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Alumina	2	3	NA.
Metal including alloys:			
Scrap	r8,524	10,148	West Germany 5,816; Sweden 1,341.
Unwrought	451,500	561,791	West Germany 168,497; United Kingdom 115,632; Netherlands 50,970.
Semimanufactures	37,143	50,271	United Kingdom 16,098; Sweden 10,769; Denmark 6,328.
Cadmium	61	93	NA.
Cobalt	601	936	NA.
Copper:			
Ore and concentrate	83,270	105,715	West Germany 79,728; Sweden 19,648.
Oxide and hydroxide	2,154	3,000	Taiwan 20; Poland 18; Nigeria 15; Czechoslovakia 10.
Metal including alloys:			
Scrap	r1,362	2,303	West Germany 1,408; Belgium-Luxembourg 454.
Unwrought:			
Unrefined	6,969	5,865	All to West Germany.
Refined	18,363	16,111	United Kingdom 4,620; Sweden 3,711; West Germany 2,607; France 2,292; Netherlands 1,653.
Semimanufactures	1,837	1,978	Sweden 1,153; West Germany 285; Denmark 248; United Kingdom 192.
Gold metal, unworked or partly worked troy ounces	2,025	6,687	West Germany 1,575; Denmark 997; France 868.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	3,154	2,729	United Kingdom 1,109; West Germany 987; Poland 250.
Roasted pyrite	113,194	137,842	West Germany 109,167; Denmark 23,337.
Metal:			
Scrap	r19,515	17,826	West Germany 7,025; Spain 6,817; Sweden 3,406.
Pig iron, including cast iron	100,863	96,613	United Kingdom 36,110; West Germany 21,673; Poland 11,350.
Ferroalloys:			
Ferromanganese	256,639	327,222	West Germany 61,417; United Kingdom 44,366; Sweden 41,000.
Other	385,969	446,327	West Germany 117,327; United Kingdom 108,691; United States-Puerto Rico 58,988.
Steel, primary forms	r185,297	207,107	Netherlands 154,759; West Germany 21,169.
Semimanufactures:			
Bars, rods, angles, shapes, sections	217,809	189,963	United Kingdom 42,695; Sweden 39,152; Denmark 27,744; West Germany 25,882.
Universals, plates, sheets	129,073	163,104	Sweden 59,784; United Kingdom 39,712; Denmark 26,985.
Hoop and strip	13,422	22,924	Sweden 14,515; United Kingdom 3,075; Denmark 2,467.
Rails and accessories	r249	--	
Wire	4,772	6,785	United Kingdom 1,751; Portugal 1,311; Iran 1,111.
Tubes, pipes, fittings	r36,495	37,744	Sweden 17,188; Denmark 8,751; United Kingdom 5,728.
Castings and forgings, rough	r12,823	7,347	Sweden 5,401; Liberia 1,165.
Total	r414,643	427,867	
Lead:			
Ore and concentrate	4,100	4,599	West Germany 2,389; Netherlands 2,210.
Oxide	14	32	United Arab Emirates 18; Thailand 13.
Metal including alloys:			
Scrap	4,744	7,017	Denmark 3,811; Sweden 3,189.

Major items of mineral imports from the United States were coal, coke, asphalt, and iron and steel semimanufactures. Major mineral exports to the United States included crude oil and residual fuel oil, cement, nickel, ferroalloys, aluminum, other nonferrous metals, and iron ore concentrates. United States-Norwegian mineral trade in 1976 is shown in table 4.

Table 4.—Norway: Mineral trade with the United States, 1976[1]

COMMODITY REVIEW

METALS

Aluminum.—The recovery of the aluminum market in 1977 initially improved financial conditions, but prices remained depressed. Lack of rain caused power shortages, and power was imported or in some instances metal production was curtailed. Aluminum production was at about 90% of capacity.

Elkem-Spigerverket increased its share of interest in Mosal Aluminium A/S from 50% to 55%, and Aluminum Co. of America's (Alcoa) share was reduced to 45%.

The Norwegian Government approved the expansion of ASV's Hoyanger smelter located on the Sognefjord and authorized utilization of several rivers in the area for generating power. By 1981, the plant's annual capacity is to be increased from the present 28,000 tons to 75,000 tons per year. Recent investments at the site, including that in a new casting plant, amounted to $300 million. At yearend, ASV completed reconstruction of two sections of its Ardal (Sognefjord) reduction plant, raising production capacity to 182,000 tons per year.

Norsk Hydro applied to the Government for increased power supplies for its Karmoy Island smelter. The plant's capacity was to be expanded from 120,000 tons to 180,000 tons per year at a cost of $70 million.

Ownership, location, and capacity of Norwegian primary aluminum plants are shown in table 5.

Table 5.—Norway: Producers of primary aluminum

Company	Ownership	Plant location	Yearend annual capacity (thousand metric tons)
A/S AArdal og Sunndal Verk.	Government 75% and Alcan Aluminium Ltd. (Canada) 25%.	AArdal (Sognefjord)	182
		Sunndalsora (Tingvollfjord).	120
		Hoyanger (Sognefjord)	28
Mosal Aluminium A/S	Elkem-Spigerverket A/S 50% and Aluminum Co. of America (Aloca) 50%.	Mosjoen (Vejsnafjord)	95
		Lista Island	82
Norsk Hydro A/S	Government 51% and several private interests 49%.	Karmoy Island	120
Sor-Norge Aluminium A/S	Alusuisse 75%, and Norsk Hydro 10%, several private interests 15%.	Husnes (Hardangerfjord)	72
DNN Aluminium A/S	Alcoa 50% and British Aluminium Co. Ltd. 50%	Tyssedal (near Odda on the Sorfjord).	24

Copper, Lead, Zinc.—To ease the financial difficulties of the copper-mining companies caused by low copper prices, the Norwegian Government in 1977 formally established a Government copper fund amounting to $57 million, $19 million of which was earmarked retroactively for 1976. The fund was to compensate copper mines if the copper price fell 10% under a predetermined "base price" and was to be replenished if copper prices exceeded it. Payments to companies amounted to $15,000 per copper miner per year.

Norway's 12 small complex sulfide ore mines, distributed throughout the country, were operated by 10 independent companies. The ores mined contained mostly copper, lead, zinc, and iron sulfides. Among the more important mines were Sulitjelma Gruber A/S's Fauske mine, east of Bodo (copper, lead, and zinc); Grong Gruber A/S's Royrvik mine, near the Swedish border (copper and zinc); Folldal Verk A/S's Dovre and Kvalsund mines, in southern and northern Norway, respectively (copper, zinc, and pyrites); and Orkla Industrier A/S's Meldal mine, south of Trondheim (copper, zinc, and pyrites).

Some copper ores were processed at Sulitjelma Gruber's 10,000-ton-per-year Sulitjelma copper smelter east of Bodo, but most copper and all lead ores of domestic origin were exported. Det Norske Zinkkompani NS's Odda electrolytic zinc smelter processed all domestic and some imported zinc concentrates.

Iron Ore.—In 1977, the first large (120,000-deadweight-ton) ore carrier was

Digitized by Google

loaded at Kirkenes with iron ore pellets from A/S Sydvaranger's taconite operation located north of the Arctic Circle. The vessel's destination was British Steel Corp. at Redcar on the eastern coast of the United Kingdom.

Construction continued on expanding the iron ore loading facilities of Narvik, one of the world's largest ore shipping ports, from 23 million tons to 30 million tons per year. Narvik is the main port on the Atlantic Ocean used by Luosssavaara-Kiirunavaara AB (LKAB), the Swedish iron mining concern. Expenditures at the port during the 1970's will reach $150 million.

A/S Rana Gruber reported the discovery of 20 million tons of recoverable reserves of iron ore in the Valnesfjord area, 100 kilometers east of the Lofoten Islands.

Norsk Hydro secured the mining rights for iron ore deposits at Kodal, west of Tonsberg, southern Norway. Reserves were estimated at 70 million tons, and construction of an 800,000-ton-per-year mine is under consideration.

Three of Norway's iron ore mines were Government-owned: Sydvaranger's Kirkenes mine north of the Arctic Circle, Rana Gruber's Rana mine near Mo, and Fosdalens Bergverks A/S's mine at Verran, in southern Norway. Elkem-Spigerverket's subsidiary, Titania A/S, produced a magnetite concentrate byproduct from its ilmenite mine at Telnes in Sokndal in southern Norway.

Iron, Steel, Ferroalloys.—The Norwegian Government authorized the installation of a fourth electric arc furnace at Elkem-Spigerverket's Salten plant, raising the company's ferrosilicon capacity from 80,000 tons to 112,000 tons per year. In the meantime, the plant will temporarily close one of its three ferrosilicon furnaces because of the Government's electric power quotas.

Elkem-Spigerverket's Bremanger Smeltverk at Svelgen continued production of ferrosilicon and ferrovanadium.

Besides the three major steelmakers—A/S Norsk Jernwerk at Mo i Rana (Government-owned), Elkem-Spigerverket at the Nydalen plant near Oslo, and Stavanger Stal at the Jorpeland (Stavanger) plant on the western coast—about nine more Norwegian companies produced ferroalloys at 15 locations.

Magnesium.—In 1977, Norsk Hydro commissioned a 15,000-ton-per-year magnesium chloride plant at its Porsgrunn factory at Heroya, southern Norway.

The deteriorating market outlook for magnesium and escalating production costs in Norway forced Norsk Hydro to definitely shelve its plans to start work in 1978 on a 100,000-ton-per-year magnesium plant at Mongstad on the Fensfjorden. Thus, the company's 70,000-ton-per-year Porsgrunn plant remained the country's only magnesium smelter.

Nickel, Cobalt, Platinum-Group Metals.—Operating rates increased somewhat in 1977, but remained far below the maximum rates of earlier years at Falconbridge Nikkelverk A/S's Kristiansand refinery, a subsidiary of Falconbridge Nickel Mines Ltd. of Canada. The company processed imported copper-nickel matte into nickel, cobalt, some copper, and precious metals.

Titanium.—Ilmenite production increased owing to new capacity commissioned in 1975 at Titania's Sokndal mine in Dalane, southern Norway. The company, a subsidiary of N L Industries, Inc. (United States), produced some titanium pigment from ore at its Kristiansand plant, but most mine production was exported.

Vanadium.—Elkem-Spigerverket produced vanadiferous iron ores at the Nesset mine, east of Molde on the western coast.

NONMETALS

Cement.—In 1977, A/S Norcem, the country's only cement producer, operated three cement plants with a total capacity of 2.3 million tons per year. The 1-million-ton-per-year Brevik and Slemmestad plants were located in the south; the 0.3-million-ton-per-year Kjopsvik plant was in the north of the country.

Fertilizer Materials.—Norsk Hydro discovered 13 million tons of phosphate ore reserves in association with 32 million tons of iron ore at Kodal, Vestfold County.[4] The company was studying a project to produce from the ore 300,000 tons per year of apatite concentrate and 80,000 tons per year of magnetite at a capital cost of $150 million.

Norsk Hydro continued to account for most Norwegian fertilizer materials. Of the company's ammonia capacity of 830,000 tons per year, 500,000 tons was located at Heroya in southern Norway on the Frierfjord.

MINERAL FUELS

In 1977, 70% of Norway's energy output consisted of petroleum and gas, and 28% was hydroelectric power; coal producion was insignificant. The country was a net exporter of oil and natural gas, the latter for the first time.

Norway's supply and apparent consumption of fuels and power in 1976 and 1977 are shown in table 6.

Digitized by Google

Table 6.—Norway: Supply and apparent consumption of fuels and power

(Million tons of standard coal equivalent[1])

Year	Total energy	Coal	Petroleum and refinery products	Natural gas	Hydroelectric power[2]
1976:

Source: U.S. Embassy, Oslo, Norway. Foreign Economic Trends and Their Implications for the U.S.: Norway. U.S. Department of Commerce. 78-086, August 1979.

Coal.—According to the Norwegian Ministry of Industry, coal and uranium were found in the Svalbard Islands by an Arctic expedition partly financed by the Federal Republic of Germany. The uranium was located at Dickson Fjord and the coal at Gipsfjord, both on Vestspitsbergen Island.

Government-controlled Stora Norske Spitsbergen Kulkompani A/S decreased production of low-sulfur coal at the Longyearbyen mine on Spitsbergen Island. Production of coal at the Svea mine near Van Mijenfjorden is now scheduled to start in 1983. The U.S.S.R. continued to mine an estimated 400,000 tons of coal per year at Barentsburg and Piramiden near Longyearbyen.

Petroleum and Natural Gas.—The Norwegian sector of the North Sea was the scene of continuing development and of efforts to cope with setbacks and delays in production. One setback was a blowout at platform B of the Ekofisk oilfield (capped and controlled in April) which caused a slight decrease in North Sea oil output in 1977.

The Norwegian Petroleum Directorate lowered its future oil production estimates for the Ekofisk and Statfjord oilfields. Current proven recoverable reserves in the Norwegian North Sea are put at about 680 million tons of oil, 700 billion cubic meters of gas, and 20 million tons of natural gas liquids, totaling 1.4 billion tons of oil equivalent.[5]

At yearend, the Norwegian Government announced the formation of a new Oil and Energy Ministry, which will have five divisions.[6] Two of the divisions will be responsible for oil and one each for hydroelectric power, planning, and administration. Previously, North Sea oil was under the jurisdiction of the Ministry of Industry.

During 1977, the Ministry of Industry recommended to the Parliament further allocations of blocks in the North Sea to counteract a possible future decline in the level of oil output. Of 15 blocks in the Statfjord area proposed for announcement, 8 were to be allocated in the spring of 1978. It was hoped to determine if sufficient reserves exist to sustain a North Sea trunkline to the Norwegian mainland.

The year 1977 marked the start of natural gas deliveries from Ekofisk Field to Emden, Federal Republic of Germany, and from there to consumers in the Federal Republic of Germany, the Netherlands, Belgium-Luxembourg, and France, and also from Frigg Field to St. Fergus on the United Kingdom's eastern coast. Norway's natural gas deliveries in 1977 from all fields were about 2.7 billion cubic meters.

In August, Norsk Polar Navigasjon A/S spudded a well on the Tromsobreen anticline in South Spitsbergen. The well was later suspended for the winter.

Of a total of 16 holes drilled in 1977 in the Norwegian sector of the North Sea, there were 4 wildcats, 5 exploration wells, and 7 appraisal wells; there were no development wells.

Ekofisk Field is located in block 2/4, 270 kilometers southwest of Lista, in 72 meters of water. It is the center of a development program involving seven other fields (West Ekofisk, Cod, Tor, Edda, Edfisk, Albuskjell, and Valhall). The oil goes by a 34-inch, 354-kilometer pipeline to Teesside, United Kingdom, and the gas by a 36-inch, 431-kilometer pipeline to Emden, Federal Republic of Germany. All adjoining fields are

to be linked by pipeline to Ekofisk Center, the central platform of Ekofisk Field. The project embraces 25 steel structures standing on the seabed, 12 of which are drilling platforms. Ekofisk itself has 3 drilling platforms totaling 30 oil wells, 5 gas wells, and 3 natural gas liquid wells.

The following tabulation gives details on the other seven fields involved in the Ekofisk development program:

Field	Location		Depth of water (meters)	No. of drilling platforms	No. of wells	Diameter (inches) and type of pipeline to Ekofisk Center
	Block	Orientation to Ekofisk				
In production:						
West Ekofisk	2/4	8 kilometers northwest	67	1	10	24.
Cod	7/11	80 kilometers northwest.	79	1	6	16 (oil and gas).
Planned:						
Tor	2/4 and 2/5	12 kilometers northeast.	69	1	15	12 (oil) and 14 (gas).
Edda	2/7	13 kilometers southwest.	72	1	10	10 (oil) and 12 (gas).
Edfisk	Do.	24 kilometers south	73	2	19 and 30	24 (oil) and 30 (gas).
Albuskjell	2/4 and 1/6	14 kilometers northwest.	67	2	12 and 1	18 (oil) and 24 (gas).
Valhall	2/10	32 kilometers southeast	70	1	NA	NA.

NA Not available.

Statfjord Field's Norwegian sector is located in blocks 33/9 and 33/12, 200 kilometers northwest of Mongstad in 146 meters of water. The concrete A platform was installed in 1977, the Concrete B platform will be installed in 1981, and a third platform was under consideration. Crude oil transportation will be initially by tankers. A pipeline across the Norwegian trench to Sotra near Bergen was also under study.

On December 31, 1977, Norwegian refinery throughput capacity remained at 12.9 million tons per year.[7]

The Mineral Industry of Pakistan

By David E. Morse[1]

Pakistan's mineral industry played a minor role in the nation's economy in 1977. Development of the mineral industry has been hampered by the Governments' low-priority view of the mineral and other industries based on mineral products. A paucity of trained personnel and the non-availability of modern mining equipment have also impeded progress in the mineral sector. The capital-intensive nature of mineral development and the complexity of Pakistan's mining laws have deterred active participation by private investors.

The presence of a number of Federal and provincial agencies promoting mineral development caused confusion owing to the overlapping nature of some of these agencies. Pakistan Mineral Development Corp. (PMDC) was responsible for exploration, evaluation, and exploitation of mineral commodities (excluding petroleum, natural gas, and uranium) throughout Pakistan. Oil & Gas Development Corp. (OGDC) was responsible for exploration, development, and exploitation of Pakistan's oil and natural gas resources, and the Pakistan Atomic Energy Commission was responsible for uranium exploration and development. Provincial agencies involved with mineral development were the Baluchistan Development Authority (BDA), Punjab Mineral Development Corp. (PUNJMIN), and the Sarhad Development Authority of North-West Frontier Province. In addition, the Agency for the Federally adninisterod Tribal Areas was responsible for mineral development in tribal areas in Baluchistan and North-West Frontier Provinces. Resource Development Corp. (RDC) was concerned with the development of the Saindak copper deposits in western Baluchistan.

Widespread civil disturbances following the March 1977 general elections and severe floods combined to limit Pakistan's economic growth to 2.8% in fiscal 1976-77[2] compared with a projected increase of 8.1%. The civil unrest was abated when the Army took over the Government and established the Martial Law Administration (MLA) in early July.

PRODUCTION

Production of mineral commodities in Pakistan was of only domestic importance in 1977 as most of the country's mineral output was consumed locally. Mining and quarrying registered a growth of 5% in 1977 but contributed only about 0.5% to the country's gross domestic product. Crude oil and natural gas were bright spots as oil production rose 45% to 3.7 million barrels. Pakistan produced significant quantities of clays, coal, gypsum, rock salt, sand and gravel, and stone. In addition, small amounts of barite, bauxite, chromite, marble, ochers, soapstone, and sulfur were produced during the year. Pakistan also utilized domestic raw materials for the manufacture of cement and fertilizers.

TRADE

Pakistan's trade deficit continued to increase in fiscal 1976-77 as imports increased 12% to $2.3 billion[3] and exports were essentially stagnant at $1.14 billion. The trade deficit for the July to December 1977 period averaged $111 million per month. Pakistan was able to finance a substantial portion of the deficit with foreign aid and remittances from Pakistanis working overseas.

During fiscal 1976-77, Pakistan's mineral trade deficit was approximately $736 million. Cement, chromite, and petroleum products were the only significant mineral exports. Imports of crude oil and petroleum products increased from $377 million in fiscal 1975-76 to $426 million in fiscal 1976-77. Other major mineral imports included iron and steel products and chemical fertilizers. Pakistan planned to decrease its mineral trade deficit by building fertilizer plants and a major steel mill and increasing domestic crude oil production.

Table 2.—Pakistan: Imports of mineral commodities[1]

COMMODITY REVIEW

METALS

Chromite.—Most of Pakistan's chromite production came from the Zhob Valley region of Baluchistan near Muslimbagh. BDA, with assistance from the Pakistan Council of Scientific and Industrial Research, planned to set up a 20-ton-per-day pilot plant to treat low-grade chromite ores of the Zhob Valley. Government plans for chromite development at Muslimbagh included an 18,000-ton-per-year concentrator, a 15,000-ton-per-year ferrochrome plant, and a refractory brick plant. Chromite production was to be expanded to 40,000 tons per year by 1981.[4]

Digitized by Google

Copper.—Seltrust Engineering Ltd. of the United Kingdom completed a feasibility study of the Saindak copper deposits located near the Iranian border in Chagai District, Baluchistan. A 12,500-ton-per-day mine and mill that would produce 165 tons per day of copper concentrate, 250 tons per day of magnetite concentrate, and 205 tons per day of pyrite concentrate was recommended to RDC. The concentrates would be shipped to Port Qasim near Karachi where a copper smelter and facilities to produce sulfuric acid and steel billet would be established. The end products were to be 15,000 tons per year of blister copper, 80,000 tons per year of steel billets, and 150,000 tons per year of sulfuric acid. RDC planned to begin shipments from Saindak in late 1981.

Iron and Steel.—During 1977, Pakistan's steel output came from processing domestic and imported scrap and from shipbreaking operations. More than 100,000 tons of equipment and materials arrived during 1977 from the U.S.S.R. for the new Pipri steelworks that was being built by Pakistan Steel Mills Corp. When completed in fiscal 1980-81, the mill is to produce 1.1 million tons of raw steel per year, employ 15,000 workers, and reduce imports of steel products. Port Qasim, also under construction during 1977, was to handle the imports of iron ore and coal for the new steel mill. Coal and Allied Industries of Australia won a contract to supply 1 million tons of coking coal for the project. Deliveries were to begin at 100,000 tons per year in 1978-79 and increase to 400,000 tons per year.

NONMETALS

Cement.—Cement production from Pakistan's nine cement plants increased modestly during 1977. Owing to increased domestic consumption, cement exports to the Middle East market decreased nearly 90% from fiscal 1974-75 to fiscal 1976-77. Pakistan's projected cement consumption for 1980 was 5.1 million tons per year, and State Cement Corp. has initiated several projects to increase existing capacity by 1.5 million tons per year. Plants at Javedan and Mustekham were to be expanded by 300,000 tons per year each, and a new unit of equal capacity was to be built with Iranian assistance at Spintangi. In addition, Japan was to lend Pakistan $28 million for new cement plants at Dandot and Thatta.

Fertilizer Materials.—Imports of nitrogenous and phosphatic fertilizers were valued at nearly $66 million in fiscal 1976-77. Pakistan did not import potassic fertilizers in 1977 and had no facilities for their production.

Nitrogenous.—During 1977, Pakistan had four fertilizer plants producing nitrogenous fertilizers. Esso Pakistan Fertilizer Co., Ltd., located at Daharki utilized natural gas from the Mari natural gas field for the production of urea using the Kellogg ammonia and Toyo Koatsu total recycle urea process. Rated capacity was 80,000 tons per year (nitrogen content) urea (46-0-0), although the plant operated above rated capacity during 1977. The Dawood Hercules Chemicals Ltd. plant located at Chickoki, utilizing Sui natural gas and the same process as the Esso plant, had a rated capacity of 158,000 tons per year (nitrogen content) urea. National Fertilizer Corp. (NFC) of Pakistan operated two fertilizer plants at Multan and Daudthel with a combined capacity of nearly 54,000 tons per year (nitrogen content) in a variety of products.

During 1977, two major new plants were under construction. Pakarab Fertilizer Ltd., a joint venture of NFC and Abu Dhabi National Oil Co., was building a $127 million expansion to NFC's Multan fertilizer plant. The expansion, to be in production in late 1978, is to have nitric acid, ammonia, ammonium nitrate, calcium ammonium nitrate, and complex fertilizer (21-21-0) facilities. NFC, with financing provided by Saudi Arabia and the Asian Development Bank, was building a 1,000-ton-per-day ammonia, 1,750-ton-per-day urea facility at Mirpur Mathelo near Sukpur, Sind. The plant is to utilize natural gas from the Mari field as feedstock and be commissioned in 1979.

Phosphatic.—PD-NCB Consultants Ltd. of the United Kingdom completed an initial study of the phosphate potential of the Hazara District of North-West Frontier Province in 1977 and began development of a 120-ton-per-day phosphate mine at Kakul which was to supply the needs of NFC's superphosphate plants at Jaranwala and Faisalabad. PD-NCB was also investigating phosphate deposits at Lagarban in the Abbottabad District during the year.[5]

Salt.—During 1977, rock salt production in Pakistan increased 2.7% to 385,000 tons.[6] PMDC planned to upgrade salt mining operations in the Salt Range to bring production to 535,000 tons per year. Solar-evaporated salt was produced by 19 small coastal operations during 1977.

Digitized by Google

MINERAL FUELS

Coal.—PMDC planned to increase its coal output from 250,000 tons to 1.6 million tons per year by 1983. The major development would be a 3,000-ton-per-day operation that would feed a new 250-megawatt powerplant at Janshoro, Sind, from the Lakera coalfields.

Natural Gas.—OGDC discovered natural gas in commercial quantities in late October with the completion of Pir Koh 1 (29°08' N. 69°05' E.) in Baluchistan, about 50 kilometers north of the large Sui natural gas field. Seven development wells were completed in Pakistan during 1977, five in the Mari field and two in the Sui field.

Gross natural gas production increased to 5 billion cubic meters in 1977. Pakistan Petroleum Ltd. (PPL) sold 4.35 billion cubic meters from the Sui field, and Pakistan Oilfields Ltd. (POL) sold 165 million cubic meters of desulfurized gas that was produced in association with crude oil from the Meyal oilfield during the year. Output from the Mari field averaged approximately 1 million cubic meters of natural gas per day and was used by the urea fertilizer plant at Daharki.

Sui Gas Transmission Co., Ltd., completed the Indus Right Bank Gas Pipeline in 1977. The 45.7-centimeter-diameter, 488-kilometer-long, high-pressure line had a free-flow capacity of 3.85 million cubic meters per day and raised the gas transmission capacity south of the Sui field to over 8 million cubic meters per day. Total cost of the project was $90 million.

Petroleum.—Crude oil production increased 45% in 1977, but the output of 10,000 barrels per day provided only 11% of the nation's requirements. The Meyal oilfield was the major producer, averaging nearly 6,800 barrels per day. Development wells completed in 1977 were Meyal No. 7 drilled by POL and the Tüt No. 7 drilled by OGDC. OGDC spudded Tüt No. 8 in 1977 and was rigging up for Tüt No. 9 at yearend.

PPL (as operator) and Amoco Pakistan Exploration Co., in a joint venture, spudded Adhi 5 (38°08' N. 73°09' E.) during August in PPL's East Potwar concession area. The four previous wells drilled in this concession were abandoned because of high pressure or failure to penetrate the objective horizon owing to structural complexity. Texasgulf Inc., in partnership with POL, spudded Karak 1 (33°06' N. 71°13' E.) in August and was drilling at yearend. OGDC spudded the Kot Rum 1 wildcat (26°17' N. 70°09' E.) about 105 kilometers northeast of the Sui gasfield in December with a newly acquired 20,000-foot-capacity rig.

OGDC planned to begin development of the Dhodak oilfield field in 1978. The 10-well, $125 million program, expected to produce 22,500 barrels per day of oil and 64 million cubic feet per day of natural gas, is to be completed in 1981.

Pakistan had three petroleum refineries in operation during 1977. National Refinery Ltd. (NRL) and Pakistan Refinery Ltd., both Government owned and located near Karachi, processed imported crude oil. Attock Oil Co. Ltd. (AOC) processed domestic crude oil at its Rawalpindi refinery in northern Pakistan.

AOC planned to increase the capacity of the Rawalpindi refinery from 11,600 barrels to 31,600 barrels per day to accommodate the increased output of the Tüt and Meyal oilfields. A new 40,000-barrel-per-day refinery was under construction at Multan in south-central Punjab. Crude oil for the refinery, a joint Pakistan-Abu Dhabi venture, was to be imported and transported by pipeline from Karachi. The 12,500-barrel-per-day expansion to NRL's plant is to be commissioned in early 1978. Pakistan's refining capacity is to increase from 106,000 barrels to 181,000 barrels per day by fiscal 1980-81.

The Mineral Industry of Peru

By Orlando Martino[1]

The real rate of growth of Peru's gross domestic product (GDP) in 1977 declined 1.2% compared with the modest increases in 1975 and 1976 and the average of almost 6% for the 1972-74 period. A positive growth rate of 3.7% had been officially forecast for 1977. The annual average price increase of 1977 was 38% compared with the 45% inflation rate of 1976. During 1977 practically all of Peru's economic sectors experienced declines in real terms, with the exception of the mining industry which grew 30% compared with 9% growth in 1976. However, growth in mineral production was expected to slow to 15% during 1978. The value of output by Peru's mineral industry accounted for 8.3% of the GDP of $12.5 billion[2] at current prices, compared with the 6.3% share in 1976. The value of mineral exports increased 20% to $874 million, providing 52% of Peru's total foreign exchange earnings.

Peru's export-oriented mineral industry was dominated by copper, silver, zinc, iron ore, and lead, in that order. Of lesser importance were bismuth, molybdenum, tungsten, selenium, tellurium, indium, cadmium, and nonmetal such as barite, limestone, and gypsum.

The outstanding mining and mineral fuels developments marking the year were the inauguration of the Cerro Verde-Stage I copper project of Empresa Minera del Perú (Minero Perú) and the beginning of oil delivery at Port Bayóvar through the new trans-Andean pipeline of Petróleos del Perú (Petroperú). Empresa Minera del Centro del Perú (Centromin Perú) achieved a record high in output of refined copper and continued six rehabilitation and expansion projects covering its several operating units.

The Banco Minero del Perú continued assisting the medium and small mining sector with loans totaling the equivalent of $74 million, a 36% increase over 1976 lending in local currency terms. The Banco Minero was evaluating 70 mining projects and investment credit applications from small- and medium-scale mining operations which were estimated to increase export earnings by $29 million. The Banco Minero was applying for a $12 million loan from the Inter-American Development Bank and a $2 million credit from the Andean Development Corporation (CAF) for financing capital goods imports. The Banco Minero obtained a consignment of equipment from Canada valued at Can$5 million to be resold to medium-scale mining operations on easy repayment terms.

The Banco Minero also operated six ore beneficiation plants located in Cajamarca, La Libertad, Ancash, Huancavelica, Ica, and Puno Departments to help small miners. During 1977, 76,000 tons of ore was treated, a 65% increase over ore treated in 1976. The Banco Minero continued giving special attention to gold placer mining, locating several promising prospects. The two most important are at Huaypetue and Alto Laberinto in the Department of Madre de Dios.

In early 1977, the Government issued the Organic Law for the Instituto de Geológia y Mineria (INGEOMIN) granting it administrative and financial autonomy. INGEOMIN supervises the exploration, evaluation, and recording of mineral resources in Peru. With the assistance of the technical missions from France, the Federal Republic of Germany, Japan, and Romania, INGEOMIN was carrying out studies on prospects for nickel, gold, and silver. The Instituto Científico y Tecnológico Minero (INCITEMI) continued its scientific investigations in the areas of geology, mining, and metallurgy.

Government Policies and Programs.—In June the Government announced further tightening of the austerity program that

Digitized by Google

had been initiated in September 1976. The austerity program was designed to reduce inflation and to improve Peru's balance of payments by reducing government spending and cutting back public sector imports. By yearend, it was not clear what impact the proposed stabilization program would have on the development projects of the State-owned mining companies.

The Government took several actions during 1977 to improve the investment climate for the private sector. The Government has become more aware that it is not in a position to develop by itself the considerable and varied mineral potential of Peru and was expected to invite the private sector, and foreign, to participate in the development of several known mineral deposits. In particular, the Government expressed interest in providing incentives for gold placer mining and was in the process of drafting relevent legislation. The Government notified the State-owned companies that they will have to finance their own projects rather than depend on government funding as in the past. This indicates that private investors will have greater opportunities to participate in mineral projects in Peru.

In March the Government approved two new laws in the petroleum sector empowering Petroperú to negotiate contracts with foreign oil companies for secondary recovery and for new oil exploration offshore and in the Amazon basin. These laws allow more flexibility in contract terms than was available under the "Peruvian model" contract and were regarded as designed to encourage foreign oil companies to operate in Peru.

A new Industrial Community law (Decree-Law 21789) was promulgated in February that replaced the original law of September 1970. Under the old law, 25% of pretax profits were destined to a firm's "industrial community," with 10% paid out as profit sharing and 15% allocated to purchase shares of the firm's equity until workers, through their industrial community, came to own half of the firm's paid in capital. The new law retains profit sharing but alters the formula so that an industrial community cannot acquire more than one-third of a company's paid in capital. One intent of the law was to resolve the ownership issue and managerial rights.

PRODUCTION

Peru's production of minerals and mineral fuels is shown in table 1. Production of copper, silver, zinc, iron ore, and lead, Peru's five principal mineral commodities in order of export value, increased in 1977—especially mine copper and iron ore, which increased 62% and 32%, respectively. The sharp increase in copper output reflected the startup of the Cerro Verde-Stage I and the first full year of operation of the Cuajone open pit mine in southern Peru. Of the precious metals, mine silver output increased 7% and gold, 20%. Peru was Latin America's most important producer of barite, ranking third in the world.

Peru approached self-sufficiency in petroleum with the initial port delivery of crude oil through the trans-Andean oil pipeline in mid-1977. Increased output from oil wells in the Amazon basin more than compensated for the declining trend in output from the northwest coast fields and the continental shelf.

Some labor unrest continued in 1977. According to the records of the Peruvian Mining Society, 16 strikes occurred resulting in a loss of 633,000 worker-hours compared with 29 strikes in 1976 resulting in loss of 575,000 worker-hours. Strikes were motivated by requests for pay increases and mainly for reemployment of mining personnel discharged under Decree-Law 21462 of April 1976 which declared the Peruvian mining industry in a "state of emergency" and authorized mining companies to dismiss personnel involved in work stoppages declared illegal. Approximately 77,000 persons were employed in the mining industry: 27,000 in the large scale mining sector, 40,000 in the medium sector and 10,000 in the small sector.

TRADE

As a developing country in an early industrialization stage, Peru consumed a small part of its mineral production and exported about 97% of its copper, 96% of its silver, 96% of its zinc, 98% of its iron ore, and 95% of its lead. The upward trend in the value of Peru's mineral exports continued in 1977. Mineral exports were valued at $874 million in 1977, compared with $696 million for 1976 and $560 million for 1975, and represented 53% of the country's total export earnings. The Government reported the following data for 1977 for Peru's five leading mineral commodity exports.

Commodity	Quantity	Change (percent) 1976-77	Value f.o.b. (million dollars)	Change (percent) 1976-77	Share of total exports (percent)
Copper metric tons	311,300	+63	$363	+65	22
Silver thousand troy ounces	42,471	+7	172	+21	10
Zinc metric tons	398,700	-12	126	-19	8
Iron ore do	4,120,000	+40	85	+42	5
Lead do	162,700	-6	78	+56	5
Other mineral products	NA	NA	50	-17	3
Total minerals	NA	XX	874	+20	53
Total exports	XX	XX	1,666	+23	100

NA Not available. XX Not applicable.

The United States (17%) was the most important market in 1977 for Peruvian copper followed by Japan (13%), United Kingdom (9%), Latin America (9%), and Italy (8%).

About 76% of Peru's mineral exports are shipped as refined products and Peru expects to refine all of its ores and concentrates by the year 2000. In 1977 Peru had the capacity to refine 95% of its copper, 50% of its lead and zinc, and 3% of its iron ore.

Total imports by Peru in 1977 amounted to $2,164 million; about the same as in 1976. Imports of crude oil, valued at $190 million, continued as one of the leading items among mineral imports.

COMMODITY REVIEW

METALS

Copper.—In 1977 Peru ranked seventh as a world producer of copper and contributed 4.2% of total world production. During 1977 there were significant increases in all major copper products: Refined copper, blister copper, and ores and concentrates—but especially blister copper, which increased 66%. This was the first full year in which the Ilo smelter handled the combined output of the Toquepala and Cuajone copper mines.

The increase in copper production was primarily due to the new output from the Cuajone mine of Southern Peru Copper Corp. (SPCC) that contributed its first full year of operation, the startup of the Cerro Verde-Stage I mine of Minero Perú and the expansion of the Raul mine, about 91 kilometers south of Lima, owned by Cia. Minera Pativilca S.A.

The inauguration of Cerro Verde-Stage I in mid-1977 represented the first mine to be placed in operation by Minero Perú since its assignment by the Government in 1970. The $198 million project to exploit Cerro Verde's copper oxide ores was expected to eventually produce 33,000 tons of fine copper per year. However, during the initial year, 8,750 tons of copper cathodes was produced, and 25,000 tons was projected by 1978. Minero Perú continued planning of Cerro-Verde-Stage II for developing 1.2 billion tons of copper sulfide ore with an average grade of 0.64% copper. Five companies from Canada, Japan, and Italy presented proposals for constructing Phase I of Cerro Verde II, on a turnkey basis, to produce 60,000 tons of contained copper in concentrate.

As operator of the two largest copper mines in Peru, Toquepala and Cuajone, SPCC produced 74% of Peru's total mine copper output. At Toquepala, 98,300 tons of blister copper was produced from mill grade of 0.91%; at Caujone, 159,450 tons of blister copper was produced from mill grade ore of 1.41%. SPCC employed 6,300 workers during 1977, an increase of 15%. SPCC's net sales during 1977 of $268 million were to Minero Perú Comercial (MINPECO)—42%, ASARCO Incorporated—12%, Billiton Metallurgie B.V.—11%, a Japanese group—10%, Marmon Group—5%, Phelps Dodge Refining Corp.—4%, and the Newmont Mining Corp.—2%.

Centromin Perú was Peru's second largest copper producer at 56,520 tons representing 17% of Peru's total mine output. Centromin Perú refined all of its blister production. In 1977, Centromin Perú reached a record high in output of refined copper of 41,772 tons, an increase of 18% at its metallurgical complex at La Oroya and continued planning to expand the capacity of the copper refinery from 58,000 tons per year to 73,000 tons per year. Centromin Perú obtained financing from the Inter-American Development Bank and the World Bank for its $161 million project to expand the copper mine and concentrator of Cobriza. Mine output at Cobriza is to be increased from 2,500 tons per day to 10,000 tons per day. An annual production of 203,000 tons of concentrate containing 26% copper is expected in March 1980 when the work is scheduled for completion. In March 1977, Centromin Perú entered into an agreement with Arthur McKee Inc. and Motlima del Peru for management services. By yearend, the basic engineering studies for Cobriza were almost completed, 1,600 meters of the total 5,000 meters of tunneling was completed, and construction was initiated on the 14-kilometer access road.

The new Aquila mine, owned by Mines Aquila S.A. and located at Huaraz in Sihuas Province, was scheduled to come on-stream in March 1978 with an annual production of 2,200 tons of copper. Concentrate from the mine was to be mixed with water, pumped across the continental divide, and trucked 100 miles to the port of Chimbote. The Aquila mine has measured and indicated reserves of 22 million tons of 1.4% copper, with inferred reserves of 45 million tons.

Table 5 provides a summary of the major copper deposits being planned for development by Minero Perú and Centromin Perú.

Digitized by Google

Table 5.—Peru: Large copper deposits planned for development

Deposit	Location	Owner	Reserves (million metric tons)	Ore grade (percent sulfides)	Cost (million dollars)	Annual production (metric tons)	Start-up date
Cerro Verde II-Phase I	Arequipa	Minero Perú	1,200	.64	250	60,000	1981
Tintaya	Espinar, Cuzco	do.	[1]50	2.0	182	50,000	1982
Michiquillay	Cajamarca	do.	544	.69	595	92,000	1985
Antamina	Huari, Ancash	do.	[2]100	2.6	590	89,200	1985
Quellaveco	Mariscal Nieto, Moquequa	do.	380	.85	300	65,000	1986
Toromocho	Morococha, Lima	Centromin Perú	400	.75	[3]1,200	83,600	1988

[1]In addition, Tintaya has 10 million tons of oxide ore with 2.2 copper.
[2]Ore also contains 3.1 zinc providing the basis for annual production of 66,200 tons of zinc, 1,490 tons of molybdenum concentrate, and 33.6 tons of silver.
[3]This estimated cost includes a smelter and refinery, necessary due to the antimony and arsenic content of the ore. However, the company is studying the possibility of developing this deposit in a first stage, at a capacity of 15,000 dry short tons per day, treating concentrates at the La Oroya smelter and refinery. Required investment for this first stage would be $190 million and the project would be in production by 1982.

The Ilo copper refinery, located on the Pacific coast west of the Toquepala and Cuajone mines, operated throughout 1977 and produced 123,400 tons of copper cathodes. In connection with expansion of the Ilo refinery from 150,000 to 300,000 tons per year, Minero Perú reached agreement with Mitsui Furukawa of Japan for the tankhouse and hospital, and with Maerz Ofenbau of Switzerland for the anode plant. Minero Perú was awaiting Government authorization to sign the contract.

Gold.—The Government was considering a draft law to encourage investment in gold mining in response to the surge in the gold price and possibilities of improving Peru's foreign exchange position. Several gold placer deposits in southeastern Peru were attracting interest. Minero Perú invited the domestic and foreign private sectors to participate in the exploitation of a well-known gold placer deposit called San Antonio de Poto in the Department of Puno. This deposit, worked by Natomas Co. of California between 1961 and 1972, has long been regarded as a promising prospect for increased gold production. Centromin Perú initiated extensive exploration in the same area. In 1977, the Banco Minero discovered a large gold placer deposit in the Alto Laberinto area on the left bank of the Madre de Dios River, about 65 kilometers west of Puerto Maldonado in southeastern Peru and another placer deposit at Huaypetue in the same Department.

The major part of Peru's current gold production came from placer deposits in streams on the eastern slopes of the Andes Mountains. Centromin Perú continued as Peru's largest gold producer from the metallurgical complex at La Oroya. Centromin Perú's gold output in 1977 in gold bars, concentrates, and blister copper was 36,941 troy ounces, respresenting 41% of Peru's total gold output. The Banco Minero purchased 38,260 troy ounces of gold from individual gold workers in the jungle, a 35% increase over the 1976 level. Minas Ocoña S.A., previously known as Andaray Gold Mines, operated the only lode gold mine in the Department of Arequipa. In operation for over 50 years, Minas Ocoña produces about 14,150 troy ounces each year.

Peru exported about 128,600 troy ounces of gold in 1977 valued at $18.5 million. The United States (40%) was the major importer, followed by the United Kingdom (24%), Switzerland (19%), and Venezuela (17%).

Iron Ore.— Hierro Perú, the only iron ore producer, achieved a strong rebound in output from its Marcona deposit in 1977 compared with the depressed level of 1976. The various forms of ore produced are given in the following tabulation, in metric tons. Exports of iron ore went mostly to Japan, the United States, and Korea.

	1976	1977
Iron ore pellets	2,339,340	2,531,570
Sinter feed	1,441,870	2,416,790
Pellet feed:		
Cake	501,950	508,290
Slurry	493,140	733,830
Total	4,776,300	6,190,480

Lead and Zinc.—Centromin Perú continued as Peru's major lead and zinc producer accounting for 48% and 47%, respectively, of the country's total. Thirteen other impor-

Digitized by Google

tant lead and zinc producers in 1977 are shown in Table 6. Centromin Perú proceeded with its $78 million project to rehabilitate and expand the zinc circuit at La Oroya from 70,000 to 90,000 tons per year. By yearend, 90% of the basic engineering and 30% of the detailed engineering had been completed.

Minero Perú's contract with Syndicat Belge d'Enterprise S.A. "SYBETRA" for construction of the new zinc refinery at Cajamarquilla, 35 kilometers east of port Callao, in Lima, became effective in August. During the year, construction was started on the railroad tunnel connecting Cajamarquilla with the main rail line. Foreign financing for the $203 million refinery was arranged as follows: SYBETRA-$60.4 million, Kreditanstalt für Wiederaufbau (KFW)-$36.4 million, Belgian Government-$4.1 million, Banco Exterior de España-$719,000, and suppliers's credits-$225,000.

Table 6.—Peru: Mine output of principal lead and zinc producers

(Metric tons of metal content)

Company	Lead		Zinc	
	1976	1977	1976	1977
Centromin Perú	64,412	79,300	198,399	188,720
Cia. Minera San Ignacio de Morococha	2,735	3,245	36,499	42,910
Cia. Minera Santa Luisa	10,399	11,112	24,389	29,556
Cie des Mines de Huaron S.A	10,366	9,725	25,708	25,600
Volcan Mines Co.	884	805	16,087	20,247
Cia. Minera Atacocha	15,976	16,614	18,266	19,190
Cia. Minera Milpo	10,751	9,485	17,200	17,780
Cia. de Minerales Santander	1,345	1,021	20,138	17,300
Cia. Minera Raura	10,345	9,485	11,606	12,480
Cia. Minera del Madrigal	5,050	6,052	9,430	10,575
Minas de Gran Bretaña	--	--	9,522	9,564
Cia. Minera Rio Pallanga	5,071	5,380	6,056	6,635
Cia. Minera Alianza S.A	4,302	6,215	3,754	5,985
Cia de Minas de Buenaventura S.A	5,930	6,020	2,976	3,270

Manganese.—Minas de Gran Bretaña, Peru's only manganese producer (and an important zinc producer), discontinued the production of manganese in 1976 with 613 tons of ore containing 27% manganese.

Molybdenum.—SPCC produced the major part of Peru's molybdenum concentrate as a byproduct of its copper operations at Toquepala. The remainder of Peru's output came primarily from Cia. Minera Turmalin a, which operated a small mine in Piura in northern Peru. In 1977, SPCC produced 861 tons of molybdenum concentrate, a 16% increase, with a MoS_2 content of 88%. Peru's output of molybdenite was expected to increase by 3,200 tons when SPCC receives authorization to install an annex to its Botiflaca concentrator at the Cuajone mine.

Silver.—In 1977, silver replaced zinc as Peru's second most important export in value, after copper. Peru ranked fifth as a world silver producer. Centromin Perú continued as Peru's leading silver producer at La Oroya, chiefly as a byproduct of its copper-lead-zinc operations. Cia. de Minas de Buenaventura S.A. was Peru's second largest silver producer, with an output of 410;000 troy ounces, mostly from its Orcopampa lead mine in the Department of Arequipa. Other important silver producers were Minas de Arcata S.A., Cia. des Mines de Huaron S.A., Cia. Minera Alianza, S.A., Cia. Minera Castrovirreyna S.A., and Northern Peru Mining Corp. Silver exports in 1977 totaled 42.5 million troy ounces, a 7% increase compared with the 1976 level. More than 50% of Peru's silver was imported by the United States, followed by Japan, the Netherlands, and Sweden.

Tungsten.—There were three tungsten producers in Peru. Production, in tons of WO_3, is given in the following tabulation:

Company	1976	1977
Centromin Perú	447.2	447.0
Malaga Santolalla	212.0	213.0
Turmalina	19.6	36.7
Total	678.8	696.7

Centromin Perú recovered tungsten from its Morococha and Mahr Tunnel units in central Peru, Neg. Minera Malaga Santolalla e Hijos from the old Pasto Bueno mine in Ancash Department, and Cia. Minera Turmalina from an operation in northern Peru.

Digitized by Google

NONMETALS

Barite.—Peru ranked third among the world's barite producers, behind the United States and the Soviet Union. Much of the production is destined for the gulf coast drilling mud market. Peru's major barite producer was Perubar S.A., a wholly owned subsidiary of NL Industries' Baroid Division. Perubar's Graciela mine in Huarochiri Province, east of Lima, has a current capacity of 300,000 tons per year of crude ore. A second producer, Minera Baribent S.A., produced 35,000 tons per year from its open pit operations in Junín. Drilling mud grade barite was also produced by Barmine S.A. from deposits in Huarochiri Province with a capacity of 50,000 tons per year. Filler and chemical grades of barite were produced at the Lima plant of Cia. Minera Agregados Calcareos S.A.

Cement.—Fuller Co. was contracted by Cementos del Norte Pacasmayo S.A. in Lima for equipment to increase production of its dry-process cement plant at Pacasmayo, located north of Trujillo. Capacity is to be increased from 1,000 to 3,000 tons per day with completion scheduled for the end of 1977.

Fertilizer Materials.—Pursuant to the "basis agreement" (acuerdo de bases) signed in December 1976, Empresa Nacional Adaro de Investigaciones Mineras S.A. (ENADIMSA) of Spain completed in 1977 the prefeasibility study to develop the Bayóvar phosphate deposit in northern Peru. Minero Perú expects to develop this deposit with private sector participation through a special mining company. The fertilizer petrochemical complex at Talara produced 118,000 tons of urea, representing 85% of its projected production for the year. Petroperú was studying the feasibility of constructing an ammonia-urea complex at Bayóvar.

Gypsum.—Cia. Minera Agregados Calcareos S.A., principally a cement producer, also mined a small amount of gypsum.

MINERAL FUELS

Coal.—During 1977, the combine of KOPEX of Poland and Universal Engineering of Switzerland was nearing completion of the Alto Chicama feasibility study to be delivered to Minero Perú in April 1978. The Alto Chicama coal project located in the Department of La Libertad is designed to generate electric power for the areas of Trujillo and Chimbote north of Lima on the Pacific coast. Minero Perú contracted with Boyles Bros. for a diamond drilling program to determine the extension of the coal seams. The results obtained indicate larger reserves of anthracite coal than the 60 million tons previously estimated.

In central Peru, Centromin Perú was involved in exploration of the Jatunhuasi coal deposit located in the region of La Oroya, 45 kilometers northwest of Huancayo. Preliminary results indicate the availability of high-grade bituminous coal. Centromin Perú was seeking coal of coking quality. The Jatunhuasi coal deposit was being explored under Special Rights, which is a program that reserved exclusively for development by the State.

Natural Gas.—Natural gas plays a small part in Peru's total energy situation, supplying about 4% of total energy demand. As in the case of crude oil, output of natural gas over the past decade has been nearly level after a peak of 77.1 billion cubic feet in 1969. In 1977, production of natural gas from the northwestern coastal field continued its descending trend, declining 6% to 32.3 billion cubic feet; however, output from the northern continental shelf continued its ascending trend, increasing 9% to 40.5 billion cubic feet. Almost half of the gas is liberated to the atmosphere.

Peru has a major gas field with estimated reserves of 530 billion cubic feet located in Aguaytia in the central Amazon jungle about 440 kilometers northeast of Lima and 39 kilometers west of Pucallpa. Petroperú's plans to revive the Aguaytia gas project is pending availability of financial resources. Peru's total gas reserves were estimated at 1.3 trillion cubic feet.

Petroleum.—The major petroleum event in 1977 was the arrival in May of crude oil at the Bayóvar terminal in northern Peru through the 853-kilometer trans-Andean oil pipeline completed in December 1976. The availability of crude oil on the Pacific coast made it possible for Peru by yearend to reduce imports of crude from 50,000 to 10,000 barrels per day. As a consequence, total imports of crude from Ecuador and Venezuela decreased 14% to 14.6 million barrels in 1977.

The startup of the pipeline also made it possible for Occidental Petroleum Corp. to barge its production from the Shiviyacu area down the Pastaza and Marañon Rivers to the jungle terminus of the pipeline at San Jose de Saramuro instead of shipping it to Brazil via the Amazon River. As a result, Peru's exports of crude oil to Brazil declined

Digitized by Google

sharply in 1977 to meet domestic demand. After 15 years of importing crude oil, Peru was expected to become self-sufficient during 1978 and to have a surplus to resume significant exports.

Construcciones Protexa S.A. of Mexico continued building the 253-kilometer northern spur pipeline connecting Occidental's oilfields in the Shiviyacu area near the Ecuadorean border to the trans-Andean pipeline.

After a decade when output was practically constant, production of crude petroleum in 1977 reached a historic high, 91,200 barrels per day, compared with 76,500 barrels per day in 1976. During 1978, output was expected to reach 175,000 barrels per day. Domestic consumption of crude oil in 1977 was estimated at 116,000 barrels per day, requiring a reduced level of imports.

As detailed in table 7, Peru's improved petroleum situation was due to the 154% increase in output from the jungle areas where a Government-owned company and Occidental were operating. Petroperú's output from its Trompeteros oilfield in the Amazon basin increased from 1.1 million barrels in 1976 to 6.5 million barrels in 1977; in the Shiviyacu area, Occidental increased oil output from 2.7 million barrels to 3.8 million barrels in the same period. Occidental's production was limited by storage capacity since the northern spur line connecting the Occidental oilfields with Station No. 5 of the trans-Andean pipeline near Borja was still under construction. When the spur line is completed in early 1978, Occidental is expected to raise its level of oil production by opening up the oilfields of Forestal, Capahuari Norte, Capahuari Sur, Huayuri and Tambo, all located around Shiviyacu. Occidental expected to produce over 80,000 barrels per day from these fields by the end of 1978.

Petroperú contracted Geopet Asociados S.R. Ltda., the first 100% Peruvian company involved in petroleum drilling, to drill seven development wells in the Maquia oilfield located in the central jungle area south of Pucallpa.

In May, the expansion of the La Pampilla oil refinery near Lima to 100,000 barrels per day was completed by Compagnie Française d' Études et de Construction (TECHNIP). Peru's new total refinery capacity of 168,000 barrels per day was expected to meet the country's fuel needs until 1982. The Pampilla expansion made it possible to shut down the 8,000-barrel-per-day Conchan refinery in June.

Fuel prices continued their ascending trend in 1977. The price of regular motor gasoline increased 50% to $0.93 per gallon and premium gasoline increased 38% to $1.36 per gallon. Prices of kerosine, diesel fuel, and residual fuel each increased about 30%.

Exploration activities decreased in 1977 due primarily to Petroperú's difficult financial condition. Petroperú drilled 8 exploratory wells compared with 14 in 1976 and 38 in 1975. In the Amazon basin, Occidental continued drilling in block 1-A, and by yearend had drilled a total of 44 wells, of which 39 were producers, in the 8 oilfields discovered to date.

In March, the Government published the terms to govern the new exploration/exploitation contracts for areas in the continental shelf and the jungle that were reopened in July 1976. In general, the new terms follow the 1970 Peruvian model; that is, the contractors are to be paid a percentage of the production and will cover all expenses during the exploration contract; but, contrary to the old Peruvian model, the production split is open to negotiation, depending on specific situations; contractors are not obliged to carry out the three phases (geologic and geophysical exploration, exploratory drilling, and production) of the contract; and all taxes are to be paid directly by the contractors. On the same date the Government issued specifications for secondary recovery operations in the northwestern area, which has been divided into two sections: (1) La Brea-Pariñas, where bidding was restricted to companies from the Latin American Free Trade Association (LAFTA) group, and (2) Lobitos/EL Alto/Los Organos, where there was no restriction. However, no new contracts were signed during the year, and very few companies demonstrated interest by the purchase of information from Petroperú.

At yearend, Peru's proven oil reserves were estimated at 750 million barrels. The total petroleum resource base is uncertain but falls within the range of 2 to 26 billion barrels.

The Mineral Industry of the Philippines

By K. P. Wang[1]

The Philippine economy showed a slight improvement in 1977, growing at a rate of just over 6%. The trade deficit was reduced to roughly $765 million[2] in 1977 from $1.06 billion in 1976; favorable capital flows lowered the impact of this deficit. Inflation was about 8% in 1977. At current prices, the Philippine gross national product (GNP) reached about $20.7 billion in 1977, compared with $17.7 billion (revised) in 1976. In terms of constant 1972 prices, the GNP was $10.5 billion in 1977 and $9.8 billion in 1976.

The mineral output value of the Philippines at about $720 million represented only 3.5% of the 1977 GNP. Value added for refined materials and metals was not included in the output value, although this figure is generally small for the Philippines. However, minerals continued to be very important in overall trade, constituting 17% of all exports. Three-fourths of Philippine mineral production went to foreign markets. Mineral fuels (mainly oil) alone represented one-fourth of all imports in 1977, and base metals accounted for another 7%.

Improved performance by the mineral industry was tempered by the fact that inventories were building up in nickel and chrome. Copper prices were improving, however, and the Philippines started to have problems delivering concentrates to foreign buyers. Increased gold prices did not lead to increased primary production, but byproduct gold production from copper registered a significant gain. Copper earnings were expected to improve as a result of successfully renegotiated reduced smelting charges conceded by the Japanese smelters. Chromite prices started to stabilize at yearend.

Various copper facilities were being readied to resume operations in late 1977, such as the 30,000-ton-per-day mill of Western Minolco Corp. and the 15,000-ton-per-day mill at Ino owned by Consolidated Mines Inc.[3] A number of other copper projects were already partially completed, including a 10,000-ton-per-day mill in Negros Oriental Province, owned by Construction & Development Corp. of the Philippines; a 10,000-ton-per-day mill in Davao Province on Mindanao Island, owned by Sabena Mining Corp.; a 30,000-ton-per-day plant in Negros Occidental Province called the Hinobaan project, owned by Lepanto Consolidated Mining Co.; and a 17,000-ton-per-day one-mill complex in Zambales Province called the Dizon project, owned by Benguet Consolidated Inc. Some old gold projects were being reexamined because of improved gold prices, including the Masbate project of Atlas Consolidated Mining & Development Corp. and the Surigao project of Manila Mining Corp. Conditions were not favorable for finding additional large chromite deposits. New nickel ventures were not likely to be implemented because of the price and technical difficulties associated with this metal.

Atlas, the country's best known mining company with principal operations on Cebu Island, grossed $177.5 million but netted only $10.8 million in 1977, compared with $157.7 million gross and $25.4 million net profits in 1976.[4] Atlas produced over 80,000 troy ounces of gold and nearly 129,000 tons of mine copper, although its new 32,000-ton-per-day open pit called Carmen had just started full-scale operations during 1977.

Philex Mining Corp., with a block-caving porphyry mine in the Baguio area, registered the highest profitability among Philippine mining companies, with a net profit

Digitized by Google

of $19 million derived from a $68.5 million gross revenue. Philex was the country's leading gold producer with 185,000 troy ounces in 1977 and the third largest copper producer with 33,567 tons of mine copper in 1977.

Benguet (mainly a gold producer) ranked fourth among Philippine mining companies in overall returns, with gross earnings of $66.9 million and a net income of $8 million in 1977 derived from over 100,000 troy ounces of gold output from mines in Baguio. This firm was entering the copper business with the Dizon project.

Marcopper Mining Corp., with mines in Marinduque Province, grossed $49.8 million in 1977 and cleared $6.6 million in profits. Marcopper was the country's second largest copper producer, with mine output of 47,236 tons in 1977, also producing 45,000 troy ounces of gold. Marcopper started to develop the San Antonio ore body under the tailings pond.

Lepanto grossed $35 million in 1977 and netted $4.65 million from its Mankayan mine near Baguio, which produced about 18,000 tons of mine copper and 75,000 troy ounces of gold. Lepanto was working on a roaster project to cut down on arsenic, and the smelter that treats its ore (ASARCO Incorporated's Tacoma smelter near Seattle) regained its operating permit.

Marinduque Mining & Industrial Corp., with copper mines at Sipalay (Negros Occidental Province) and Bagacay and nickel operations near Surigao, had a gross of $138 million in 1977 but incurred a loss of $11 million. The Sipalay mine made money but the nickel project more than lost it, forcing Marinduque to temporarily shut down Bagacay.

Consolidated Mines fared passably well with its chromite business. However, various small gold-copper companies incurred losses in 1977, especially Western Minolco but also Benguet Exploration Inc., Black Mountain Inc., and Itogon-Suyoc Mines Inc.

Certain developments affected all mining companies, whether primarily domestically capitalized or foreign investment oriented. Presidential Decree 1352 lifted the tax-free provisions for the importation of capital equipment for new mines granted under Presidential Decree 463 (Mineral Resources Development Decree of 1974); instead it imposed a 5% customs duty and a 5% internal revenue duty. However, Presidential Decree 1353, issued around the same time, allows accelerated deduction of exploration and development expenditures by mining companies, provided the amount does not exceed 25% of net income; this decree is the Government's reply to the mining industry's petition for an alternative to the percentage depletion allowance phased out starting in 1975.[5] The Government had not yet taken action on the pleas of the copper industry for tax and other relief, either on an individual firm or industry-wide basis.

Philippine Central Bank Circular No. 602 of early 1978 required all primary and secondary gold producers to sell their gold to the Bank for refining at its newly completed refinery. This decision produced uncertainty concerning pricing mechanisms, smelting and refining charges, and the ability of producers to stockpile and hedge gold as a commodity. In response to this development, Atlas announced indefinite postponement of the Masbate gold project.

Foreign enthusiasm for joint ventures in developing new mines was dampened by a Government ruling that total returns to a foreign investor from both service fees and return on equity shall not exceed 40% of the net proceeds of the operations. Fourteen international mining corporations attempting to negotiate service contracts for risk investments under Presidential Decree 463 had pulled out of the Philippines by late 1977. Of the five remaining companies, three were disapproved subsequently for exceeding the 40% guideline. Some industry sources felt that if these guidelines were strictly imposed, foreign risk capital in joint ventures for exploration and development of new deposits would in most cases not be forthcoming. The 5% customs duty and the 5% internal revenue aspect of Presidential Decree 1352 would greatly affect the Philippine Sinter Corp. plant (100% owned by Kawasaki Steel Corp. of Japan), which was to process Brazilian and Australian iron ores on Mindanao Island for shipment to Kawasaki's steelworks in Japan.

The Philippine energy supply is based mainly on foreign resources at present, primarily imported crude oil costing nearly $1 billion in 1977. Newly found offshore oil was expected to reduce foreign dependency somewhat. Little coal has been domestically produced or consumed. The Goverment expected to initially develop the capacity to produce 1 million tons per year and perhaps expand capacity to 4 million tons per year in the next decade. The Philippines possesses less than 3,500 megawatts of developed generating capacity, two-thirds thermal (mainly diesel) and one-third hydroelectric. Three hydroelectric projects were being developed. Surveys on uranium resources

Digitized by Google

began very recently, and one nuclear plant of 620-megawatt capacity was being built, although its future disposition was unclear. The Philippine Department of Energy, through the National Power Corp., made plans to develop about 1 million kilowatts of geothermal energy within a decade. Unconventional sources of energy, including that generated by solar and wind forces, were being investigated, but so far this research has involved only $1 million annually.

PRODUCTION

The overall mineral production value increased from about $595 million in 1976 to $720 million in 1977.[e] Base metals accounted for 62% of the total value of minerals produced, nonmetals including coal 26%, and precious metals 12%. The Philippines is known more for base metal and precious metal production than for nonmetal production. The Philippines is the largest copper producer in Asia, and copper was the country's single most important mineral, contributing 39% to the total mineral production value, followed by cement at 17%. The country has become a medium-size cement producer. Nickel, accounting for just under 17% of total mineral output value, was the country's second most important metal, ahead of gold at 11%. The Philippines is only a medium-size producer of gold by world standards. It is well known for chromite, particularly refractory chromite, which alone contributed 3% of the total mineral output value. Lead, zinc, and silver together provided just over 2%.

Despite depressed conditions, copper output established a record high, with Atlas and Lepanto providing the margin over the 1976 output. Nickel came into its own, although the smelter still had problems. Good prices and demand revived the chromite industry, although production still was considerably lower than the peak level of 1973. Beach sands operations stopped because export demand dwindled. Manganese output and exports rose sharply despite the downturn in world steel demand. The sluggish performance of the construction industry adversely affected the cement, limestone, sand and gravel, and miscellaneous construction materials industries.

TRADE

Total trade in 1977 was about $7.0 billion compared with $6.2 billion in 1976. The trade deficit was cut down from about $1.06 billion in 1976 to $765 million in 1977. Exports rose 21% to $3.1 billion, whereas imports rose less than 8% to $3.9 billion. The foremost import items were mineral fuels and machinery other than electrical, followed by transport equipment, base metals, electrical machinery, cereals, and chemicals. Japan and the United States were the leading trade partners.

Coconut products and sugar were ahead of minerals in importance as exports, with the United States and Japan again the leading trade partners. Philippine mineral exports continued to increase in value, however, rising from approximately $450 million in 1976 to $530 million in 1977. Copper, despite its depressed market, remained the leading mineral export and provided about 45% of mineral export earnings. Nickel and gold followed, furnishing a combined 24% of mineral export earnings.

COMMODITY REVIEW

METALS

Chromite.—As of October 1977, the number of chromite producers had increased to 16—10 producing metallurgical chrome (2 more getting ready) and 5 producing refractory chrome (1 more getting ready)—compared with 11 in 1976 and only 5 in 1975. Prices were good in 1977, and entrepreneurs in the Philippines felt that resumption of the U.S. embargo on Southern Rhodesian chrome would help the sale of Philippine chrome. Consolidated Mines, with 5 million to 6 million tons of refractory chrome reserves at its Cotó property in Zambales Province, recovered from the typhoon damage in 1976 and produced 395,400 tons of product, nearly 100,000 tons more than last year. The other four producers together produced less than 2% of Consolidated Mines' tonnage.

Acoje Mining Co., Inc., dominated the metallurgical chrome scene, although its contribution was only about two-thirds of the total. Acoje's output in 1977 at about 85,200 tons, a fraction more than in 1976, was roughly 12,000 tons less than in 1975. Acoje, with about 1.6 million tons of 22% grade reserves at its Zambales property, was in the process of expanding mill capacity from 800 tons to 1,200 tons of ore per day; despite high prices, its operating income declined from that of last year because of the lower grade of ore mined and milled. Golden Arrow Mining Co. replaced G. Lluch & Sons, Inc. (no longer listed as a producer in 1977) as the second-ranking metallurgical chrome producer in the Philippines, with an output of 11,440 tons in 1977 from its Silanguin plant in San Antonio, Zambales Province, from proven ore reserves on the order of 200,000 tons. Golden Arrow was expanding production slightly. Four less prominent metallurgical chrome producers were Velore Mining Corp., Misamis Exploration Corp., New Frontier Mines, and Inter-Continental, which each produced at one-third to one-half the rate of Golden Arrow.

Cobalt.—Late in 1977, Marinduque announced its intention to construct a $16 million cobalt refinery at its Surigao nickel facility near Nonoc Island, with financing from the Asia Development Bank.[7] In processing the mixed sulfide concentrates hitherto exported to Japan for extracting cobalt, the proposed 3,175-ton-per-year refinery would establish the Philippines as one of the world's foremost cobalt producers. Since the nickel facility has not yet attained design capacity, the cobalt contained in the mixed sulfide concentrates produced was only 1,084 tons in 1977.

Copper.—The Philippines ranked ninth in the world and first in Asia as a producer of mine copper. Its output, while far less than that of the top three (the United States, Chile, and the U.S.S.R.) and considerably smaller even than that of the next three (Canada, Zambia, and Zaire) was of the same magnitude as such producers as Peru, Poland, Australia, and the Republic of South Africa. Copper dominated the Philippine mineral economy, accounting for about 39% of the total mineral output value and 45% of the mineral export value. Copper retained its third-ranking position in

Digitized by Google

overall Philippine exports, after coconut products and sugar, and provided more than 10% of the country's foreign exchange in 1977. Production rose 13% over that of 1976, mainly as a result of the gains made by Atlas, through the development of the Carmen pit, and by Lepanto, which resumed operations at its Mankayan mine.

The copper industry was generally depressed, however, owing to poor demand and continued low world prices. This situation caused the temporary closure of some of the smaller producers such as Western Minolco's operation (shut down in November 1977), Acoje's Barlo project, Marinduque's Bagacay mine, Benguet's Wild Cat project, and a copper project owned by Benguet Exploration. Philippine copper production during the second half of 1977, by major producer, was as follows, in tons:

Producer	Concentrate	Copper content
Atlas Consolidated Mining & Development Corp	239,896	72,665
Baguio Gold Mining Co	11,883	2,548
Black Mountain Inc	6,012	1,553
Lepanto Consolidated Mining Co	25,584	9,076
Marcopper Mining Corp	82,460	23,309
Marinduque Mining & Industrial Corp.[1]	50,990	14,690
Philex Mining Corp	64,263	16,855
Western Minolco Corp	15,185	3,509

[1]The bulk is from Sipalay, which produced 45,924 tons of concentrate containing 13,849 tons of mine copper; the rest is from Bagacay.

Source: Philippine Bureau of Mines. Mineral News Service (Manila). September 1978, p. 16.

The Philippine copper smelter project will be built at Palompon and Isabel near Ormoc City in Leyte Province, where there is geothermal potential. The planned annual refined metal capacity was raised from 84,000 tons to 138,000 tons; the smelter is scheduled for operation by 1981-82. The Philippine Government was to own about 40% of the smelting corporation, which will be called Philippine Associated Smelting and Refining Corp. (PASAR). Private mining companies will hold the rest of the shares roughly in proportion to their production levels. There were 14 copper producers in 1976 and 12 by yearend 1977, with the 5 leading producers owning the bulk of the corporate shares. Arther G. McKee & Co. stayed on as project design engineer, and bids were being offered for the roughly 10 major components. In the past, most concentrates have gone to Japan for smelting. The depressed economy there forced the Japanese to raise toll charges. This, in turn, caused great financial hardship on Philippine copper firms which successfully renegotiated for reduced refining charges.

Atlas was again the largest Philippine copper producer, producing from three open pits (Frank, Biga, and Carmen) and one underground mine (Lutopan) on Cebu Island. Yearend 1977 milling capacity was rated at 100,000 tons of ore per day. The tonnage milled in 1977 was 29.75 million tons of 0.49% copper ore, from which 128,989 tons of mine copper, 80,144 troy ounces of gold, 408,000 troy ounces of silver, and 74,630 tons of pyrite were derived. Atlas' ore reserves at yearend stood at 971 million tons of 0.46% copper ore. The 32,000-ton-per-day Carmen pit came onstream 4 months ahead of schedule.

Marcopper, the country's second largest copper producer, produced at about the 1976 level from its Marinduque operations. Reserves were reduced to 68 million tons of porphyry ore after 9 million tons was milled. Marcopper's mine copper output was 47,236 tons in 1977. Construction work for the development of the San Antonio ore body, with 200 million tons of 0.40% to 0.57% copper ore, was started; 27 million tons of tailings and 16 million tons of overburden must first be removed, with production to commence by the early 1980's.

Philex, the third largest copper producer, was also the country's foremost gold producer for the second consecutive year. About 10 million tons of porphyry ore was extracted and milled at its block-caving operations at Baguio, yielding 33,567 tons of mine copper, 185,000 troy ounces of gold, and 312,000 troy ounces of silver in 1977. Philex's output rose over 9% during the year.

Marinduque had to temporarily shut down the Bagacay mine because of depressed copper prices and great difficulties in its nickel business. Marinduque's Sipalay mine carried on as usual, producing 27,130 tons of mine copper from 5.9 million tons of porphyry ore; reserves were about 650 million tons of relatively low-grade ore.

Lepanto, at one time the leader in gold production, staged a strong comeback in 1977 by resuming operations. Its enargite ore has long been a pollution hazard for the old Tacoma smelter which smelted the ore. About 58,000 tons of concentrates containing 18,000 tons of mine copper was extracted from 830,000 tons of 2.4% copper ore, together with 75,000 troy ounces of gold and 263,000 troy ounces of silver during 1977. Roughly 6.4 million tons still remained; relining the Tuba shaft will help to get at Lepanto's ores at lower levels.

Benguet, the well-known gold producer,

Digitized by Google

obtained finances for its $85 million, 17,000-ton-per-day Dizon copper-gold project, which should start operations by 1980.

Philippine copper concentrates are all exported, mostly to Japan. Of the 216,250 tons of mine copper exported by the Philippines in 1977, 77% went to Japan; an additional 6% went to the United States. Atlas' output went mainly to Mitsubishi Metal Corp. in Japan, Marcopper and Lepanto continued to ship to North America, Marinduque shipped to Mitsui Mining & Smelting Co., Ltd., and Philex regularly sends concentrates to smelters of Nippon Mining Co., Ltd. About 70,000 tons of Philippine copper concentrates was purchased by the Chinese for future delivery.

Gold.—Philippine gold production reversed its downward trend of the past few years and registered an increase of more than 10% over that of 1976. The gold price moved sharply upward, from $132 per troy ounce in the beginning of 1977 to about $165 at yearend. This prompted roughly a dozen firms to think about developing new gold mines in the next few years; however, the gold price subsequently declined somewhat, causing some prospective producers to reconsider. The Philippine Bureau of Mines was preparing to initiate a new gold mine development program at yearend, with a view toward evaluating potential gold deposits around the country and rendering technical assistance to claim holders on the condition of reimbursement if and when new properties are transformed into commercial operations. The Philippine Board of Investments started to grant incentives to serious investors capable of realizing an equity return of 15% based upon a gold price of $150 per troy ounce.

Atlas raised its monthly byproduct gold output from about 6,200 troy ounces in January 1977 to 10,300 troy ounces in January 1978. Its new Carmen open pit in Cebu Province began commercial operations in October 1977, adding considerable gold values to the gross. However, Atlas was not able to get cheap electricity from the National Power Corp. initially, and this was costly. Marcopper raised its monthly byproduct gold output at its Marinduque copper property from 3,300 troy ounces in January to 6,100 troy ounces in December; facilities had previously been expanded about 50%. The Philippines' leading gold producer, Philex, with its block-caving porphyry copper mine in Baguio, increased byproduct gold production slightly during 1977 under the stimulus of high prices. Benguet, by far the largest primary gold producer in the country, maintained steady output at its Baguio properties while working on deepening the mine and building a new long drainage tunnel; Benguet was also developing a new copper project in Zambales Province called Dizon. Lepanto had an erratic year after resuming production at its mine, also located at Baguio. Philippine gold output in 1977, totaling just under 560,000 troy ounces, included the following shares by leading producers: Philex 33%, Benguet 20%, Atlas 14%, Lepanto 13%, and Marcopper 8%.

The new gold refinery and mint of the Philippine Central Bank in Quezon City successfully completed its first test run in October 1977 and expected full-scale operations shortly. This refinery is rated at 600,000 troy ounces of gold and 450,000 troy ounces of silver per year. Provisions have been made to work on the byproduct gold expected to be recovered from the country's first copper smelter yet to be built. A Government monopoly on purchases of newly mined gold (including byproduct gold) was initiated with the proclamation by the Monetary Board of the Central Bank in early 1978 that local mining firms must deliver all their gold to the Bank's new gold refinery.[8] This monopoly also had the effect of discouraging some would-be miners from opening new gold mines. The Philippine Bureau of Mines would like to promote the establishment of a gold custom mill at Larap, Camarines Norte Province.

Iron Ore.—Iron ore production in the Philippines, which has consisted almost entirely of beach sands in recent years, was negligible in 1977. Filmag (Philippines) Inc., with operations in Ilocos Sur Province, was shut down for nearly a year because of alleged damage to beaches; by the time it was cleared for resumption of production in mid-1977, the Japanese became hesitant about buying the sand, thus leaving about 1 million tons of iron sand reserves still intact. Apex Mining Exploration Co.'s Gonzaga mine on Luzon Island was being readied to supply Japan with about 250,000 tons of iron sand annually for about 8 years. Inco Mining Corp.'s magnetite deposit in the Cagayan area of northern Luzon Island reportedly was also being developed for the Japanese market. About 100,000 tons of pyrite cinders has been produced annually, mainly by the copper companies.

A $250 million, 5-million-ton-per-year iron ore sintering plant was completed in spring of 1977 at the Phividec industrial estate in Villanueva, Misamis Oriental

Digitized by Google

Province, in the southern Philippines.[9] The plant belongs to Kawasaki of Japan, which designed it to supply sintered ore to its steelworks in Chiba, Japan. Kawasaki's wholly owned subsidiary Philippine Sinter Corp. runs the facility, which is located on the deepwater Macajalar Bay on the northern coast of Mindanao Island and uses high-grade iron ore from Brazil, Australia, and Canada, and limestone from a quarry in Bohol, central Philippines. Normally, sintered ore crumbles during long-haul shipment, but Kawasaki's new materials-handling technology has overcome this obstacle. Thus, for the first time in steelmaking history, a major producer is sintering 1 million tons of ore per year at an overseas location where power and labor costs are lower.

In late December 1977, Brazil reached an agreement with Kawasaki to use its port facilities at Villanueva on Mindanao Island to distribute Brazilian iron ore to steel mills in the Republic of Korea, the People's Republic of China, and Indonesia. This port can accommodate 250,000-deadweight-ton ore carriers and store 2 million tons of iron ore. Brazilian iron ore brought there by large carriers will then be transshipped by smaller vessels to various Far Eastern markets.

Iron and Steel.—As of fall of 1977, a final decision on the size of the proposed integrated steelworks had not been made. The Philippine Government was considering 2 million to 2.5 million tons per year of steel, and a Japanese mission suggested 1.5 million tons per year with facilities up to the billet and blooming mill stages. Costs no doubt would exceed $1 billion. The location would be Misamis Oriental Province on northern Mindanao Island near Kawasaki's iron ore sintering plant. It may be that the rolling facilities of National Steel Corp. (at Iligan) and of Elizalde Steel Consolidated Inc. (at Rizal) would be expanded to process semimanufactures from the proposed new works. Most of the iron and coal raw materials will have to be imported, and sintered ore probably can be obtained from Kawasaki's nearby plant in the future.

Marcelo Steel Corp. continued to do some pilot plant testing work on its direct-reduction project, even though it apparently had been shelved indefinitely.

Elizalde and National Steel are the main producers of steel products in the Philippines, and they process mostly imported semimanufactures and scrap. National Development Co. plans to build a 200,000-ton-per-year plate mill at Limay in Bataan Province for completion by 1980. Eventually, this project might be supplied by slabs from the proposed new integrated steelworks on Mindanao Island. The Philippines is consuming more than 1.5 million tons of steel products annually, and demand is rising.

Lead-Zinc.—The Philippine lead-zinc mining industry consisted of two primary producers, two unimportant secondary producers, and various prospects. Benguet, with its mine in the Baguio area, is better known for gold than zinc, but its 1977 zinc output of 5,150 tons of concentrates, valued at about $1.7 million, was worth nearly as much as the gold. The other important primary producer, Zambales Base Metals, Inc., produced about 15,000 tons of zinc concentrates during the year, along with nearly 6,300 tons of lead concentrates. Zambales produced all of the country's mine lead. Zambales sells to Japan exclusively, whereas Benguet sells exclusively to the United States. Zambales plans to raise mill capacity from 1,000 tons to 1,300 tons of ore per day, whereas Benguet planned to maintain its capacity. Zambales' reserves of 4% to 5% combined lead-zinc ores can support the proposed output for more than a decade, but Benguet's proven reserves found in small, high-grade veins or pockets are good for only 2 years, although new ore is generally uncovered as extraction progresses. A zinc prospect reported at Toledo, Cebu Province, may have 200,000 tons of 7% zinc ore.

Nickel.—The Surigao nickel refinery of Marinduque increased its production from 45% of design capacity in 1976 to 64% in 1977, which is just over 21,000 tons of contained nickel. The target for 1978 will be only about 22,680 tons of nickel, or 69% of capacity, because of the low price and sluggish world demand. This plant, using Sherritt Gordon's process, has been working the 1.2% nickel, 0.12% cobalt ore from nearby Nonoc Island, which is lower in grade and wetter than originally called for. In 1977, Marinduque obtained 87% of its $138 million revenue from nickel, the rest coming from copper and cement.[10] The company's loss was cut only slightly from that of 1976 because interest costs had risen from $14 million to $22 million in 1977, mainly for financing the $300 million nickel refinery investment. Atlas' proposed Freeport ammonia leach process project on Palawan Island was shelved indefinitely. However, a third project under Rio Tuba

Digitized by Google

Nickel Mining Corp. with a mine on Palawan Island started production in early 1977 and shipped its first ore to Japan in mid-1977. The Rio Tuba deposit has 13 million dry tons of reserves to support an annual design capacity of 700,000 tons of wet ore or 11,000 tons of contained nickel.[11] During 1977, Rio Tuba and another new mining operation owned by Infanta Minerals Corp. may have together produced about 15,000 tons of mine nickel.

NONMETALS

Cement.—The sluggish performance of the construction industry in 1977 affected the cement industry, causing a reduction in cement output of 1.6% in tonnage and 5.8% in value. The country's nearly-5-million-ton annual cement capacity was nearly 90% utilized in 1977, and output value was just under $120 million. About 15 cement producers were in the business, with Island Cement Co., Northern Cement Corp., Republic Cement Co., and Midland Cement Corp. among the largest. The Philippines has had large cement markets in roadbuilding and metropolitan construction programs. The export demand was down in 1977. Most limestone for cement manufacture was indigenous, as was the gypsum, which was derived mainly as a byproduct of the phosphate fertilizer industry.

Perlite.—The country's production of perlite has increased considerably in recent years, although output in 1977 was only 1,492 tons. Most of the crude perlite produced has gone to foreign markets, principally Taiwan, Thailand, Singapore, and Australia. However, production is expected to rise sharply in the near future because of sizable reserves and completion of the first "popping" plant in the Philippines. Located in Legaspi City, Albay Province, northwestern Philippines, this plant was being tested at yearend in anticipation of full-scale operations. Most perlite plants require at least a few thousand tons of crude perlite per year for expansion purposes. The Legaspi plant is managed by the U.S. firm Grefco International, although it is 60% Philippine-owned. The most important market for expanded perlite within the Philippines is in filtering; other potential uses include food processing, nickel extraction, beer brewing, lightweight aggregates, oil processing, horticulture, and cryogenic insulation.

MINERAL FUELS

Coal.—Coal exploration and development expenditures totaled over $70 million during 1976-77. Prospecting activities in the Philippines were stimulated by Presidential Decrees 972 and 1174 issued in conjunction with the Coal Development Act of 1976. Coal companies were urged to pool resources to enhance their technical capabilities prior to continuation of mining operations. The cost-recovery allowance was raised to 90% of the gross proceeds, thereby making it attractive for more intensive exploration and improving techniques. As a result, Philippine coal production more than doubled in 1 year, although still a mere 284,000 tons in 1977. Little coal is consumed in the Philippines, and any large demand in the future will probably have to be met by imports, particularly with regard to the high-quality coal needed in steelmaking.

The Department of Energy had contracted the consultant firm Robertson Research International Ltd. of the United Kingdom to evaluate Philippine coal resources, which are said to be 1 billion tons.[12] Particular attention has been focused upon recoverable tonnages. A report by Robertson Research mentions 14 known deposits, with the most promising areas located on Cebu and Semirara Islands and at Malangas (or Lalat and Lumbog). The Department of Energy took over the Uling project in central Cebu Province from the Philippine Bureau of Mines. By drilling 23 holes by yearend, commercially recoverable reserves here were already estimated at 2.5 million tons of Tertiary coal with structurally complex seams as thick as 4 meters. Philippine coal varies greatly in rank and is often low grade and limited in reserves. However, Department of Energy officials mentioned seams up to 30 feet thick and "more coal than we thought we had."

Petroleum.—Two modest discovery oil wells, South Nido and West Nido, were brought in offshore Palawan Island, with flow rates of 7,300 and 9,500 barrels of oil per day, respectively.[13] About half of the money spent for this project was Philippine money. The production-sharing ratio after costs in the Nido area is 60:40 in favor of the Government through the Philippine National Oil Co. (PNOC). The 40% will be shared by members of the consortium as follows: Cities Service Co. (as operator) 52.5%, Oriental Petroleum and Minerals Corp. 33.1%, Basic/Landoil 10.1%, and Philidrill 4.3%. The overall oil exploration expenditure in the Philippines during 1977 was about $92 million, at least 90% by foreign firms. The hope is to produce about 20,000 barrels per day initially. A rush job has been programmed for completion by spring

Digitized by Google

of 1979 for the Nido complex.[14] Total cost would be about $40 million, including five development wells for $14 million, a mooring system for $5 million, and production platforms for $4.2 million.

All Philippine oil requirements are presently met by imports, consisting predominantly of crude oil. The cost of oil imports climbed 5% to $952 million in 1977, and the quantity of oil imports rose 7%, reaching nearly 75 million barrels (just over 10 million tons).[15] Saudi Arabia provided the largest share of the crude oil (more than 26 million barrels), followed by Kuwait (13.3 million barrels), Indonesia (nearly 10 million barrels), Iraq (8.7 million barrels), the People's Republic of China (6.1 million barrels), and Iran (4.5 million barrels). The country now has four refineries with a total capacity of 277,000 barrels per day, and PNOC plans to build a new 110,000-barrel-per-day refinery in the next 2 years.

Uranium.—Philippine interest in uranium and nuclear energy started only recently. Plans were made to build two 620-megawatt nuclear plants at Morong, Bataan Province, west of Manila.[16] Westinghouse Electric Corp., the contractor, had already started construction of the first unit, but the second unit may be indefinitely delayed. Even the first unit was encountering serious problems related to spiraling costs and contract awards. Nevertheless, the effort to find uranium for this project got underway. In fact, the Philippine Bureau of Mines had embarked on a 3-year exploration program on behalf of the Philippine Atomic Energy Commission (PAEC). The Bureau was investigating Larap Peninsula, Camarines Norte and Camarines Sur Provinces on Luzon Island, and Zamboanga del Norte and Zamboanga del Sur Provinces on southern Mindanao Island. Subsequently, Philippine National Oil Exploration Co. and PAEC joined to start drilling at the Larap Peninsula mines, the Bagacay mines, and Magna Rosa.

The Mineral Industry of Poland

By Tatiana Karpinsky[1]

Poland is a country rich in raw materials. The most important raw materials mined in Poland are hard coal, brown coal, copper ore, lead-zinc ores, iron ore, sulfur, salt, stone, crude oil, and natural gas. Other mineral raw materials of lesser importance to Poland's economy are oil shale, precious and rare metals, and radioactive elements. Some of these metals are obtained as a byproduct of processing complex ores. The country also has reserves of gypsum, barite, kaolin, and other clays.

In 1977, the Polish mining industry produced over 500 million tons of raw materials (including major construction raw materials). Poland is self-sufficient in coal, copper, and sulfur, but the country continues to lack sufficient crude oil, natural gas, iron ore, phosphate, nickel, manganese, tungsten, and chrome resources.

The total value of Poland's gross industrial production in 1977 amounted to 2,702.4 billion zlotys (zl),[2 3] reflecting an increase of 8.6% over 1976 production. Among the country's branches of industry, the electrical and manufacturing industries are the most important. In 1977, they contributed 27.6% of Poland's total industrial output. The metallurgical industry contributed 8.8% of the total output, with ferrous metals contributing 5.7% and nonferrous metals contributing 3.1%. The fuel and power industry contributed 9.8% of the total output; the nonmetals industry contributed 3.5%, and the chemical industry contributed 9.1%.

Poland's economic policies changed in 1977. The emphasis was shifted from industrial expansion programs to programs aimed at improving the satisfaction of the people. More attention was given to production growth for the domestic and export markets. Although in 1975, more than 32% of the national income was allocated to investment projects, this figure dropped in 1977 to 27%. Work was focused on completion of projects already started. Approximately Zl588 billion was invested in Poland's socialized economy in 1977; this was 1.9% more than was invested in 1976. About Zl270.5 billion of this amount was invested in industry. Many new projects were completed, including the Zawiercies, Nowatko, and other steel plants, and extension of the Katowice steel plant. Development of the Rudna copper mine and beneficiation plant and construction of the Glogow 2 copper refinery continued in 1977. In the coal industry, new mines were under development (the Swierclany, Kaszyce, Ornontowice, and Suszec) and the first shaft in the new Lublin coal basin reached the first coal seam. At the Belchatow lignite strip mines, the first large rotary excavator was put into operation. Another excavator was put into operation in the Konin Basin.

Poland ranked 10th in total world industrial output and accounted for about 2.3% of the total world industrial production in 1977. According to Polish sources, the national income of Poland in 1977 increased

Digitized by Google

by 5.6%, slightly less than the target increase of 5.8%. Compared with production for 1976, the following production increases, in percent, were reported in 1977: Bituminous coal, 3.8; crude steel, 14.1; rolled steel products, 3.9; electrolytic copper, 13.5; and cement, 7.6. Electric energy production increased 4.8%.[4]

Goals of the Government's annual economic plan for 1977 were not met by the cement, electrical power, and fertilizer industries.

Exports in 1977 increased 11.2% over 1976 exports, falling short of the planned 13% increase. Imports increased 5.4%, but the trade deficit with countries that were not members of the Council for Mutual Economic Assistance (CMEA)[5] decreased. In 1977, there was a substantial increase in trade with the CMEA countries, compared with the previous year's trade.

In 1977, Poland continued to participate in bilateral and multilateral CMEA investment projects. Among the more important bilateral investment projects Poland was participating in were—

1) the sulfur mine at Tarnobrzeg, the copper mine at Lubin, and the Staszic coal mine in Upper Silesia, for which development credit was given by Czechoslovakia;

2) expansion of the Turnow I brown coal mine and development of the new Turnow II mine, for which credit came from the German Democratic Republic; and

3) the potassium mine in the U.S.S.R., for which credit came from Poland.

Participation in multilateral CMEA investment projects included production of asbestos and iron ore in the U.S.S.R. and construction of a 750-kilovolt high-voltage line from Vinnitsa, U.S.S.R. to the Hungarian border, the Orenburg gas pipeline (Soyuz), and the Polotsk oil pipeline. In exchange, it was agreed that Poland would receive additional supplies of asbestos, iron ore, ferrous alloys, crude oil, and natural gas over a period of 12 years, starting in 1979.[6]

Government Policies and Programs.—Poland's economy is centrally planned and controlled by the Government. The Ninth Plenary Session of the Polish United Workers' Party Central Committee accepted all the goals of the 5-Year Plan (1976-80), but decided to take more decisive actions toward improving economic efficiency and easing tensions that arose in certain areas of the economy. Changes were planned for the structure of investments, with emphasis on improving domestic market supplies and exports. No attempt was made to achieve the maximum pace of economic growth or to expand the national income, industrial production, construction, and other areas of the economy to the highest possible degree. For 1978, the annual plan foresees an increase in national income of 5.4% and an industrial output increase of 6.8%. Production of consumer goods, however, is forecast at a level 9.9% higher than production for 1977. In foreign trade, the plan envisages an increase in both exports (10.3%) and imports (3.9%). One of the prime conditions, however, for implementation of the 1978 plan is improved efficiency of the overall economic performance.

PRODUCTION

Coal is the most important fuel in Poland and accounted for 79% of the total primary energy needs in 1977. Extraction of hard coal exceeded 186 million tons, reflecting an increase of 6.9 million tons, compared with 1976 output. Coal output for 1977 placed Poland fourth among the world's coal producers, after the United States, the U.S.S.R., and Mainland China. The biggest contribution to coal production came from the Zabrze and Dobrowo mines. In 1977, there were 65 coal mines in Poland and 344,000 employees in the entire coal industry. The total number of mine workers was 305,000, of which 244,000 worked in underground mines. The share of coal output that was mechanically extracted reached 95% in 1977. The average daily output for a single mine was approximately 8,800 tons. In 1977, Zl25.6 billion was spent for the expansion of coal mines and 20% of that sum paid for the development of new mines.[7]

In 1977, development continued on the new Lublin coal basin, which is expected to supply mostly steam coal, with the first output planned in 1978. Lignite and brown coal production in 1977 increased by 1.5 million tons, compared with 1976, reaching 40.8 million tons. Output from the Turoszow Basin accounted for approximately 60% of the overall production of lignite in Poland. The lignite mines employed about 13,000 people. In 1977, development also continued on the 38-million-ton-per-year-capacity surface mining operation in the Belchatow region.

Digitized by Google

In 1977, the extraction of iron ore in Poland decreased by 2.2%, compared with the previous year, and totaled 659,000 tons. Iron content in the ore was approximately 30%. In addition, 16.9 million tons of iron ore and concentrates were imported. Crude steel production increased from 15.6 million tons in 1976 to 17.8 million tons in 1977. Output of rolled products increased 449,000 tons and steel pipes output increased 48,000 tons. The new Katowice metallurgical plant produced more than 1.6 million tons of pig iron, 1.8 million tons of crude steel, and 1.6 million tons of rolled, semifinished products.[8]

The most important achievement of the Katowice steel complex during the year was to put into operation a rolling mill, a middle-size rolling plant, and a second blast furnace.

Copper ore output increased by 1.3 million tons over 1976 output and reached 21.0 million tons. Development of the new copper mine Sieroszewice, with a projected capacity of 15 million tons of ore per year, was underway in 1977.

Production of electrolytic copper increased from 270,000 tons in 1976 to 306,600 tons in 1977. The planned target for installations—to reach an annual capacity of 320,000 tons of electrolytic copper—was not achieved because of delays in building the Glogow 2 plant. It is expected that production of electrolytic copper will reach 365,000 tons in 1978.

Poland is an important producer of zinc because the country has large deposits of zinc and lead ores. In 1977, Poland extracted 5.25 million tons of lead-zinc ore, reflecting an increase of 6.3% over 1976 output. A new mine, Pomorzany, produced about 750,000 tons of ore in 1977. Production of refined lead increased from 80,600 tons in 1976 to 85,400 in 1977 and refined zinc production decreased from 237,000 tons to 228,000 tons. Aluminum production increased slightly in 1977.

The production of 4.8 million tons of elemental sulfur in 1977 placed Poland second among the world's sulfur producers and made the country the biggest producer of sulfur in Europe. Poland's production of sulfuric acid has increased from 3.2 million tons in 1976 to 3.3 million tons in 1977. The largest plants producing sulfuric acid in Poland are situated in Tarnobrzeg at the fertilizer plants in Police and in Gdansk. Poland has reached a high standard in the design and construction of sulfuric acid plants.

Poland possesses rich deposits of rock salt. The most important salt mines and salines are at Inowroclaw, Klodowa, and Wapno. In 1977, production totaled about 4.4 million tons of salt, reflecting an increase of 0.5 million tons over 1976 production. In 1977, Poland processed about 16.5 million tons of crude oil, mainly at the refinery at Plock. Petroleum products were also produced by a considerably modernized plant at Blachovnia, and at the Gdansk refinery. The first stage of the Gdansk refinery was commissioned in 1976.

Natural gas production in Poland increased from 6.7 billion cubic meters in 1976 to 7.2 billion cubic meters in 1977. The use of natural gas in the chemical industry was increasing rapidly.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, antimony, cobalt, germanium, gold, a variety of crude nonmetallic construction materials, and carbon black are also produced; but available information is inadequate to make reliable estimates of output levels. Poland may also produce alumina in small quantities, but details of such an operation, if it exists, are not available.

[2]Includes content of multigradient fertilizers.

[3]Includes building gypsum, as well as an estimate for gypsum used in production of cement.

[4]Total of listed commodities only; excludes products not reported individually, as well as refinery fuel and losses.

TRADE

In 1977, Polish trade turnover (exports plus imports) amounted to Zl89.4 billion,[9] reflecting an 8.0% increase over that of 1976. The value of exports amounted to Zl40.8 billion and the value of imports was Zl48.6 billion. Total exports increased 11.2% (target increase was 13%) and imports increased 5.4% (2.7% target). The annual trade deficit decreased from Zl9.5 billion in 1976 to Zl7.8 billion in 1977. Trade for four main industrial groups in 1977 (in billion exchange zlotys) was as follows:

	1976	1977	Change, percent
Exports:			
Fuel and energy	6.61	6.67	+0.9
Metallurgy	2.30	2.45	+6.5
Electro-machinery	16.07	18.81	+17.1
Chemicals	3.15	3.51	+11.4
Imports:			
Fuel and energy	4.65	5.64	+21.3
Metallurgy	6.90	6.42	-7.0
Electro-machinery	19.46	20.04	+3.0
Chemicals	4.94	5.53	+11.9

Compared with 1976, the most significant mineral export increases (by tonnage) reported for 1977 were as follows (in whole numbers): Sulfur, 25%; copper, 22%; and brown coal, 10%. The following commodity exports decreased: Rolled steel products, 23%; petroleum products, 19%; and coke, 13%.

The most significant increases in 1977 mineral imports, compared with 1976 imports, were as follows: Manganese ore, 30%; crude oil, 9%; natural gas, 8%; iron ore, 7%; and alumina, 2%. Decreases in mineral imports were as follows: Rolled steel products, 27%; steel pipes, 8%, pig iron, 12%; and petroleum products, 22%.[10]

Trade with centrally planned economy countries in recent years has accounted for about 60% of total Polish foreign trade turnover.[11]

Digitized by Google

Poland's trade turnover with different country groups for 1977 is shown in the following tabulation:

Country group	Exports		Imports	
	Million zlotys	Percent	Million zlotys	Percent
CMEA and other[1] centrally planned economy countries	24,585	60	25,196	52
European Economic Community (EEC)[2]	7,416	18	11,606	24
European Free Trade Association (EFTA)[3] and other developed market economy countries	5,326	13	9,234	19
Developing countries	3,465	9	2,589	5
Total	40,792	100	48,625	100

[1]China, mainland, Yugoslavia, Vietnam, and North Korea.
[2]Comprises the following countries: Belgium-Luxembourg, Denmark, France, Federal Republic of Germany, Ireland, Italy, the Netherlands, and the United Kingdom.
[3]Comprises the following countries: Austria, Finland, Iceland, Norway, Portugal, Sweden, and Switzerland.

There was a substantial increase in Poland's trade with centrally planned economy countries in 1977. Exports increased 12.5% and imports 16.7% over those of 1976. The largest trade turnover was with the U.S.S.R. and was valued at 6.07 billion rubles (R), reflecting a 15.8% increase over the 1976 turnover. The value of Polish exports to the U.S.S.R. was estimated at R3.2 billion in 1977, including raw materials estimated at R0.6 billion. Total Polish imports from the U.S.S.R. amounted to R2.87 billion, including raw materials estimated at R0.2 billion.[12] Poland plans to reach R6.7 billion in trade with the U.S.S.R. in 1978.[13]

In 1977, the share of Polish imports provided by the Soviet Union was as follows: Crude oil, 77%; iron ore, 73%; pig iron, 80%; nickel, 100%; and aluminum, 62%. The U.S.S.R. has contracted to deliver to Poland in 1978 about 13 million tons of crude oil and 2 million tons of oil products, 6.5 million tons of iron ore in terms of iron content, and 2.8 billion cubic meters of gas; quantities of nonferrous metals, asbestos, and apatite are also contracted for delivery.[14] Polish deliveries to the U.S.S.R. are scheduled to include 100% of the Soviet Union's imports of coal, 99% of its sulfur imports, and 94% of its zinc imports. Polish exports to the U.S.S.R. also include tankers, container ships, hydraulic excavators, heavy bulldozers, mobile cranes, and complete plants, including sulfuric-acid plants. In addition, a number of new areas for joint Polish-Soviet cooperation and specialization were elected. They include production of equipment for nuclear powerplants, offshore drilling equipment, equipment for the iron and steel industry, mining machinery, and equipment for oil processing.

Polish officials expect that the deficit in trade with the U.S.S.R. in 1978 will not exceed R180 million.

Poland's other CMEA trading partners were (in descending order according to the amount of trade): The German Democratic Republic, Czechoslovakia, Hungary, Bulgaria, and Romania.

Poland's Government plans to establish a more active trade turnover with different countries in 1978. Government plans are for Poland to import from Yugoslavia machines, nonferrous metals, minerals, and chemicals, and for Poland to export to Yugoslavia complete plants, machines, manufactured products, coal, and chemicals. The Government expects a 30% greater turnover in 1978 than in 1977.

According to an agreement between Poland and Czechoslovakia, trade is to reach a value of about R1.4 billion in 1978. This is 13% more than was planned for 1977. Machinery and equipment are planned to account for about two-thirds of total trade between the two countries.

Under an agreement with Hungary, trade is to reach a value of R650 million in 1978, or about 11% more than was planned for 1977. Machinery and equipment are scheduled to be the principal trade items. Exports from Poland to Hungary are planned to include coal, coke, and semi-finished products. Poland plans to import from Hungary bauxite, alumina, and oil products. Other plans are for Poland to import from Albania chrome and iron ores and asphalt and for Poland to export to Albania manufactured products and chemicals. Poland's trade agreements are expected to increase exports of Polish coal, electrical energy, sulfur, copper, and industrial products to developed countries.

Digitized by Google

Poland's trade with the developing countries in 1977 was valued at about 7% of the country's total foreign trade. The bulk of Polish imports from the developing countries came from Morocco, India, and Brazil. The largest markets for Polish products in the developing countries were Brazil, India, and Libya. Together with Iraq and Iran, these countries receive about half of all the Polish exports that are directed to the developing countries. Since 1974, Poland has become an important supplier of coking coal to the Brazilian steel industry. A Polish-Brazilian agreement signed in 1975 provided for supplies of coking coal to Brazil and iron ore to Poland in the years up to 1985.[15]

COMMODITY REVIEW

METALS

Aluminum.—Production of aluminum in Poland totaled 104,000 tons in 1977, reflecting an increase of 1% over 1976 production. Poland imports all the alumina and bauxite required for its production of aluminum. In 1977, imports of alumina amounted to 286,000 tons. Imported alumina came from Hungary, Yugoslavia, France, the United States, and Guinea; and bauxite was imported from Hungary and Australia. Imports of aluminum and aluminum products came mainly from non-CMEA countries.

According to Polish sources, if domestic production continues to develop at the present rate, aluminum imports will soon cost more than Zl750 million. Plans are to reduce the cost of imports from the non-CMEA countries by about Zl250 million.[16]

The Skawina and Konin primary reduction plants are the principal aluminum production centers in Poland. Plans are to expand the Skawina aluminum plant, which presently has an annual capacity of 55,000 tons. The aluminum powder production section of this plant reached its full capacity in 1977; 400 tons of aluminum powder was produced. Plans are to increase aluminum production by approximately 40,000 tons in 1980. Methods for producing alumina from Polish non-bauxite raw materials are planned to be further developed, and the Nowiny aluminum plant is scheduled for expansion in 1978.

Cadmium.—Polish smelter production of cadmium is derived wholly from zinc ores of domestic origin. The average cadmium content of these ores is estimated at about 0.2%. The bulk of Poland's cadmium production is planned to go to export markets, principally the U.S.S.R. and the United Kingdom.

Copper.—Poland's most important natural resource among nonferrous metals is copper. In 1977, Poland produced 306,600 tons of electrolytic copper, 13.5% over that of 1976.[17] It is expected that in 1980 copper plants will deliver 425,000 tons of electrolytic copper and that Poland's share of world copper production will increase to 5%. In 1977, Poland exported 117,500 tons of copper. Copper was exported to the Federal Republic of Germany, the United Kingdom, France, Belgium-Luxembourg, and Czechoslovakia. Production of copper ores totaled 21.0 million tons in 1977, an increase of 1.3 million tons or 6.6% over 1976 production.

Copper ore deposits are located in the Legnica-Glogow region in southwestern Poland. These copper deposits lie 600 to 1,500 meters below the surface and consist of sulfide ores in relatively thin, flat, black bituminous shale. The average copper content is 1.5%, with about 1.0 troy ounce of silver per ton. Gross reserves of ores grading more than 1% copper are 1.5 billion tons. In 1977, copper ore was mined mainly from the three large undergroundmines Lubin, Polkowice, and Rudna in the Legnica-Glogow copper basin and also from the two smaller mines Konrad and Lena. Projected annual mine capacities are as follows: Lubin, 7 million tons of ore; Polkowice, 8 million tons; and Rudna, 15 million tons.

Poland's fourth largest mine, the Sieroszewice, located to the west of the Polkowice mine, with a projected capacity of about 15 million tons of copper ore per year, continued under development in 1977. In its first stage, the Sieroszewice mine is expected to produce 5.5 million tons of copper ore per year. This stage is expected to be developed in four years.

New installations were put into operation at the Lubin, Polkowice, and Rudna copper mines in 1977. The annual processing capacity at the Lubin concentrator has been increased by about 1 million tons of ore and capacity of the Polkowice concentrator has been increased by 2.7 million tons. At the Rudna mine, processing capacity increased by 1.25 million tons of ore per year. Expansion of the Rudna concentration plant was scheduled for completion in 1979, when the plant is expected to reach an estimated

Digitized by Google

capacity of 10 million tons of ore per year.

Two main smelters were in operation in 1977, one at Legnica, with a capacity of 90,000 tons of electrolytic copper per year, and one at Glogow, with a capacity of 160,000 tons per year. The new Glogow 2 copper plant was nearly completed with an anticipated capacity of 150,000 tons of electrolytic copper per year. Some 4,000 workers were employed on the project. The smelting plant was being built under Finnish license for smelting of concentrate with a capacity of 650,000 tons of copper concentrate per year. The first electrolytic copper from the Glogow 2 plant is expected to be produced in January 1978, with a total production of 150,000 tons per year in 1980. The Glogow 2 copper plant is planned to be fully automated and is to include a plant for the manufacture of sulfuric acid from the sulfur present in the copper ore. This plant is scheduled to go into operation in January 1978. The oxygen plant at the site of Glogow 2 produced its first oxygen in November 1977.

In 1977, Poland was seeking $350 million further credit to finance expansion of its copper industry. Development of the Sieroszewice mine and construction of smelting facilities are estimated at $1 billion. A western bank consortium was arranging a $250 million medium-term Euro credit for Poland to finance procurement of equipment and services for expansion of its copper industry. The final loan agreement was expected to be signed in January 1978.

Iron and Steel.—Poland's domestic output of iron ore is not large and only partly meets the needs of the Polish industry. In 1977, Poland produced 659,000 tons of iron ore; this production reflected a decrease of 2.2% from the 1976 level and a decrease of 74.2% from the 1970 level. Iron ore was extracted in Poland from seven mines located in the Czestochowa district and the Leczyca district.

The Polish steel industry is dependent upon imported iron ore; the country purchased 16.9 million tons of ore in 1977. Imports of iron ore and concentrates increased by 1.1 million tons in 1977 or 7% over 1976 imports. Iron ore was imported from the U.S.S.R., Sweden, and Brazil. Poland has a great shortage of ore-handling facilities. In 1977, a modern ore-handling base was under construction in North Port. Part of the base is expected to be completed and in use by the end of 1979. The ore base is planned to include a large storehouse that will make it possible to store an adequate amount of ore in the port.[18]

Geological investigations in Poland have proven the existence of new iron ore deposits in the northeastern part of the country, where several hundred million tons of iron ore were identified at a considerable depth. Development of these deposits is planned to start in the near future.

In 1977, Poland produced 17.8 million tons of crude steel, reflecting an increase of 14.1% over production in 1976. In 1978, steel production in Poland is expected to reach 19 million tons and in 1980 about 22 million tons of production is anticipated. The annual percent increase in Polish crude steel production for each of the following years, compared with production for the previous year, was as follows: 1972, 5.8; 1973, 4.3; 1974, 3.6; 1975, 3.0; and 1976, 4.2.

Output of rolled steel products reached 11.95 million tons in 1977; this was 3.9% higher than 1976 output. Output of steel pipes reached 1.18 million tons, which was 4.2% higher than 1976 output.

Imports of pig iron decreased from 1.97 million tons in 1976 to 1.74 million tons in 1977[19] and imports of rolled steel and pipes decreased from 2.34 million tons to 1.78 million tons. These decreases were a result of the start of operations at the new Katowice metallurgical plant. About 1.1 million tons of rolled steel products were exported in 1977; this amount was 300,000 tons less than was exported in 1976.

There were 27 Polish steel plants in operation in 1977, and most of them were located in the Upper Silesian Industrial District. In 1977, Poland ranked ninth in world crude steel production. The growth rate for steel production in Poland is faster than the world average. The two largest metallurgical plants in Poland are the Lenin and the new Katowice complexes. In 1977, the Lenin steel plant produced about 6 million tons of crude steel and the Katowice metallurgical plant produced about 1.8 million tons. Over the period 1971-76, Poland invested approximately Zl121 billion in development of its steel industry. This was about 20% more than was invested for that purpose in the preceding 20 years.

In 1977, the Nowatko and Zawiercie metallurgical plants, and a number of sections in other steel plants, were renovated and enlarged. The plate mill of the Boleslaw Bierut works at Czestochowa was commissioned, and its production of heavy plate for shipbuilding was expected to reach 1.43

Digitized by Google

million tons in 1978. At the Lenin steel plant at Krakow, renovation of the No. 3 blast furnace, built 20 years ago, was in progress. In December 1977, operations began at the Katowice metallurgical complex's second blast furnace, semifinishing rolling mill, and medium section rolling mill. Construction of the third oxygen converter and heavy section rolling mill, with projected capacity of 1.2 million tons of rolled steel per year, is planned to be completed in 1978.

In 1980, the total output of the Katowice metallurgical complex is expected to reach a capacity of 4.4 million tons of pig iron, 4.5 million tons of steel ingots, 4.2 million tons of semifinished sections, and 2.9 million tons of finished products. The projected capacity of 9 million tons of crude steel per year at the Katowice complex is expected to be reached after 1982.[20]

Construction of the new wide-gage railway from the Soviet-Polish border to the Katowice steelplant was underway in 1977.[21] It is expected that the line will be completed in 1980. It is anticipated that some 16 million tons of Soviet ore will be transported each year to the Katowice plant and that Poland will transport about 7 million tons of sulfur per year to the Soviet Union.

Lead and Zinc.—In 1977, Poland produced 5.25 million tons of lead-zinc ores; this output was 6.3% higher than the 1976 output. Lead-zinc ore extraction in Poland had previously increased from 2.5 million tons in 1960 to 4.6 million tons in 1975 and to 4.9 million tons in 1976.

Zinc and lead mining is concentrated in the Katowice area, where three major mines (Boleslaw, Olkusz, and Pomorzany) were in operation in 1977. The Pomorzany underground mine, with a capacity of 4 million tons of ore per year, started production of lead-zinc ore in 1974. In 1977, this mine produced some 750,000 tons of ore.

In 1977, Poland produced 228,000 tons of refined zinc and 85,400 tons of refined lead. Poland accounted for about 4% of the world refined zinc output.[22] Production of zinc decreased 3.8% compared with the 1976 level and production of lead increased 6.0%.

Zinc production is expected to increase to 260,000 tons in 1980, and lead production is projected at 120,000 tons. Exports of zinc and rolled-zinc products increased from 61,605 tons in 1976 to 61,964 tons in 1977. Nearly 60% of these zinc exports went to CMEA countries. The U.S.S.R., Czechoslovakia, and Hungary were the largest importers of Polish zinc. The chief importers among market economy countries were the United Kingdom, Austria, and Norway.

Several lead-zinc mines and smelters have been renovated in Poland. A new Imperial Smelting Furnace—Poland's second such furnace—is scheduled to come onstream at Huta Cynku in 1978. This furnace is planned to renovate the Miosteczko Slaskie plant in Upper Silesia. In addition, the new Pomorzany mine is expected to increase production of lead-zinc ores in the future.

Nickel.—Nickel was recovered in the processing of copper ore as well as from domestic low-grade silicate nickel ores. Poland's production of nickel is used by Polish steel plants, but the bulk of the nickel used in Poland comes from the Soviet Union.

Silver.—The largest share of Poland's total mine production of silver was produced as a byproduct of copper from the Legnice-Glogow region, about 65 kilometers northwest of Wroclaw. Ores from these deposits reportedly yield an average of one ounce of silver per ton. Polish sources indicate that in 1977, the sale of copper byproducts, principally silver, produced enough revenue to cover more than 100% of the direct mining costs at Legnice-Glogow. The balance of the Polish mine output of silver is derived as a byproduct of lead-zinc mining.

NONMETALS

Cement.—Cement output increased from 19.8 million tons in 1976 to 21.3 million tons in 1977. Production of cement is planned to increase to 23.8 million tons in 1978 and to reach 28.6 million tons in 1980. The amount of cement manufactured could not fully satisfy Polish demand and consequently had to be supplemented with imports.

There were 26 cement plants with 109 kilns in operation in Poland in 1977. Of these kilns, all except seven were rotary kilns.

In May 1976, a cement plant at Strzelce in the Opole area was commissioned. It produced 2 million tons of cement from that date to December 1977. The plant's planned capacity is 1.6 million tons of cement per year.

In 1977, two cement plants (one at Gorazdze and another one at Ozarow) were commissioned.[23] The Gorazdze cement plant produced 1.3 million tons of cement in 1977, and is expected to produce 2.4 million tons in 1978.

Digitized by Google

Fertilizer Materials.—Poland produces nitrogenous and phosphatic fertilizers, but potassic fertilizers are imported, mainly from the German Democratic Republic. Production capacity of Poland's nitrogen and phosphorous fertilizer industries increases far more slowly than the needs of agriculture. To improve this situation, exports of nitrogenous fertilizers are planned to be decreased and increased imports of phosphatic fertilizers are planned.

In 1977, Poland produced 1,520,000 tons of nitrogenous fertilizers and 965,600 tons of phosphatic fertilizers (both amounts are in terms of nutrient content). Production of nitrogen fertilizers decreased by 28,000 tons, and production of phosphatic fertilizer increased by 37,600 tons, compared with the 1976 levels. Imports of phosphorite and apatite concentrates amounted to 3.6 million tons and imports of potash fertilizers amounted to 3 million tons (in terms of nutrient content).

Over one-half of the output of nitrogenous fertilizers was supplied by the nitrogen plant in Pulawy. Large plants are also located in Wloclawek, Tarnow, and Kedzierzyn. By the end of the current 5-year plan (1978-80), the production of carbamide is expected to increase at the Pulawy nitrogen plant by 75,000 tons per year and at the Kedzierzyn nitrogen plant by 92,000 tons per year.

Also by 1980, a new carbamide installation with a capacity of 300,000 tons per year is planned to be constructed at the Wloclawek nitrogen plant. In addition, a new ammonia production unit is planned to be built at Pulawy and production is scheduled to be increased at existing ammonia installations at Kedzierzyn and Tarnow.[24] Plants producing phosphatic fertilizers have been built in Tarnobrzeg, Police, Lubon, and Cracow. By 1980, powdered superphosphate installations are scheduled for expansion, and production of triple superphosphate is expected to begin at the Szezecin, Wroclaw, Ubocz, and Tarnobrzeg plants. The Police II fertilizer plant, which is being built under a Polish-French agreement at a cost of Zl38 billion,[25] is expected to begin producing ammonia in 1980. This complex is expected to produce 500,000 tons of ammonia annually, 400,000 tons of urea, and more than 800,000 tons of nitrogen-phosphorous-potassium (NPK) fertilizer.

Gypsum.—One of the richest European deposits of gypsum is located in Poland's Nida Valley. This deposit is exploited by the Dolina Nidy mining-processing complex near Pinczow. Polish exports of gypsum total as much as several hundred thousand tons per year. Main importers are Sweden, Denmark, Norway, Finland, and Hungary.

Salt.—The total Polish output of salt amounted to 4.4 million tons in 1977, compared with an output of 3.8 million tons in 1976. The output of rock salt decreased from 1.7 million tons in 1976 to 1.6 million tons in 1977. Some 0.25 million tons of salt were exported in 1977, about half to Western Europe. The rock salt deposits occur along the Carpathian Foreland and in the central part of Poland, near Inowroclaw, Klodawa, and Wapno. In 1977, there were 11 salt mines and plants in Poland, with a total of 4,800 employees.

Poland's total salt reserves amounted to 43.5 billion tons; more than 60% of these reserves are in the Klodawa and Inowroclaw salt regions. The Klodawa mines in central Poland are the country's leading producers of rock salt. The salt near Klodawa and Inowroclaw occurs in the form of large salt domes and is extracted by underground mining and by underground leaching.

Poland's largest salt mine, at Szklodowa in the Klodawa region, extracted 1.2 million tons of salt in 1976; some 460,000 tons of salt was extracted at the Wapno mine (Pila Province).

In 1977, the first brine was pumped out of a new shaft at the Gora mine near Inowroclaw from a depth of 1,200 meters.

Development of the third mine in the Kujawy region started in December 1977 near Mogino. Plans are to pump brine from a depth of 1,400 meters for pipeline transport to the Kujawy-Mozovia chemical works.

In the Carpathian Foreland, the rock salt deposits at Bochnia and Wieliczka, near Tarnow and at Zory in the Rybnik coal region are of less commercial value than salt from the Klodawa, Inowroclaw, and Kujawy regions. A part of the Wieliczka deposit is extracted by underground leaching. The salt mine at Wieliczka is better known as a tourist center than as a commercially valuable mine.

Sulfur.—Poland is a large producer of sulfur. Total production of sulfur was 5.2 million tons in 1977, about the same as in 1976. Sulfur deposits in the Tarnobrzeg basin are the principal contributers to current production.

The largest part of 1977 sulfur production

Digitized by Google

came from the Jeziorko mine (2.9 million tons) and the Grzybow mine (1.4 million tons), where sulfur was produced by the Frasch process. The Jeziorko mine near Tarnobrzeg is scheduled to produce 3.2 million tons of sulfur in 1978.

Exports of sulfur reached 4.4 million tons in 1977, reflecting an increase of 25% over 1976 exports. Yugoslavia, China, and the CMEA countries imported over half of Poland's sulfur exports. According to Polish sources, the new mine situated at Smolinka in Przemysl Province has produced 6,000 tons of sulfur since it went into operation in September 1977.

Table 4.—Poland: Supply and apparent consumption of fuels and power

(Million tons of standard coal equivalent[1])

	Total primary energy	Coal (lignite, bituminous) and coke	Crude oil and petroleum products	Natural gas	Other
1976:					
Production	203.7	191.1	0.6	8.9	3.1
Imports	31.6	1.1	27.1	3.4	--
Exports	46.8	42.7	4.1	--	--
Apparent consumption	188.5	149.5	23.6	12.3	3.1
1977:					
Production	211.8	198.3	.7	9.6	3.2
Imports	32.5	1.1	28.0	3.4	--
Exports	46.1	42.8	3.3	--	--
Apparent consumption	198.2	156.6	25.4	13.0	3.2

[1]1 ton standard coal equivalent (SCE)=7,000,000 kilocalories. Conversion factors used are from the United Nations as follows: Hard coal, 1.0; brown coal, 0.3; coke, 0.9; crude oil, 1.47; petroleum products, 1.54; and natural gas (per thousand cubic meters), 1.33.

MINERAL FUELS

In 1977, Poland's total primary energy production was 211.8 million tons standard coal equivalent (SCE), reflecting an increase of 8.1 million tons over that of 1976. Coal (lignite and bituminous) contributed 93.7% of this total, petroleum contributed 0.3%, natural gas contributed 4.5%, and others (peat, wood, and hydropower) accounted for 1.5% of the total. Total consumption of all types of primary energy reached 198.2 million tons SCE. Shares of total consumption were coal, 79%; petroleum, 12.8%; natural gas, 6.6%; and hydropower, peat, and wood, about 1.6%. In 1977, the total consumption of primary energy increased 5.2% over consumption in 1976. The total energy balance for 1976 and 1977 is shown in table 4.

The Lake Zarnowieckie nuclear powerplant, which is under construction with Soviet assistance, is scheduled to start operations after 1984. In 1990, nuclear power is expected to contribute 13% of the total electrical energy generated in Poland.

Coal.—The coal mining industry has been an important basis for Poland's economic development. In 1977, bituminous coal production reached 186.2 million tons, or about 6.9 million tons more than in 1976.[26] Production of bituminous coal is planned to reach 192 million tons in 1978, 210 million tons in 1980, and 240 million tons in 1985.

Poland is the second largest exporter of coal in the world after the United States. In 1977, Poland exported 39.3 million tons of bituminous coal, or 0.4 million tons more than in 1976. Coal exports accounted for 21.1% of Polish bituminous coal output and 15% of the total value of Polish official total exports. In 1977, approximately 63% of the nation's coal exports went to non-CMEA countries. The largest importers in this group were France, Italy, Denmark, the Federal Republic of Germany, and Belgium-Luxembourg. The remaining 37% of Poland's coal exports went to CMEA-countries. The Soviet Union accounted for 65% of the total Polish coal exports to CMEA countries. Smaller amounts of coal were exported to Czechoslovakia, the German Democratic Republic, Romania, Hungary, and Bulgaria. In 1977, coal exports to the non-CMEA countries accounted for the growth of Poland's coal exports. Further growth of coal exports is anticipated. Brown coal production increased from 39.3 million tons in 1976 to 40.8 million tons in 1977, reflecting an increase of 3.8% that made it possible for Poland to export 3.4 million tons of brown coal, mainly to the German Democratic Republic.

Production of coke reached 19.9 million tons in 1977; this was 5.9% higher than production in 1976. Coke exports decreased from 3.11 million tons in 1976 to 2.72

Digitized by Google

million tons in 1977.[27] Coke was exported mainly to the Soviet Union and the German Democratic Republic. Among the non-CMEA countries, the largest importers of Polish coke were Austria, Switzerland, and Finland.

Poland's coal deposits are located in three basins: Upper Silesia (about 75% of all deposits), Lower Silesia (0.5%), and Lublin (24.5%). Coal is mined in Upper Silesia, mainly in the Rybnik coalfield around Katowice. Lignite is mined mainly in the Turoszow district in the Wroclow region and in Konin in the Poznan region.

All hard coal in Poland is mined underground at depths to 600 meters. The average depth is 450 meters. Coal seam thickness varies from 0.8 to 20 meters.

The caloric value of the Upper Silesian coals ranges from 4,800 to 7,800 kilocalories per kilogram. Polish coals tend to be highly volatile. The following quality ranges are indicated for Polish coals: Volatile matter, 20% to 32%; moisture content, 1% to 25%; ash content, 22% to 40%; carbon content, 72% to 90%; and sulfur content, 1% to 3%.

In 1977, development of the Swierclany, Suszec, and Kaczyce mines in the Rybnik basin continued. The Swierclany mine, with a designed capacity of 12,000 tons per day, is expected to produce 8,000 tons of coal per day in 1979. Coal production from a new mine at Suszec is scheduled to begin in 1982. Development of the Halemba mine at Rudna Slaska, which is planned to be the deepest mine in the Polish coal industry, was in progress in 1977. In September 1977, the Grunwald-3 shaft at the Halemba mine reached a depth of more than 1,100 meters, and the Grunwald-4 shaft was also under development. Halemba's daily rate of coal extraction is expected to increase from 14,000 tons to 24,000 tons.

Share of total coal consumption by various sectors in 1977 was as follows: Coke-oven plants, 17%; powerplants, 30%; miscellaneous industries, 30%; transport, 4%; and public utilities, 19%.

In 1977, the first coal seam was reached in the Bogdanka mine in the new Lublin coal basin in East Poland. In 1990, the Lublin basin is expected to produce 16 million tons of coal and increase in 1995 to about 24 million. Coal mines in the Lublin basin are being designed for an output of about 24,000 tons per day. The coal from the Lublin basin is of good quality, with an average value of more than 6,000 calories per kilogram. Total reserves of coal in the Lublin region are estimated at 40,000 million tons.

One of the largest lignite coal mining projects is Belchatow in the central part of Poland. In 1977, the first rotary excavator, with a capacity of 100,000 cubic meters per 24 hours, was put into operation at the Belchatow lignite strip mine. The first million tons of lignite is planned to be produced in 1980. The complete project is scheduled to come onstream in 1985. The major lignite mining project development at Belchatow has a target production capacity of 38 million tons per year. Reserves at the Belchatow basin amounted to 2 billion tons.

According to the development plan, about 15% of the country's total power will be produced at the Belchatow lignite mining and power complex in 1985. In 1977, 30% of Poland's total domestic power production was fueled by lignite.

The total handling capacity of the coal base in North Port amounted to 7 million tons per year in 1977. Plans are to expand the coal base in North Port between 1981 and 1990. The old port at Gdansk has a coal handling capacity of 4.2 million tons per year. Total cargo-handling capacity of all Polish ports is expected to rise from 59 million tons per year to 75 million tons in 1980.[28]

A project for coal gasification involving the Krupp-Koppers Co. of Essen is expected to be completed in 1982.

Construction of an 80-kilometer, 22-inch-diameter pilot coal-slurry pipeline is planned to start in 1978. Poland is seeking assistance and agreements for cooperation from U.S. firms for construction of coal-slurry pipelines and expansion of coal exports.

Natural Gas.—Extraction of natural gas in 1977 totaled 7.2 billion cubic meters; this was 7.0% more than was extracted in 1976. Most of the indigenous natural gas was extracted from the Carpathian Foreland.

Poland imported 2,759 million cubic meters of gas from the U.S.S.R. Deliveries of natural gas are planned to increase by 2.8 billion cubic meters after completion of the Soyuz pipeline.[29] The first deliveries of natural gas from the Soviet city of Orenburg are expected in October 1978. Under a 20-year agreement, Poland is to receive 2.8 billion cubic meters of natural gas per year in return for its investment in construction of the Soyuz gas pipeline.

Petroleum.—Crude oil is produced in Poland in small quantities. In 1977, output of crude oil amounted to 364,000 tons. Imports of crude oil reached 16.4 million tons, or 1.3 million tons more than was imported in 1976. 1977 imports of petroleum products amounted to 2.5 million tons.

In 1977, Poland's refineries produced

Digitized by Google

approximately 16.5 million tons of petroleum products, reflecting an increase of 6.2% over 1976 production. Under a contract signed between Poland and the Soviet Union, about 12.7 million tons of crude oil and 2.0 million tons of petroleum products are to be imported in 1978.[30]

Imports of crude oil from Arab countries are scheduled to increase considerably in 1978. The CMEA countries—including Poland—are expected to pay 20% more than they paid in 1977 for oil imported from the Soviet Union.

Poland exported 2.2 million tons of petroleum products and synthetic fuels, a total that is 0.5 million tons less than was exported in 1976.

The Plock refinery processed about three-quarters of the oil imported by Poland, or nearly 12.3 million tons. The Gdansk refinery has almost attained its designed capacity of 3 million tons per year. The Gdansk refinery is expected to export 820,000 tons of petroleum products in 1980, mostly to the Scandinavian countries.

Construction of a new refinery at Blachownia, near Kedzierzya-Kozle in Opole Province, with an initial capacity of 3 million tons per year, continued in 1977. This refinery is scheduled to go into operation in 1980.

About 40% of Poland's crude oil reserves occur in Poland's Lowlands, some 40% are in the Carpathian Mountains, and about 20% are in the Carpathian foothills.[31]

In October 1977, Polish workers completed a 440-kilometer Soviet crude oil pipeline. It extends from Polotsk in Byelorussia westward across southern Latvia and into Lithuania through Bizhay to the town of Mazejeikial, about 90 kilometers from the Baltic Coast. For its assistance in construction of the Polotsk line, Poland is promised an extra 1 million tons of Soviet crude oil per year at CMEA prices.

Poland, the Soviet Union, and the German Democratic Republic have signed an agreement to carry out geological prospecting for oil in the Baltic Sea on the Polish Shelf. An extensive geophysical research has convinced the Governments of the three countries that oil exists in the offshore Baltic waters shared by these three countries. The company is named the Petrobaltic and is located at Gdansk, where the first offshore test well is planned to be sunk.

The Mineral Industry of Portugal

By Roman V. Sondermayer[1]

During 1977, Portugal remained a modest producer of minerals and related products by world standards. However, its tungsten output accounted for about 4% of world production. Production of coal, tin, tungsten, pyrite, gold, copper, iron and steel, beryl, feldspar, uranium, and cement was of only domestic significance.

The gross national product (GNP) was $16.6 billion in 1977. Inflation was at an annual rate of 30%. The mineral industry, including processing, accounted for about 5% of the GNP and employed about 3% of the total labor force.

During 1977, plans were afoot to develop the Moncorvo iron ore deposits in northern Portugal and to increase mine output of pyrite and nonferrous sulfide ores, including construction of new facilities for recovery of sulfur, iron, copper, zinc, lead, and silver. Construction started on an iron cinder pelletizing plant at Sines.

PRODUCTION AND TRADE

Activities of the mining industry were small by European standards, and the mining industry's enterprises were in the hands of both private capital and the Government. Table 1 shows 1975-77 production statistics for Portugal.

Portugal was a net importer of minerals. By value, minerals imports were 9 times as high as exports, chiefly owing to imports of petroleum and high-rank coals. Tables 2 and 3 show details of Portugal's foreign trade in minerals.

The United States had a positive minerals trade balance with Portugal during 1977. U.S. exports were valued at $27.9 million and imports at $11.8 million. As table 4 shows, major U.S. export items were coal and iron and steel products. Ferroalloys were the bulk of imports from Portugal.

Table 2.—Portugal: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Pigments, mineral —Continued			
Iron oxides, processed	24	18	Cape Verde Islands 9; Mozambique 4; São Tomé and Principe 4; Guinea Bissau 1.
Pyrite, gross weight	61,820	20,218	All to Belgium-Luxembourg.
Salt	568	16,311	Zaire 14,627.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	3,274	620	Angola 256; São Tomé and Principe 136; Mozambique 100; Zaire 100.
Caustic potash and potassic peroxides	5	13	Guinea Bissau 8; Cape Verde Islands 4.
Stone sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Marble and other calcareous	105,966	95,681	Italy 29,375; Spain 25,902; Belgium-Luxembourg 15,076; West Germany 13,439.
Slate	6,240	8,039	Belgium-Luxembourg 3,189; West Germany 1,461; Denmark 1,253; Netherlands 1,043; France 829.
Granite and other	25,426	15,849	Japan 8,234; Italy 4,240; Spain 1,073.
Worked:			
Slate	7,110	6,329	Netherlands 1,598; West Germany 1,423; Sweden 910; Belgium-Luxembourg 808.
Paving and flagstone	96,914	99,089	West Germany 53,756; Denmark 14,678; United Kingdom 13,354.
Marble and other	29,862	22,572	West Germany 9,061; France 3,690; Spain 2,639.
Gravel and crushed rock	43,970	22,156	Gibraltar 21,765.
Limestone (except dimension)	145	50	Cape Verde Islands 36; Angola 9; São Tomé and Principe 5.
Quartz and quartzite	59,847	63,361	Norway 36,136; Italy 18,600.
Sand, exxluding metal bearing	66,140	31,298	Gibraltar 26,260.
Sulfur:			
Sulfuric acid	6,546	140	Cape Verde Islands 92; Zaire 30.
Talc, steatite, soapstone, pyrophyllite	21	18	Mainly to Mozambique.
Other:			
Slag, dross, and similar waste, not metal bearing, from iron and steel manufacture	1,000	5,310	France 5,100.
Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	2,025	2,611	Cape Verde Islands 2,553.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	24	2	Mozambique 1.
Carbon black	2	1	All to Mozambique.
Coke and semicoke	16	97	All to Belgium-Luxembourg.
Hydrogen and rare gases	(1)	2	Angola 1; Guinea Bissau 1.
Petroleum refinery products:			
Bunker deliveries:			
Gasoline, aviation thousand 42-gallon barrels	5	5	NA.
Kerosine do	(1)	1	
Jet fuel do	r943	1,251	
Distillate fuel oil do	r13	(1)	
Residual fuel oil do	r591	653	
Lubricants do	r15	43	
Total do	r1,567	1,953	
Nonbunker deliveries:			
Gasoline: Motor do	43	21	Guinea Bissau 12; Cape Verde Islands 9.
Kerosine do	r73	25	Cape Verde Islands 20; Guinea Bissau 5.
Jet fuel do	r7	6	Mainly to Guinea Bissau.
Lubricants do	r123	71	United Kingdom 31; Spain 21; Belgium-Luxembourg 8.
Other:			
Liquefied petroleum gas do	r10	6	Cape Verde Islands 4; Gibraltar 1; São Tomé and Principe 1.
Mineral jelly and wax do	r37	1	Mainly to Cape Verde Islands.
Unspecified do	(1)	(1)	NA.
Total do	293	130	
Grand total do	r1,860	2,083

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite and concentrate	1,300	1,522	France 1,014; West Germany 498.
Metal including alloys, all forms:			
Scrap	r33	24	Gibraltar 12; United States 5; Netherlands 3.
Unwrought	4,776	9,431	France 2,347; Norway 2,215; Spain 1,856.
Semimanufactures	r9,229	15,585	West Germany 5,203; Austria 2,401; Belgium-Luxembourg 1,971.
Beryllium, beryl ore and concentrate	383	118	Australia 100; United Kingdom 18.
Chromium:			
Chromite	57	713	Netherlands 140; Finland 109; West Germany 103.
Oxide and hydroxide	112	215	West Germany 177.
Cobalt oxide and hydroxide	5	12	Belgium-Luxembourg 8; United Kingdom 3.
Copper:			
Ore	50	15,163	Republic of South Africa 15,103.
Copper sulfate solution	311	(1)	All from west Germany.
Metal including alloys:			
Unwrought:			
Blister	1,345	337	Zambia 287; United Kingdom 50.
Refined unalloyed	8,740	9,804	Canada 4,655; Belgium-Luxembourg 2,700; United Kingdom 1,349.
Other	498	507	Mainly from United Kingdom.
Semimanufactures	r6,958	7,152	France 2,641; United Kingdom 1,214; Italy 850.
Gold metal, unworked or partly worked, troy ounces	r2,942	2,941	United States 1,082; Switzerland 975; Belgium-Luxembourg 872.
Iron and steel:			
Ore and concentrate	386,028	534,395	Brazil 146,683; Republic of South Africa 127,192; Mauritania 111,450; Canada 85,942.
Metal:			
Scrap	5,482	28,588	United States 13,493; West Germany 7,642; Belgium-Luxembourg 3,341.
Pig iron, ferroalloys, similar materials	r36,100	34,308	Spain 24,894; Canada 3,585.
Steel, primary forms	85,955	208,183	Japan 95,951; United States 59,798; Netherlands 21,780.
Semimanufactures:			
Bars, rods, angles, shapes, sections	121,134	94,160	Belgium-Luxembourg 16,302; West Germany 15,592; Sweden 14,257.
Universals, plates, sheets	193,445	171,234	Japan 75,842; West Germany 31,896; Belgium-Luxembourg 19,007.
Hoop and strip	23,108	45,619	West Germany 22,565; Belgium-Luxembourg 14,204.
Rails and accessories	26,882	16,007	France 9,617; Belgium-Luxembourg 4,119 West Germany 1,931.
Wire	15,609	15,777	United Kingdom 4,065; West Germany 3,286; Belgium-Luxembourg 2,703; Japan 1,990.
Tubes, pipes, fittings	29,733	35,660	France 20,939; West Germany 6,476.
Castings and forgings, rough	637	415	Switzerland 106; West Germany 104.
Lead:			
Oxides	54	43	United Kingdom 40.
Metal including alloys:			
Scrap	77	182	Gibraltar 113; Guinea-Bissau 61.
Unwrought	8,362	13,797	United Kingdom 11,149.
Semimanufactures	47	52	Belgium-Luxembourg 25; France 14; United Kingdom 7.
Magnesium metal including alloys, all forms	4	5	Netherlands 2; Japan 1.
Manganese:			
Ore and concentrate	50,617	37,658	Republic of South Africa 17,108; Gabon 15,334; Ghana 5,194.
Metal including alloys, all forms	282	1,414	Netherlands 633; United Kingdom 553.
Mercury, 76-pound flasks	r447	1,271	Spain 917; Italy 200.
Molybdenum metal including alloys, all forms	600	4,000	Netherlands 2,000; Italy 1,000.
Nickel metal including alloys:			
Scrap	142	15	Netherlands 12; Finland 3.
Unwrought	71	69	Netherlands 38; United Kingdom 16; Finland 6.
Semimanufactures	317	467	West Germany 174; United Kingdom 109; Finland 101.
Platinum group metals and silver:			
Waste and sweepings, troy ounces	96	--	
Metals including alloys:			
Platinum gorup, do	r2,411	4,843	France 1,302; Spain 1,182; West Germany 1,102.

COMMODITY REVIEW

METALS

Iron and Steel.—Planning for development of a domestic supply of iron ore and the startup of a new steel plant, the second in the country, were the major events in the iron and steel industry during 1977.

Iron Ore.—Imported iron ore and imported pyrite cinders remained the principal sources of iron ore. Economic conditions in the country, the balance of payments problem, and high unemployment made development of domestic iron ore deposits located in remote areas more attractive. The Moncorvo iron deposit, situated in northern Portugal, was again the object of exploration activities. The ore body occurs in a range of hills reaching a height of 900 meters and extending over 10 kilometers. The main deposits, with estimated reserves of all categories, follow in million tons:

Deposit	Estimated reserves
Cabeco de Mua	82
Carvalhosa	58
Santa Maria	9
Pedrada	180
Reboredo	186
Couto Minerio	34

Three deposits, Cabeco de Mua, Santa Maria, and Pedrada, were selected for the first Moncorvo project by the operator, Ferominas S.A.R.L. Aggregated reserves of these deposits, which were taken into account for economic evaluation, were reported at 271 million tons of ore with an average iron content of 38.9%. Phosphorus content was 0.5%. Hematite is the main iron mineral. Magnetite is also present at the surface but accounted for only 5% of the surface ore. Quartz and sericite are the predominant gangue minerals, averaging 25% and 15%, respectively, of the total.

Plans call for an open pit mine (ore-to-waste ratio 1:0.47), a gravity concentrator, and a pelletizing plant. Capacity was geared toward annual output of 1.5 million tons of pellets by 1980, increasing to 3 million tons after 5 years of operation. In addition to mining facilities, a railroad link between Villa Franca das Naves and Pocinho may be built for transportation of ore to Seixal.

Steel.—A new 200,000-ton-per-year steel plant started production at Maia, north Portugal, in early 1977 but experienced startup difficulties. The largest steel producer remained the plant at Seixal (400,000 tons annual capacity), operated by Siderurgia Nacional S.A.R.L.

Pyrites.—During 1977, pyrites produced in Portugal were used for output of sulfuric acid. However, the Government planned to develop facilities for producing iron pellets from the resultant cinder, and for recovering associated lead, zinc, copper, and gold.

The largest deposits of pyrite and base metal sulfate ores are located in Alentejo Province. Reserves were estimated at 240 million tons, of which about 40 million tons

Digitized by Google

were proven at the end of 1977. The average grade of ore was reported as follows: sulfur, 41% to 46%; iron, 39%; lead, 0.9% to 1.2%; and zinc, 2.2% to 3%. Two deposits, Aljustrel (80 kilometers east of Sines) and Lousal Caveira (36 kilometers north of Aljustrel), were in production, but only sulfur was recovered by two fertilizer producers. During 1977, Cia. União Fabril (CUF) started construction of an iron pelletizing plant at Sines. Technology was provided by Kawasaki Steel Corp. of Japan. Principal raw material will be cinder stored at CUF's sulfuric acid plant at Sines.

In addition, after several years of geological and geophysical research, the French Bureau de Recherches Géologiques et Minières (BRGM) announced discovery of a significant deposit of complex sulfide ore near Neves-Corvo, in southern Portugal. The new deposit is located under 300 meters of cover and contains pyrite, lead, zinc, and silver. However, metal content of samples was not made public at yearend.

Tungsten.—Beralt Tin and Wolfram (Portugal) S.A.R.L. decided to spend about $3 million on capital expenditure at the Panasqueria mine in the central Province of Beira Baixa, including a new shaft. Other expenditures were to be for exploration. During 1977, the financial performance of the Beralt operation in Portugal was affected by exchange losses resulting from the 15% devaluation of the Portuguese escudo and its depreciation against the British pound. Preliminary figures indicated losses reaching approximately $3 million.

NONMETALS

Cement.—Cement was among the most important nonmetals produced in Portugal. At the end of 1977, three companies operated 10 cement plants with an estimated capacity of 5.9 million tons. The largest operating company was Cimentos de Portugal E.P. (CIMPOR) which owns 75% of the country's cement production capacity. CIMPOR operated six cement plants; the one at Alhandra (1.9 million tons annual capacity) was the largest in the country.

Fertilizers.—The Portuguese Ministry of Industry decided to restructure ammonia and fertilizer production into two new public entities, Quimigal E.P. and Petroquimica e Gas E.P. In addition, the Government tentatively decided to consolidate or cancel several investment projects for production of ammonia, nitric acid, and manufactured fertilizer. Details were not made public in 1977.

Pumice.—Exploration for pumice continued on the volcanic island of São Miguel in the Azores. Activities have been centered near the village of Sete Cidades, and reserves of about 10 million tons of pumice were confirmed. A processing installation (principally a screening plant) for pumice was completed near the capital of São Miguel, Ponta Delgada, approximately 20 kilometers from the mining site, by the operator, Sociedade Industrial de Pedra-Pones dos Azores Lda., and first shipments were made in February. Planned shipments of 500,000 tons in the first year of full production (1979) should grow to 1.2 million tons after 3 years. Markets in the northern United States were expected to absorb the new output.

Salt.—During 1977, Povoa de Santa Iria, 50 kilometers north of Lisbon, remained the major center for production of salt. Soda Povoa S.A.R.L., a Solvay subsidiary, produced vacuum salt and brine. Most of the salt was used for production of soda ash, chlorine, and caustic soda on the site at Povoa.

Stone.—Stone was an important mineral product of Portugal. The area around Vila Vicosa-Borba-Estremos, east of Lisbon, remained the major stone producer, accounting for about 70% of the total output.

During 1977, about 300 stone-producing facilities were operational in Portugal. Employment averaged about 3,000 persons.

MINERAL FUELS

Portugal remained dependent on imported fuels for almost all of its energy requirements. Imports were mostly liquid hydrocarbons, but some high-rank coals and coke were also imported. Coal, mostly anthracite, continued to be the principal mineral fuel produced, contributing about 1.8% of the apparent energy consumed in Portugal. The following table shows supply and apparent consumption of fuels and power for 1975 and 1976, the latest years for which complete data were available.

Coal.—About 200,000 tons of coal was produced in Portugal during 1977, all from one mine, a Government-owned operation in northern Portugal near Oporto.

Petroleum and Natural Gas.—There was no production of petroleum or natural gas in Portugal during 1977. Petroleum refineries processed imported crude oil, mostly

[2]1 ton standard coal equivalent (SCE) = 7 million kilocalories.
[3]Less than 0.1 million tons of SCE.

from Iraq, Iran, and Saudi Arabia. In addition, Portugal imported petroleum refinery products from Western European countries. During 1977, efforts were made to revive exploration for oil and gas in Portugal, which had been sluggish and without positive results during past years. In 1977, the Government established the Gabinete para e Pesquisa e Exploracão de Petroleo (GPEP) to coordinate exploration efforts. In the fall of 1977, GPEP offered 22 onshore blocks covering most of the western and southern coastal territory. Terms called for a minimum program of geophysical and drilling work over a period of 4 years, and the Government reserved the right to take a minimum of 50% participation in commercial discoveries. Response to this offer by oil operators had not been made public at yearend.

Construction continued on a 6-million-ton-per-year petroleum refinery at Sines, 90 kilometers south of Lisbon. Completion was scheduled for 1978.

During 1977, two refineries, with an aggregate capacity of about 9 million tons, operated in Portugal and processed about 6 million tons of crude oil.

Uranium.—During 1977, limited exploration for uranium was carried out in two regions, Portalegre and Viseu-Guarda. No major events were reported related to production. Urgeirica Mines, with its beneficiation facility, remained the major producer of yellow cake. Measured reserves of uranium (U_3O_8), located near Moncorvo, Viseu, Guarda, and Nisa, were reported to be about 7,000 tons. Some reports showed 30,000 tons of U_3O_8 in all types of reserves in Portugal.

The Mineral Industry of Southern Rhodesia

By Janice L. W. Jolly[1]

The Rhodesian economy has traditionally rested on three vital sectors, mining, manufacturing, and farming, all of which showed a decline in 1977. The first sector, including minerals and metals, was well developed before the Unilateral Declaration of Independence (UDI) and was the most healthy sector until 1977, when expansion was discontinued and several projects were set aside. The other two, manufacturing and farming, had been at first strengthened considerably by sanctions. In 1977, however, the volume index of manufacturing production had declined by 6.4%. Mining and quarrying contributed about 7% to the nation's gross domestic product (GDP), estimated at $3,552 million.[2] At market prices, the GDP rose by 2.5% during 1977 but contracted in real terms by 6.9%, making 1977 the third successive year of negative growth. The depressed conditions were attributed to the continuing war and deteriorating security situation, the international and domestic recession, loss of technical and management personnel, and stricter enforcement of sanctions.[3] The Rhodesian dollar was devalued by 6% in October 1977. Inflation, estimated at a rate of 10%, was also a problem.

PRODUCTION AND TRADE

Mineral production was valued at $379.2 million in 1977, compared with $368.8 million in 1976. But while mining production volume had increased 7% in 1976 (compared with that of 1975), it had dropped by 5% in 1977. Industrial production of metals and metal products also showed a 14.8% decline. The decline in real value of mineral production was attributed by the Rhodesian Government to a weakening of international commodity markets as well as a tightening of sanctions, particularly the repeal of the Byrd Amendment by the U.S. Congress.

Because of the secrecy that shrouds imports and exports for security reasons, little detailed information was available. Exports in 1977 decreased in general by 2.5% in value and 6.3% in volume, compared with that of 1976. Imports, in general, increased by 1.1% in value but decreased 8.1% in volume. Stricter measures were taken in the second half of 1977 to reduce foreign exchange allocations granted for imports.

The small increase in mineral production value resulted in great part from higher gold and tin prices. Rhodesian gold output in 1977, although no official figures were available, was estimated to be 600,000 troy ounces. By September 1977, gold was bringing $149 per ounce on the Rhodesian market. Most of Rhodesia's gold was derived from three large mining groups, Coronation Syndicate Ltd. (Corsyn), Falcon Mines Ltd., and Rio Tinto (Rhodesia) Ltd.'s properties. There has also been a renewal in the number of small-scale activities by lesser known operators. More than 500 of the country's 1,000 gold mines were reexamined in recent years, spurred by the improving gold market, and more than 200 of these were back in operation. Thirty were reinstated in 1976, and a further 10 mines were reactivated in 1977.[4]

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, modest quantities of unspecified types of crude construction materials (including clays, stone, sand and gravel) were produced, but output is not reported quantitatively and available information is inadequate for the formulation of reliable estimates of output levels. Also, natural corundum, graphite, and mica have been produced in the past and output presumably has continued, but no basis for estimates of output levels is available. Through 1965, annual corundum output was at a level of several thousand tons, ranking Southern Rhodesia second only to the U.S.S.R.

[2]Data are for years ending September 30 of that stated.

[3]Includes nickel content of nickel oxide and nickel fonte.

[4]Output of Inyati mine only.

[5]Output of Beardmore mine only.

[6]Data represent only an approximate order of magnitude.

[7]Data represent sales for years ending Aug. 31 of that stated.

COMMODITY REVIEW

METALS

Chromite.—Restrictions have been placed on dissemination of information on the Rhodesian chromium industry since the 1965 UDI, and no official production figures have been available since. Although information about reserves was also mostly out of date, recent estimates were put at greater than 1 billion tons, up from the 608 million tons of chromite estimated in 1960.[5] Over 500 million tons were estimated to be high-chromium chromite, and Rhodesia was still considered as one of the major sources of metallurgical-grade chromite in the world. Recent estimates indicated that Rhodesia produced about 6% of the total world output and ranked second in world chromite reserves.

The most important factor influencing Rhodesia's chromium industry over the last 10 years was the imposition of economic sanctions by the United Nations Security Council in December 1966. The United States imposed sanctions in January 1967 but by November 1971, with passage of the Byrd Amendment, had made exceptions to the sanctions including chromite. Attempts to reimpose U.S. sanctions against imports of Rhodesian chromite and other essential minerals were successful on March 16, 1977, when the Byrd Amendment was repealed by Congress.

The renewed U.S. import ban and the closing of the Mozambique-Rhodesia border in 1976, which had effectively sealed the traditional route for chromite export, resulted in Rio Tinto (Rhodesia) suspending its chromite operations by 1978, including a pilot ferrochrome smelter in the Rhodesian Midlands. Rio Tinto, which operated the Mtorashanga and newer mines near Selukwe, also experienced heavy losses at the company's nickel properties, and 1977 profits were down by 16%.[6] Early in the year, the Rhodesian Chamber of Mines indicated that 1977 chromite mine output might exceed that of 1976. By yearend, however, Rhodesian ferrochrome and chromite sales were beginning to reflect both the effects of a weak world chrome market, as well as stringent U.S. enforcement of sanctions.

Copper.—MTD (Mangula) Ltd., a member of the Messina (Transvaal) Development Co. Ltd. (MTD) group of companies, reported total copper metal production for 1977 at 15,073 tons. For the 6-month period ending April 31, 1978, a total of 934,200 tons of ore was milled at the Miriam and Norah mines in the Mangula complex, with recoverable copper amounting to 7,979 tons. The Silverside mine showed no production. This compares with the 6-month period ending April 31, 1977, when 877,200 tons of ore were milled with total recoverable copper of 6,616 tons. The Silverside contributed 92,800 tons, with 546 tons recoverable copper, to the early 1977 figures. MTD (Mangula) reported its profits after taxation were $5.6 million in 1977 compared with $9.6 million for 1976. This drop in profits was attributed to low-grade ore encountered at the Miriam and Norah shafts, lower copper prices, and the late commissioning of concentrator improvements. At Miriam, the ore grade fell to 0.93% copper, which when budgeted against the expected grade of 1.08% copper, resulted in a short fall production of 1,900 tons.

At yearend, MTD was planning to expand its copper output by 30% or more, despite the depressed world copper market. The completion of two concentrator extensions at the Mangula and Norah mines made it possible to increase output by 4,900 tons per year. In 1977, MTD's mining costs per ton was $796 and was below the average price ($1,250 per ton) that the company managed to obtain for its copper exports.[7]

MTD's Copper Queen mine (also known as the Sanyati mine), located 90 kilometers west of Sinoia, was reported to have ore reserves totaling 15 million tons with 1.4% copper, 1.35% lead, and 1.85% zinc. Although the grade and size of reserves were good, the ore bodies occurred in a highly folded and structurally complex environment that would make dilution of mill feed unavoidable. Viewed with the recent decline in copper, lead, and zinc prices, Messina Rhodesia Investments Ltd. was deferring the mine's development.[8]

Corsyn reported that although gold revenues had improved during 1977, profits from copper derived from the Inyati mine were down. Ore reserves at the mine dropped from 809,000 tons to 692,000 tons.[9] By yearend, Inyati's milling rate had been reduced by 50%. Ore reserves at the Muriel mine also declined from 316,000 tons to 270,000 tons, reflecting the unpayability on the lower levels of the Main and Pink reefs.

Digitized by Google

The MTD option to purchase the Ayrshire mine was dropped.

Gold.—Falcon Mines Ltd. reported that the Dalny mine milled 238,500 tons of ore, which yielded 7.64 grams (0.25 ounce) of gold per ton for a total of 1,822 kilograms (58,579 troy ounces) of gold for the financial year ending September 30, 1977. Net profit at the Dalny mine was $2.1 million. The tonnage milled was 1,600 tons less than the target figure because of plant breakdowns during the year, but this was made up by a higher recovery grade. Working costs were 4% higher than anticipated. Ore reserves at September 30, 1977, were estimated at 1,118,000 tons with an average grade of 11.9 grams (0.38 troy ounce) per ton over a width of 172 centimeters. The three mines of Falcon's subsidiary, Olympus Consolidated Mines Ltd., were interrupted by serious flooding by early 1978, which could not be brought under control during the first quarter of the year. Development results had been satisfactory at all mines except at the Dawn mine where future ore reserves were tenuous.[10]

The Coronation Syndicate Group (Lonhro Investment Group) operated the Arcturus, Mashona Kop, Mazoe, and Muriel mines. The subsidiary, Corsyn Consolidated Mines Ltd., owned the Arcturus which was one of the country's leading gold producers, employing 30 Europeans and 700 Africans. The success of the last decade was the result of Arcturus' 10-level cross-cut extensions which were pushed through during what were thought to be the last months for the mine. Intersection of the Venus Reef ore by this exploration effort laid the foundation for additional reserves that were expected to last for the next decade.[11] Ore reserves at the Muriel gold and copper mine dropped from 316,000 to 270,000 tons because of unpayability on the bottom levels of the main ore bodies. Total Corsyn gold production was 2,222 kilograms (71,439 troy ounces), compared with 2,315 kilograms (74,429 troy ounces) in 1976. Byproduct gold from Corsyn's Inyati and Muriel copper mines added about 26,000 ounces to this total.

The Rio Tinto group was reworking the old Cam and Motor mine dump and was seeking to reopen the Renco gold mine. Falconbridge Nickel Mines Ltd.'s (Canada) subsidiary, Ventures of Africa Ltd., was producing approximately 18,000 ounces per year from the operations of Blanket Mine (Pvt.)Ltd., including workings from the old Feudal mine.

Iron and Steel.—Additional high-grade iron ore reserves were discovered on the Rhodesian Iron and Steel Co. Ltd.'s (RISCO) Buchwa claim that were expected to extend the steel company's mining life in this area by at least 2 years. RISCO's current iron ore reserves at Buchwa are now expected to last about 17 years at present rate of production. The Buchwa mine supplied RISCO's steelworks at Redcliff. After the extensive expansion in 1976, a large part of the steel plant's output was exported. In 1977, however, RISCO was affected by world recession in the steel market, as well as by the local reduction in demand. Government grants and loans to assist the company through the recession amounted to $20 million. The Government also proposed to raise its stock holding in RISCO from 10.9% to 49.74% of the equity. This money ($13.6 million) was to be used as working capital. The other shareholders were also offered increased equity.[12]

Nickel.—By yearend 1977, Johannesburg Consolidated Investment Co. Ltd.'s (JCI) Shangani nickel mine had cut back its operations by about 50% to limit expenditures and bring production back into line with sales. In order to stop rising of mine costs, mining was discontinued in the lower grade West Pit, and the rate of waste stripping in the East Pit was reduced. A decision to reduce mill throughput was made in October. Earlier, for the year ending June 1977, the tonnage milled had been increased to 1,219,000 tons, compared with 418,000 tons in 1976, to compensate for lower than expected nickel recoveries. Production from the pit also had been accelerated above 500,000 tons per month in order to reduce overhead and enable JCI to withdraw from the pit where walls were deteriorating. A total of 6,380,000 tons of ore and overburden were hauled from the open pit, compared with 6,450,000 tons in 1976. Shangani (owned 49% by JCI) had a net loss for the year ending June 1977, amounting to $3.5 million, which when added to the loss brought forward, gave an accumulated sum of nearly $9.6 million. JCI borrowed $14.4 million to finance increased stockpiling, and by early 1978, nickel stocks were built up to 550 million pounds.[13] By yearend 1977, over 100 of the total 440-person work force were laid off. Most world producers had cut back production as the soft nickel market continued, and the future prospects for Shangani looked bleak.

Rio Tinto operated the Empress mine; the Perseverance mine's operations were sus-

Digitized by Google

pended since 1975. Whereas in 1976 most of Rio Tinto's profit came from the Empress, by 1978, the first quarter profits from the Empress had slumped by 51% because of depressed nickel and copper markets.[14]

Anglo American Corp. completed exploratory drilling in 1977 with low-grade nickel deposits discovered. By July, the company announced withdrawal of its geological team and suspension of its prospecting activities in Rhodesia. Through its subsidiary, Rhodesian Nickel Corp. Ltd. (Rhonick), Anglo operated the nickel mines at Trojan and Madziwa in the Bindura/Shamva area and the new Epoch mine at Filabusi, as well as the Bindura smelter.

Rhonick reported that the amount of ore milled at the Trojan mine was higher in 1977, and in spite of a lower grade, the production of nickel in concentrate was the highest ever achieved by the mine. The average production rate at the Epoch mine mill was 35,000 tons per month. Plant and underground mining capacity had been extended in 1976 to increase the milling rate from 25,000 tons per month. Improvements were made in the metallurgical recovery along with minor plant modifications and careful operation. This resulted in the nickel in concentrates being 40% higher than last year. The tonnage at the Madziwa mine was only marginally above that milled in 1976. The Madziwa ore bodies were extremely erratic and complex. The random distribution of high-grade ore, together with complex ore body structure, resulted in a greater dilution of ore with waste rock. Refinements to the mining method were being continuously pursued in an attempt to increase the nickel content above 0.60%. An increase in security commitments had placed a very heavy load on the staff with up to 25% of the employees absent from time to time.[15]

Tin.—Kamativi Tin Mines Ltd. announced improved profits for the year ending December 31, 1977, and a dividend of 10% was paid.

Uranium.—Early in 1977, five exclusive prospecting areas for uranium in the Kariba Lake area were being searched by the firm Prospecting Ventures Ltd., an Anglo American Corp. subsidiary. Deposits discovered 30 years ago near Binga were considered too small for development. By July, however, Anglo had announced withdrawal of the prospecting team from the area owing to the deteriorating security situation there.

NONMETALS

Asbestos.—Rhodesia's asbestos output was estimated to be about between 200,000 and 350,000 tons per year. Official statistics on the industry were not available. The largest producer was the Rhodesian and General Asbestos Corp. (Pvt.) Ltd., which operated the Shabanie, Gaths, Temeraire, and King mines in the Shabani and Mashaba districts. The company also held mining leases at Crown Land in Victoria. Pangani Asbestos Mines (Pvt.) Ltd. operated the Pangani mine near Bulawayo, the Vanguard mine near Gwelo, and the Boss mine near Victoria. Kudu Mines (Pvt.) Ltd. operated the Kudu mine and the two Wynnes mines near Bulawayo. In addition, A. D. Theron and Sons (Pvt.) Ltd. operated the Thornwood mine near Bulawayo; D.S.O. Asbestos (Pvt.) Ltd. operated the DSO mine at Crown Land, Victoria; and the Elenem Syndicate operated the Sihande mine in Gwelo. Milling and grading facilities process a high proportion of spinning fibers and a wide range for use in the manufacture of asbestos cement. Some was processed at Turner and Newall's asbestos cement plants in Salisbury and Bulawayo in Rhodesia, in Durban, South Africa, and Lusaka in Zambia. The main asbestos cement manufacturer in Rhodesia was Turnal Ware Sales of Salisbury.

Barite.—Barite produced for the local paint and glass manufacturing industries was estimated to be about 100 tons per year. Production was from four mines including the Dodge mine near Shamva (in operation since 1949)., the Argosy mine near Que Que and the Dick Mick and Staff mines near Bulawayo. Rhodesia was estimated to have barite ore reserves in excess of 500,000 tons.

Cement and Limestone.—Three cement plants were producing in 1977. United Portland Cement Co. (Pvt.) Ltd. had one plant at Bulawayo with a 210,000-ton-per-year capacity and another at Colleen Bawn with a 255,000-ton-per-year capacity. The Salisbury Portland Cement Co. Ltd. operated a 120,000-ton-per-year plant at Manresa, Salisbury. Limestone used in the manufacture of cement was quarried at Colleen Bawn near Gwanda and at Sternblick and Salisbury. Agricultural limestone was also produced at a number of localities, but the principal firms quarried Lomagundi dolomites near Sinoia.

A limestone quarry at Redcliff, near Que Que, produced metallurgical—grade lime-

Digitized by Google

stone for the steel industry. The flux requirements of the copper and nickel industries were being furnished by the Early Worm Mines near Concession and the Dodge mine northeast of Salisbury.

Corundum.—Production and trade patterns for natural abrasives changed little during 1977, although worldwide demand for both natural and synthetic types improved significantly. Of the total 1977 world mine corundum output of 11,500 tons, Rhodesia was estimated to produce about 2,700 tons.[16] Rhodesia was considered to be the world's second largest supplier of corundum, after the U.S.S.R. Most (97.8%) of the corundum produced in Rhodesia was the "boulder" or massive cryptocrystalline variety, although some crystal corundum was also produced. Most of the corundum was derived from the O'Briens Claims, located on the Somerset Farm near Concession, about 56 kilometers northwest of Salisbury. The Rhodesian Corp. Ltd. had been mining these claims continuously since 1953. Between 1953 and 1965, an estimated 36,000 tons of natural "boulder" corundum had been produced. Total ore reserves at the O'Briens Claims were estimated at 52,000 tons including 30,000 tons eluvial corundum; a minimum of 1,800 tons granulite corundum at the Central Quarry deposit, estimated to a depth of 15 meters; and 18,000 tons at the South Quarry deposit, estimated to a depth of 10 meters. Corundum has also been produced from deposits located in Belingwe, Corundum Eastland Rank, and the eluvial deposits at Weluzani.[17]

Diaspore.—In the vicinity of Wankie, diaspore nodules occur in lenses up to 3 meters thick in the Pleistocene gravels making up the erosional surface on gneiss. Diaspore nodules extracted from these gravels at the Van Beck Claims, situated on Nuanetsi Ranch on the eastern side of a Bumburudza River tributary, were being used as a flux by the ferrochrome industry.

Fluorite.—About 200 tons of fluorite was produced in 1977 for use in local foundries. The main deposit was located at Tinde Fluorite, owned by Matabeleland Exploration Co. (Pvt.). The deposits occur on northeast fault zones related to the Zambezi Trough in the vicinity of Kamativi. Tinde Fluorite was estimated to have reserves of about 200,000 tons.[18]

Magnesite.—Magnesite, produced mostly for export and used in chrome-magnesite bricks, was being produced from the Barton Farm magnesite deposit, operated by Refractory Minerals (Pvt.) Ltd. and owned by Vereeniging Refractories. The Pande mine near Beitbridge and the Calac occurrence of the Nuanetsi district were both dormant. The Barton Farm deposit was considered unique in being sedimentary in origin and Archaean in age and was compared with the magnesite horizons of the Adelaide System of South Australia. Open pit methods were initially used, but this has been superseded by underground mining.

Mica.—Mica was being produced from the pegmatites of the Miami district, located 32 kilometers northeast of Karoi. Pegmatites, with commercial quantities of mica, occur in an area running from the Mozambique border through Mount Darwin and the Urungwe area to Kariba Lake, but the most abundant area occurs near Miami. Mitmar (Pvt.) Ltd. was operating several mines in the Salisbury district near Karoi.[19] Lomagundi Mining (Pvt.) Ltd. was operating a mine and grinding plant with a 2,000-ton-per-year capacity of minus 1/2-inch mica flakes. Bruna Minerals Exploitation (Pvt.) Ltd., an associate of Messina Mica (Pvt.) Ltd., operated the Ubique/Rhuwesa mine at Wankie with an annual capacity of 2,500 tons per year. A variety of mica products including heating elements, drilling mud flakes, stamping, and waste for the electrical industry were also being produced. The Rhodesian vermiculite industry was dormant. About 1,000 tons of both wet and dry ground mica was used locally by the paint and rubber industries.[20]

Quartz/Silica.—Quartz was being produced at the Japempi Block mine in Bulawayo district, at the Broadside, Duzi, and Ruth mines of Gwelo district, and the Chiten, Patronage, Todoma, and Rubeni mines of the Salisbury district.[21] Lomagundi Smelting & Mining (Pvt.) Ltd., at Sinoia, was producing 12,000 tons per year for use in copper smelting. The Lone Kop deposit, located near Hartley, was estimated to contain 3 to 5 million tons of high-grade (+98%) silica and has not been exploited. Most industrial requirements, including those of the ferrochrome industry, are met by the mines of the Gwelo district. Ground silica, produced near Salisbury, was being used in the manufacture of enamel.[22]

MINERAL FUELS

Coal.—The Industrial Development Corp. (IDC) was completing investigations into oil-from-coal processes. Reports indicated the

Digitized by Google

country could not now, or in post-sanctions situations, afford an oil-from-coal plant in the scale of South Africa's SASOL plant. A first-stage plant of modest proportions was suggested as more suitable to Rhodesia's needs and resources. Additional capacity could be added later on a modular basis as funds and overseas expertise became available. IDC was also involved in a joint investigation with the Bulawayo Municipality into the feasibility of producing gas, liquid fuels, and other byproducts from Wankie coal. IDC was also granting funds to RISCO to enable the benzol plant at Redcliff to be overhauled and recommissioned. Until late 1975, this plant was producing benzol as a byproduct of the coking plant. Production was expected to recommence in early 1979.[23] The Government was also studying a scheme to convert maize into fuel to reduce gasoline imports.

Recent exploration by IDC had located coal resources of about 700 million tons in the Lubimbi and Gwasi areas, located 75 kilometers southeast of Wankie; the coal and bituminous shales had an average ash content of 50%. Some 350 million tons had an average content of 27%, all of which could be extracted by open pit methods. The coal in the Lubimbi/Gwasi areas did not contain clearly defined coal seams and was a thick body of intercalated coals and bituminous shales that would require washing treatment. It was estimated that for every 100 tons mined, 10 tons would be recoverable as high-quality coking coal of 10% ash content, and about 50 tons would be waste shale of 73% ash content.[24]

The total size of Rhodesia's coal reserves were unknown. Rhodesia, well endowed with coal, was estimated to have 11% of the total known coal reserves on the African continent. Current estimates indicated that Rhodesia's coal reserves were sufficient to see the country through the next 200 years or longer. Unexploited reserves at Wankie were believed to be in the order of 2,250 million tons, while resources in other parts of the country had been assessed at about 5,080 million tons. Definitive figures varied, however, with one estimate indicating a total probable reserve of some 2,500 million tons, of which only 750 million tons were extractable. Of this amount, 59% was considered low-ash coal suitable for coking and the rest suitable for steam coal. In addition, there was a possible reserve of 5 billion tons of lower grade coals and carbonaceous shales.

The No. 4 colliery at Wankie was closed and put on a care-and-maintenance basis in late 1977 because of a drop in coal sales. Sales for the year ended August 31, 1977, had dropped by 20% to 2.2 million tons. All market requirements were being met by the No. 3 colliery and the open pits. Production at the No. 4 colliery had been 61,500 tons in August, but coal sales had dropped because of the continuing general decline in the economy. Wankie employed about 5,300 Africans and 500 Europeans.

Coke ovens at Wankie were to be operated at a minimum, but active coke exports were expected to reduce Wankie's large coke stockpile. Coal sales by Wankie Colliery Company Ltd. for the year ended August 31, 1977, fell 25% to 2,197,000 tons, while coke sales at 194,000 tons were 14% less than in 1976. At yearend, an agreement was reached for a 10% price increase for all of the company's products.[25]

The Mineral Industry of Romania

By George Rabchevsky[1]

Even though Romania has many natural resources, by almost every economic indicator it is still one of the less developed countries. Among East European countries, Romania is second only to Poland in area and population and has long been a major European producer of oil, and more recently, natural gas. The current 5-year plan (1976-80) places heavy emphasis on the development of the chemical industry, which is slated to grow at an annual rate of 15%.

In spite of the severe damage ($2 billion) caused by the March 4, 1977 earthquake, the overall economic performance in 1977 registered a 14% increase instead of the 11% stipulated by the plan. Not unexpectedly, numerous projects were delayed or postponed as a large proportion of the available funds had to be reallocated for reconstruction work. The disaster had especially placed an added strain on the already tightly stretched building materials industry.

A further problem was the acute shortage of trained workers, particularly for the high technology industries, so that labor productivity remains low by both Western and East European standards. In 1977, large groups of workers in Romania began receiving increases in salaries. The wages were increased in two stages: The first stage began on July 1, 1977, and the second stage will start September 1978. In the mining industry, for example, the wages were increased 20%, the highest percentage for the entire economy, while the pay for machine and metal workers was raised by 18%. During the 5-year plan, the total wage increase in those two sectors was 35% and 31%, respectively. The pay increase for ferrous metallurgical and coking chemical industry amounted to 19% in the first stage and to 33% for the remaining 5-year period. In the mining industry, a miner with a net monthly base pay of 3,000 lei[2] receives a 750 lei monthly raise during the first stage. In the ferrous metallurgical and coking chemical industry, the pay increases in the first stage ranged from 265 to 504 lei for skilled workers and from 196 to 280 lei for unskilled workers.[3]

One of the most pressing problems of the Romanian economy is reducing consumption of energy and raw materials, so that its natural resources could be preserved. For example, in 1938 Romania produced 284,500 tons of steel and the availability of iron ore and coke were considered sufficient. But by 1975, even though extraction of iron ore had increased to more than 3 million tons, it was far from satisfying the need of the steel industry, resulting in increased imports. The need for more imports is also evident for other raw materials such as nonferrous metals, crude oil, and others. Romania, therefore, initiated a conservation program of its own, long before the rise of the worldwide energy crisis.

The 1977 plan stipulated annual investments worth 181 billion lei,[4] but actual investments in 1977 fell short of target and reached a level of 169 billion lei. Romanian investments in 1977 in the various industries are shown below (in billion lei):

Digitized by Google

Industry/sector	Planned	Actual
Agriculture	21.2	23.8
Construction	5.0	10.7
Education - culture	6.4	3.0
Housing	18.8	16.5
Industry	96.5	80.7
Scientific research	1.2	1.2
Trade	5.1	5.4
Transportation - communication	16.2	17.5
Total, industry sector	170.4	156.8
Total, all sectors	180.5	169.0

In 1977, a large number of new ministers and minister-secretaries of state were appointed, the leadership of the entire judicial establishment was reorganized, and one-fourth of the country party first secretaries were assigned different positions.

Government Policies and Programs.—Romania's 1978 plan provides for higher growth rates in all main areas of the economy, industrial and agricultural output, industrial investment, and foreign trade turnover. According to the Grand National Assembly, the overall industrial production in 1978 is to total 822 billion lei. In 1978, the estimated number of workers in the economy will total 7 million and the 1978 national income is to be 500 billion lei. In 1978, the volume of foreign trade is to amount to 82 billion lei. Thus, despite certain problems, especially the acute shortage of skilled labor and the lack of adequate energy resources, the outlook for the economy remains relatively favorable.

The following 1978 production levels are planned for selected commodities:

Commodity	1978 production goals
Electric power, million kilowatt-hours	64,510
Net coal, thousand tons	36,440
Extracted crude oil, do.	15,100
Extracted methane gas, million cubic meters	26,830
Steel, thousand tons	12,070
Primary aluminum and aluminum alloys, do.	210
Industrial machinery and technological equipment, million lei	15,300
Chemical fertilizers[1], thousand tons	3,100
Cement[2], do.	16,200

[1]Equivalent of 100% active substance.
[2]Equivalent of 80% clinker.

According to the plan, in 1978 the total volume of investment in the national economy will be 213 billion lei. The industry's portion of this investment (which includes drilling equipment) will be 118 billion lei and 2 billion lei are allocated to scientific research and technological development; some 2.4 billion lei was slated for investment in environmental protection. The Council of Ministers further stressed that in 1978 the industry should strive to make greater use of substitute materials, utilize more secondary materials and scraps, and accelerate the utilization of purchased licenses and developing technologies on the basis of licenses already in production.

Important investment increases in 1978 are again envisaged for the Ministry of Mines, Petroleum and Geology (7 billion lei); and for the Ministry of Metallurgical Industry (6 billion lei). Funds to the former Ministry are allocated for the improvement of production at the lignite mines in Oltenia; for the Petrila coal processing unit; for the additional mechanization of coal mining in Jiu Valley; for the opening of the Cimpulung-Sud lignite pit and the Petrila-Sud mine; for the opening of the Coranda Hondol Complex iron ore deposits; for the Valea Morii copper ore deposits, including those in Hunedoara, Baia de Arama, and Mehedinti Counties. Investment funds to the Ministry of the Metallurgical Industry are provided for the continuation of work at the Calarasi iron and steel plant, for the improvement of coke production at the Galati iron and steel plant, for the development of block and pillar forgings at the Tîrgoviste combine for special steel, for development of sections of welded drill pipe coupling and tubing for deep drilling at I.T. Republica, for the Drobeta Turnu Severin small-section rolling mill, and for the Otelul Rosu medium and special section rolling mill. The ministry of electrical power is budgeted for the work on district stations operating on coal in Calafat and Timisoara, for the Runcu-Firiza hydropower station, and for the continuation of work at the Craiova II power station. Other projects, began in 1977 as part of the sixth 5-year investment plan and still being constructed, are the hydroelectric power stations on the Danube, the Irongates II-Gruia Station, on the Olt River in the Turnu-Calimanesti region, and on the Sebes River at Sascior and Petresti.

It is also planned to intensify geological prospecting and exploration work for the location of new industrial mineral resources, especially crude oil, natural gas, and ferrous and nonferrous ores; a better exploitation of the low-grade iron and copper ores; and raising the index of recovery of crude oil.

According to Dr. Engr. Elena Ceausescu,

Digitized by Google

research will be stressed on producing nonferrous metals through the utilization of native ores and the extraction of rare earths to meet the needs of the electronics, nuclear power, and aerospace industries. In addition, output of ammonia soda, barium salts, and sodium dichromate is to be raised 80% to 90%. In the field of mineral fertilizers, research will be undertaken on the diversification of combined and compound fertilizers and liquid fertilizers.[5]

In the next 5-year plan, industrial production is expected to rise by 55% to 60%, so that by 1985 industry will be contributing almost 70% (56% in 1976) to the total national income. In the mining industry, special attention is to be devoted to the expansion of domestic raw materials and energy. Iron ore will continue to be extracted from the known rich deposits but lower grade deposits will also be mined; for example, at Palazu Mare-Constanta. An intensified mining effort of the cupriferrous ores is to be initiated in Maldova Noua, Roşia Poieni, and Valea Morii. A more efficient exploitation of the bauxite reserves using improved technologies, is also planned. The industrial uses of potassium salts and titaniferrous alluvium, and the accelerated development of sulfur production are also proposed. Techniques are to be developed for the extraction and preparation of siliceous ores of manganese and serpentines and for the recovery of vanadium from iron ores, and molybdenum from the cupriferrous concentrates. Some of the existing metallurgical plants are to be enlarged to increase production capacity for pig iron, crude steel, and rolled steel. For example, renovation is to be initiated at the Calarasi iron and steel combine, the construction of which began during the current (sixth) 5-year plan. Quality steels will begin to be manufactured, including stainless and high-melting steels, and super-strong rolled steels and pipes.

Various types of equipment and machinery in use by the mining industry are to be improved and expanded, such as the equipment for metal processing, iron-rolling mills, pipe and wire mills, and the introduction of electric and large capacity furnaces. Crude oil refineries are to be built capable of catalytic gasoline reforming, hydroforming of diesel fuel, hydrocracking, and catalytic cracking. The oil tanker fleet and equipment are also to be expanded in line with the refineries' increased capacities. Besides the added oil tankers, high-tonnage ore barges and storage tanks are also to be built to take care of the anticipated domestic and export transportation needs.

The search for new energy resources will include deep oil and gas drilling on land, the exploration of the Black Sea continental shelf, the improvement of crude oil recovery techniques, and the increase in production of coal. Underground gasification of coal and oil shale are also planned. By 1985, coal and oil shale are to constitute 50% of the fuels used for the generation of energy and 20% of that energy is to be generated by water power. New hydroelectric plants are to be built along the Danube and other waterways. The construction of nuclear powerplants is also to be stepped up, so that eventually the utilization of hydrocarbon fuels will be at the minimum.

The chemical industry will continue to be one of the most vital industries in Romania in 1985. In addition to oil-processing expansion, the petrochemical industry will attempt to produce plastics that will replace metals, thus easing natural raw material usage. The production of chemical fertilizers is also to be increased. An increase in utilization of halite, sulfur, and potash is envisaged, together with the manufacture of new products such as magnesium oxide, titanium pigments, potassium, nickel, and cobalt salts.

In addition to fuel and materials conservation and improved technological measures, the 5-year plan also stresses the recovery of secondary products and processing of wastes, and the preservation of the environment. The support and implementation of scientific research and technological development in the seventh 5-year plan are to exceed the level of the current 5-year plan by about 50%, employing more than 180,000 persons by 1985, of which 65,000 are to be in high-level research. To implement the goals of the seventh 5-year plan (1981-85), Romania will have to make an investment 1.4 times that of the 1976-80 period.

PRODUCTION

To achieve the goals of the current 5-year plan, special attention was paid in 1977 to the utilization of scrap, which was expected to make up 30% to 40% of Romania's total

Digitized by Google

raw material requirements; instead a 42% level was achieved. The 1977 consumption (in tons) of some selected commodities is shown in the following table:[6]

Commodity	Production	Consumption
Aluminum	209,000	140,000
Copper (refined)	48,000	60,000
Lead (refined)	41,700	45,000
Nickel	NA	6,000
Tin	NA	3,200
Zinc (smelter)	51,860	45,000

NA Not available.

The actual total value of 1977 Romanian production was 754 billion lei, instead of the 735 billion lei originally set in the 1977 plan. However, the data also show that 63% of the targets were unfulfilled, several were of major significance. The following table compares the original 1977 plan figures with the actual achievements for some of the commodities where targets were not met.[7]

Commodity	Production, 1977	
	Actual	Planned
Electric power, million kilowatt-hours	59,858	63,110
Coal (mined), thousand tons	29,144	33,530
Crude oil, do.	14,650	14,850
Steel, do.	11,457	11,695
Rolled steel, do.	8,392	8,708
Lead (refined), tons	41,700	47,600
Zinc (smelter), do.	51,860	55,400
Chemical fertilizers, thousand tons	1,981	2,882

The devastating earthquake that struck Romania may only partially be blamed for the lag in production. However, the production of chemical fertilizers was hindered by the serious quake damage to the petrochemical plants in Turnu Magurele and Teleajan.

Conservation of raw materials by the industry continued to be stressed in 1977. According to Romanian media, an increase of 1% in the volume of processed scrap could provide about 150 million lei of additional raw materials per year for the economy as a whole. In 1977, the utilization of scrap metal made up about 42% of the entire steel production, 37% of domestic copper production, and 32% of lead production. Metallurgical slag was also processed for its iron (about 100,000 tons), while the remainder was used as construction material. In the manufacture of cement, for example, in addition to slag, wastes were used from gypsum phosphates, concentration tailings, and ashes.

In 1977, 535 production projects were put into operation, of which 491 were industrial. At the Galati iron and steel works, a coke plant, cold- and hot-rolling steel mills, and a magnesium lime block plant were put into expanded production. Production capacities were also increased at the Resita iron and steel combine and at the Tîrgoviște special steel complex. The No. 2 pipe mill at the Roman Pipe Enterprise was put into production, as was a special sections mill at the Otelul Rosu Enterprise; and a casting foundry at the Vlahita Iron Works was put into production. New production facilities were installed at the Baia-Mare mining equipment enterprise and new alkyl-phenol and ammonia installations began producing at the Brazi petrochemical combine. Expanded production of ammonia began at the Arad, Craiova, and the Turmu Magurele fertilizer plants. And, finally new types of cement began to be produced at the Hoghiz and Mintia complexes, with new units capable also of prefabricated concrete manufacture started in Bistrita, Bucova, Iasi, and Bucharest.

Table 1.—Romania: Production of mineral commodities[1]

Total ---- do	134,106	156,591	157,072

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, antimony, asbestos, gypsum and natural gas liquids as well as a variety of crude construction materials are produced, but output is not reported quantitatively, and available information is not adequate for formulation of reliable estimates or output levels.

[2]Previously erroneously listed as including blast furnace ferroalloys.

[3]Romanian sources do not indicate whether refinery fuels are reported as a part of the listed product yields or not. Moreover, additional minor products may be produced, but are not listed in official sources.

TRADE

The Romanian foreign trade turnover (exports plus imports) in 1977 reached 69,773 million lei, an increase of 15% over that of 1976. Exports amounted to 34,894 million lei, which is a 14% increase over that of 1976, and imports were 34,879 million lei, which is 15% higher than in 1976. Thus, the budget of 70 billion lei was slightly short of the plan target. According to the 1978 plan, the volume of foreign trade will amount to 82 billion lei, a 17% increase. In the 1976-80 period, foreign trade turnover was planned to increase by nearly 17% per year. Romanian export and import indicators are not published separately, but overall trade goals emphasize an increase in industrial exports, particularly those paid for in convertible currencies.[8]

In 1977, Romania continued its expansion of international economic cooperation. Approximately 300 projects and 20 agreements of understanding in economic and technological cooperation were concluded, 128 new facilities and joint companies were set up abroad and 31 in Romania. Of the 57 joint production companies, 8 were headquartered in Romania and 28 abroad, and 35 new commercial companies were established.[9]

Economic relations and cooperation with CMEA[10] member countries and other centrally planned economy countries continued to be expanded and diversified in 1977. Commercial exchange and cooperation with the developing countries and with the market economy countries was also promoted and developed. In 1977, Romania had economic and commercial exchanges and cooperation with 140 countries. Approximately 19% of Romania's trade is with the Soviet Union (13,341 million lei in 1977), which is its most important supplier of iron ore, coke, and other raw materials. Romania's second largest trading partner in 1977 was

Digitized by Google

the Federal Republic of Germany, (5,201 million lei) which held a 7.5% share of Romanian trade. The Democratic Republic of Germany took third place with 5,106 million lei, followed by Czechoslovakia with 3,614 million lei; Poland followed Czechoslovakia with 2,805 million lei. The United States was in sixth place with 2,796 million lei in 1977. Despite Romania's efforts to balance its trade with developed western countries by increasing exports of finished goods and by reducing imports, the actual trade balance was worse in 1977 than in 1976.[11] Romanian trade has been operating at a deficit (although recovering somewhat from a post-1974 slump), especially with Switzerland and Japan, but now also with the Federal Republic of Germany and the EEC[12] as a whole. Worldwide, Romanian trade showed a deficit of 14 million lei.

The U.S. share of the Romanian market in 1977 was 4%. Romania's 1978 foreign trade plans include a $650 to $750 million level with the United States.[13] Strong ties were maintained with the United States and Romania was the second CMEA member after Poland to be granted "most favored nation" trading status by the United States. One of the major agreements of 1977, for example, was negotiated by Romania with the Island Creek Coal Co. of the United States.

In the field of nuclear power, negotiations with Canada for the delivery of nuclear power stations to Romania began in 1969 and have continued since then. According to some reports, an agreement is to be signed in 1977 for work on the first nuclear plant to begin in 1978. It should also be recalled that a Romanian-Soviet agreement to build a 440-megawatt nuclear powerplant in Romania was signed in 1970, with the plant to start operating in 1978.

Romania is the only Warsaw Pact country that maintains normal state and party relations with Mainland China. The total exchange between Romania and China increased from 342 million lei in 1960 to 2.5 billion lei in 1977. An increase of 20% was planned for 1977 (4% actual) and a significant increase is anticipated in 1978. Romania is looking for new energy sources and may offer in exchange for Chinese oil its high-quality drilling equipment. China may also be capable of providing Romania with nuclear power technology, now sought by Romania on the world market.

Romania is also cooperating successfully with Greece on various projects, one of them being the exploration of Greek oil deposits, discovered in 1973 in the Mesta River Valley in Greece. Romanian transactions with Greece amounted to 775 million lei (US$115 million) in 1977, and are expected to increase in 1978. Romanian exports to Greece include chemicals and machinery, while its imports are mainly food stuffs, but also bauxite.

Exports.—In recent years, the Romanian foreign trade has undergone a change in two significant ways: (1) Romania has gradually abandoned the position of exporter of raw materials and fuel, and (2) Romania has now become an importer of raw materials and fuel for its industry. Nevertheless, some groups of goods still make up a large portion of Romania's exports, especially those that require only a low degree of processing. Thus, even though 8,844,000 tons of crude oil were imported in 1977, significant quantities of petroleum products requiring primary processing were exported during the same year. The following table shows some of the primary products that were exported by Romania in 1977.[14]

Table 2.—Romania: 1977 production and exports of some primary products

Product	Produced (thousand tons)	Exported (thousand tons)
Gasoline	4,466	1,786
Diesel fuel	6,482	2,025
Fuel oil	7,656	2,502
Mineral oils	606	339
Ferrous mill products	8,392	1,353

Romania is one of the largest producers and exporters of equipment for petroleum and gas drilling extraction and processing. The equipment-machine building and chemical industries in 1976 accounted for over half of Romania's total exports and in 1977 the former accounted for 27% of its exports. This trend is expected to continue to 1980, and by 1990 machine building alone is expected to account for 45% of its exports.

Imports.—Romania's imports in 1977, as in previous years, consisted mainly of two commodity groups: (1) Fuel and mineral raw materials, imports of which dropped from 41% in 1976 to 34% in 1977; (2) machines and equipment, imports of which grew from 32% in 1976 to 37% in 1977.

Despite the measures to conserve fuel and raw materials, Romania was forced to increase its imports of crude oil from 8,475,000 tons in 1976 to 8,844,000 tons

Digitized by Google

in 1977, and imports of iron ore from 11,740,000 tons to 12,402,200 tons. Romanian oil was most likely supplied, as in the past, largely by Iraq, Iran, Kuwait, and Libya. In this connection, it should be noted that Romania's own oil production fell slightly in 1977 by 50,000 tons compared with 1976, and its iron ore production dropped by 13% from 2,835,000 tons to 2,467,000 tons.

The U.S.S.R. is Romania's main trading partner. Romania obtains from the U.S.S.R. hard coal, metallurgical coke, iron ore, asbestos, apatite concentrate, pig iron and ferroalloys, rolled ferrous metal products, and scrap and rolled nonferrous metal products. Complete installations of large-scale enterprises in the metallurgical, power, and chemical industries also account for a large share of Soviet deliveries. Those included the metallurgical complex in Galati, Tîrgoviste, and Iasi; chemical complexes in Borzesti; and the hydroelectric power station in the Iron Gates region. According to existing agreements, Romania will receive natural gas, a considerable quantity of pelletized iron ore, asbestos, and certain types of ferroalloys from the U.S.S.R. for a long time, at least until 1990.[15]

The average annual growth rate of Romanian trade with Bulgaria, its southern neighbor, was 21% in 1970-77. In recent years, Romanian imports from Bulgaria were made up of machinery, equipment, fuels, mineral raw materials, and metals, essentially the same items as those imported from the U.S.S.R. The average growth rate of imports of fuels, raw materials, and metals was 25%, 21% for machinery and equipments, and 20% for chemical products and fertilizers. Commodity items such as coke, steel, pipe, ores, metals, and so forth were also imported from Bulgaria. Of great significance to the Romanian-Bulgarian economies is their joint use of the electric power system. The two countries (in cooperation with the U.S.S.R.) have agreed to build a 750-kilovolt electric transmission line from the Odessa substation (U.S.S.R.) by way of the Mucin substation (Romania) to the Dobrudzha substation in Bulgaria.[16]

Table 3.—Romania: Exports of selected mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975[1]	1976[2]	Principal destinations, 1976
METALS			
Aluminum metal including alloys:			
Scrap	7,194	2,329	Italy 1,586; West Germany 699.
Unwrought	84,700	[3]75,000	Japan 25,834; Hungary 12,304; France 11,101.

COMMODITY REVIEW

METALS

Even though Romania is not rich in mineral resources, the mining and metallurgical industries are quite diversified. Iron ore mining and steel production are important aspects of Romanian ferrous industry. The production of the metallurgical industry rose by 11% in 1976 and again by 11% in 1977. The country occupies 14th place in the world in per capita production of steel. Results for 1977 in metallurgy are considered good and are officially attributed to the introduction of new technologies and better use of existing equipment. They may also reflect the more extensive use of productivity bonuses in steelmaking.

Since the basic raw material used for

Digitized by Google

metal production (ores, coke, and coking coal) are largely imported, their rational use, as well as strict conservation of fuel and power resources, were one of the major objectives of the Romanian economy in 1977. Romania is deficient also in the nonferrous metals, most of which it receives from the U.S.S.R.

There is lack of reliable information on Romanian bismuth, gold, and silver production. However, since these metals are derived as a byproduct from ores processed for other metals, mainly lead, copper, tin, and molybdenum, quantities are most likely produced in Baia-Mare, Roşia Montana, Moldova or Bolan areas.

Aluminum.—In 1977, Romanian production of primary aluminum reached 209,000 tons, an increase of only 1% over that of 1976 and 2.5% over 1975. The single aluminum reduction plant at Slatina again surpassed its annual production capacity of 200,000 tons in 1977.

Bauxite is provided partly from domestic mines located in the Oradea area near Dobresti and partly from imports from Greece and Yugoslavia. Romanian imports of bauxite from Greece are expected to be 850,000 tons in 1978.[17] The two Romanian alumina plants of 250,000 tons per year capacity each are located near the Oradea bauxite mines and near Tulcea in the Danube delta. Expansion of these facilities to use siliceous bauxite from Ohaba-Ponor will eventually raise the aluminum metal output to 260,000 tons by 1980. The Tulcea enterprise was put into operation in 1973 and is the largest Romanian alumina plant, with an annual processing capacity of 600,000 tons of bauxite. The Tulcea enterprise continued in 1977 to upgrade its new foil-rolling mill and to experiment with the production of new aluminum alloys.

Copper.—Romania's production of refined copper in 1977 is estimated at 40,000 tons. The most important Romanian copper mines are located at Baia-Mare in the northwestern part of the country just 45 kilometers south of the Soviet-Ukranian border, including the Baia Sprie and Cavnic mines. In 1977, the low-grade copper deposits (0.3% copper) were mined at Moldova Nova and Roşia Poieni areas, which were discovered relatively recently. As reported previously, two additional mines were to be opened there, one in 1978 and another in 1979, with a combined capacity of 20 million tons of ore per year. The other copper mining area is Roşia Montana (Noua, Borsa, Balan, and Lesul Ursului mines).

One potential prospect for U.S. firms in Romania is the planned expansion of copper production. Romania's goal is to become self-sufficient in copper by 1984. Reportedly, American firms may have the advantage in both projects currently under development in Moldova Nova and Roşia Poieni. A number of firms such as Amero, Fiat-Allis, Allis Chalmers, and Pullman, have made offers of equipment sales for the project.[18]

According to the 1977 state decree, a Baia-Borsa mining enterprise was established in 1977, with headquarters in Borsa in Maramures County. This was essentially a reorganization of the Baia-Borsa mine and being subordinate to the Baia-Mare Central for nonferrous metallurgy and ores. Its main objective will be the production of nonferrous ore concentrates, geological investigations, and mine development.

Iron and Steel.—Crude steel production continued to rise and reached 11,457,000 tons in 1977. The 1977 iron ore production slipped, however, to 2,467,000 tons or 13% below the 1976 level. The three major iron ore mines, located at Hunedoara, Cluj (now renamed Napoca), and Resita, are able to produce about 3.3 million tons of ore annually. Iron ore reserves are limited and the steel industry, because of its growth, has increased its imports.

The U.S.S.R. was the major source in 1977 of Romanian imported iron ore and pig iron, as shown in the following tables:[19]

Table 5.—Romania: Imports of iron ore from the U.S.S.R.

Year	Total imports (metric tons)	Soviet deliveries of iron ore	
		Metric tons	Percentage of total Romanian imports
1975	10,878,700	6,288,000	57.8
1976	11,740,000	5,135,000	43.7
1977	12,402,200	4,599,000	37.1

Table 6.—Romania: Imports of pig iron from the U.S.S.R.

Year	Total imports (metric tons)	Soviet deliveries of pig iron	
		Metric tons	Percentage of total Romanian imports
1975	583,000	385,630	66.1
1976	560,600	343,032	61.2
1977	646,300	e369,349	57.2

eEstimate.

India is another important supplier of iron ore to Romania. Bilateral economic cooperation, including Romanian aid in constructing industrial facilities in India and the import of iron ore, actually started a number of years ago. India is supposed to supply Romania with 22 million tons of iron ore during the 1971-80 period. The 1978 imports may be from 2.5 to 10 million tons. Since the amount of iron ore imported in the last few years from the U.S.S.R. has been declining, the new agreement with India appears to make up, at least in part, for this difference.

Iron ore imports have grown from 917,000 tons in 1960 to 12,402,200 tons in 1977; pig iron imports rose from 4,000 tons in 1960 to 646,300 tons in 1977. In 1977, Romania imported almost five times more iron ore than it mined domestically. Since the current 5-year plan stipulates that steel output must go up to 18 million tons (as against 11,457,000 tons produced in 1977 and 13,724,000 tons planned for 1979), the necessary iron ore has to be supplied largely through imports.

In 1977, two continuous-casting steel mills were installed at Galati, two at Otelul Rosu, and others are planned at Galati, Hunedoara, and Calarasi. By 1980, the continuous-casting installations are to produce 3.5 million tons of steel. In 1977, a number of 2,700-cubic-meter blast furnaces were installed as well as Martin furnaces for 400-ton charges and oxygen injection.[20] The Galati enterprise employs 22,000 workers and is the largest Romanian iron and steel plant. Its construction began in 1960, and in 1977 it produced nearly 6 million tons of steel. The Galati enterprise now has five blast furnaces, four of 1,700- and one of 2,700-cubic-meter capacity. The Galati combine accounts for almost 60% of Romania's pig iron production, 47% of steel, and 92% of cold-rolled steel sheet and strip products.

Steel production at the Resita complex is expected to reach 2 million tons per year in the future. The Otelul Rosu iron and steel works of Caransebes in Caraş-Severin County produced 512,000 tons of steel in 1977.

Romanian steel output by process is presented in the following table (in thousand metric tons):[21]

Process	1975	1976	1977
Oxygen converter	3,568	4,452	4,853
Open hearth	4,768	4,798	4,895
Electric	1,213	1,483	1,709
Total	9,549	10,733	11,457

By 1980, over 70% of the steel in Romania is planned to be produced by oxygen converters and electric furnaces. Steel production in 1978 is expected to reach 12 million tons. The Galati complex is to account for 47% of the total, the Hunedoara enterprise for 30%, and that at Resita for 13%. By 1980, Romania plans to produce over 17 million tons of crude steel per year. Long-term plans call for producing 25 million tons of steel by 1990, which may be taken to mean as substantial commitments for imported iron ore.

Lead and Zinc.—Smelter output of lead in 1977 remained at 32,000 tons, and that of zinc decreased to 55,000 tons in 1977. The only Romanian lead-zinc smelter is located at Copsa Mica in central Romania and is administered by the Uzina Chimica Metallurgica.

Almost all of Romania's lead and zinc concentrate comes from the Baia-Mare mining complex, some from Balan, and several other smaller sulfide ore mines. The Baia-Mare mill feed is a low-grade ore assaying from 0.50% to 0.54% lead, 0.07% copper, and 2.10% to 2.47% zinc.[22]

NONMETALS

Among nonmetallics, Romania has a well-developed sodium products industry that is based upon an estimated 20 billion tons of reserves. Barite is mined at an annual rate of 100,000 tons at Ortra. One of the larger nonmetallic enterprises is the Cluj (Napoca) mining complex, processing such products as kaolin, feldspar, bentonite, refractory materials, quartzite, and others.

Barite.—Barite production was estimated to be 85,000 metric tons in 1977. Barite is mined at Ortra, adjacent to the Lesul Ursului copper mine in the Roşia Montana area of northwestern Romania. Most of the barite is used domestically in the oilfields. In 1977, Romania continued to import barite from the Federal Republic of Germany at

Digitized by Google

3,970 metric tons annually, which is a 2.2% increase from the previous year. In 1977, Romania was also negotiating import of barite from Thailand at 2,000 tons annually.

Cement.—Cement production in 1977 was 13.9 million tons, a 6% increase over that of 1976. By 1980, Romania plans to produce 20 million tons of cement annually. Romania again continued its steadily rising export of cement and in 1977 exported 3.1 million tons (up by 14.2% over 1976) mostly to Yugoslavia and Czechoslovakia.

Production in 1977 began at the Taşca cement plant in the Neamt district. The plant was started in 1975 and is the biggest and most technologically advanced in Romania, employing the dry method. A new lime and cement production line, with an annual capacity of 320,000 tons, was commissioned at the Tirgu Jiu building materials complex. Other plants that produce lime are located at Tiraveni and Bicaz. Romania has 12 cement plants.[23]

Fertilizer Materials.—Romania's total fertilizer production in 1977 was 1,929,000 tons (100% nutrient content), an increase of 6% over that of 1976. At the same time, over 2 million tons of chemical fertilizer was exported by Romania in 1977.

New Romanian complex fertilizer plants put into expanded operation in 1977 included a plant at the Turnu Magurele and new ammonia and urea plants at the Navodary, Craiova, and Arad. At the Bacau complex, a diammonium phosphate plant was readied for service in 1977. Other ammonia and phosphoric acid plants were also prepared for service.

Romania in 1977 imported 778,900 tons of apatite concentrate, an increase of 13.7% over the previous year and 128,500 tons of potassic fertilizer. Romania supplies almost 40% of the EEC requirements in fertilizers, especially nitrogenous.

The Romanian state agency, Romchim, plans to award the Belgian-based firm Coppee-Rust a contract to provide technical assistance for constructing two urea plants as the first stage of major fertilizer expansion program. This order will follow six other urea projects placed with Coppee-Rust, the first dating back to 1966. Construction of the two 420,000-ton-per-year units has already begun and the cost is estimated to be about $25 million each. They will be based on Stamicarbon process technology and will be similar to the 420,000-ton-per-year Bacau project that Coppee-Rust announced in December 1975.

Two gas-based ammonia plants, to provide the raw material for the urea facilities, are also being built in Romania based on Kellogg process engineering. Kellogg is responsible for supervision and some construction on the plants, each of which has a capacity of 300,000 tons per year. The urea produced from these two plants will be for export and is part of Romania's plan to more than double fertilizer nutrient output in the current 5-year plan.[24] By 1980, Romania expects to produce 4 million tons of fertilizers, thus doubling the 1977 volume. The plan emphasizes the manufacture of nitrogenous fertilizers, with production scheduled to amount to 3 million tons per year by the end of the 5-year plan.

Feldspar and Fluorspar.—Production in 1977 has been estimated at 60,000 tons of feldspar and 20,000 tons of fluorspar. Imports of those two minerals are mostly from Italy and some from the United Kingdom, ranging from 1,500 to 4,000 tons annually, depending on requirements. In 1977, negotiations were being conducted for imports of fluorspar from Thailand at quantities of up to 6,500 tons annually.[25]

Salt.—Salt production in Romania has been slightly but steadily increasing since 1975, and in 1977 it was 4.5 million tons, an increase of 7.7% from 1976. Romania exported 715,000 tons of salt in 1977 to Yugoslavia, Greece, and the Federal Republic of Germany, an increase of 7.1% over the previous year.

Romanian salt reserves are estimated at 20 billion tons, with major halite deposits and mines located in the Precarpathians in Transylvania.

Sulfur.—The production of sulfuric acid was 1,523,000 tons in 1977, a slight decline from that of 1976. Romanian plant capacity for the production of sulfur is estimated at 400,000 tons annually.[26] As reported previously, a plant was to be constructed to utilize the pyrite recovered as waste from the sulfuric acid plant located at the Turnu Magurele complex, where annual sulfuric acid production capacity was 300,000 tons per year, using the Lurgi process.

MINERAL FUELS

The Romania current 5-year plan provided for radical changes in the uses of energy resources, especially in the consumption conservation. Of the total of 7,155 megawatts of electric power to be installed in the 1976-80 period, the primary fuel to be used

Digitized by Google

in the generation of this power are to be as follows: 4,225 megawatts (59.2%) from thermal power stations using coal and oil shale as fuel; 1,743 megawatts (24.4%) from hydropower; 937 megawatts (13%) from plants fired by oil; and 250 megawatts (3.4%) from plants fueled by secondary and recovered energy resources.

The total primary energy balances for Romania for 1976-77 are shown in table 7.

Table 7.—Romania: Total primary energy balance for 1976 and 1977

(Million tons of standard coal equivalent[1])

	Total primary energy	Coal (lignite, anthracite, bituminous) coke	Crude oil and petroleum products	Natural and associated gas	Hydropower
1976:[2]					
Production	86.0	15.1	21.6	48.3	1.0
Imports	17.8	5.2	12.5	--	.1
Exports	12.6	--	12.0	.3	.3
Apparent consumption	91.2	20.3	22.1	48.0	.8
1977:[2]					
Production	85.0	15.4	21.5	46.9	1.2
Imports	18.5	5.3	13.0	--	.2
Exports	10.9	--	10.3	.3	.3
Apparent consumption	92.6	20.7	24.2	46.6	1.1

[1]1 ton standard coal equivalent (SCE) = 7,000,000 kilocalories. Conversion factors used are: Hard coal, 1.0; lignite and brown coal, 0.33; coke, 0.9; crude oil, 1.47; refinery products, 1.53; natural gas, 1.33 (per thousand cubic meters); hydroelectric power, 0.125 (per thousand kilowatt-hours).

[2]Production and trade data were taken from the Statistical Yearbook of the Socialist Republic of Romania (Bucharest), 1978.

Source: World Energy Supplies, Statistical Papers, Series J, No. 18, (United Nations) New York, 1975.

Coal.—In 1977, Romania produced 29.1 million tons of run-of-mine coal and lignite, a 4% increase over its 1976 production. The total marketable (net) coal and lignite production in 1977 was 26.8 million tons.

Romania imported coal from various countries including CMEA partners, Australia, and in 1977 from the United States. In 1977, Romania contracted to purchase 27.3 million tons of coal from the Island Creek Coal Co. in Virginia. Negotiations were also underway in 1977 between Romania and Kaiser Resources Ltd. (Vancouver, Canada), for delivery of Canadian metallurgical coal to Romania between 1978-80.[27]

Lignite makes up 70% to 80% of Romanian domestic coal production and forms the most important coal reserves (90%), located mainly in the Oltenia region (Jiu Valley), in a large basin on the southern flank of the Carpathian Mountains. Other easily mined (open cast) lignite deposits are found in the Crisana area, which would be capable of satisfying a considerable part of the energy needs. Smaller coal deposits are located in the Brasov, Arges, and Ploesti areas but are only of local importance. Geologists estimate the reserves of the Oltenia basin at more than 3 billion tons, of which about 1 billion tons are of commercial quality. The coal seams in the basin are from 1 to 12 meters thick and open cast mining is easy. The Rovinari mine is one of the main coal mines, which supplies about half of Romania's lignite output. The two other most important mines in the Oltenia region are the Motru and Jilt. The Jilt open cast mining area is considered to be potentially the country's second most important after the Jiu Valley and its biggest lignite producer. At present, the Oltenia region is already the main supplier of fuel for the large Turceni thermoelectric stations built in the area. Oltenia will become one of the most important mining regions of the country, with new names added to the already operating mines. The Cicani, Beterega, Girla, Tismana, Horesti, and Leurda are already in operation and others still in the planning stage are the Plostina, Lupoaia, and Rosiuta in the Motru area.

Anthracite and bituminous coal are mined mostly from the Jiu Valley coalfield, which is being steadily expanded.

The current 5-year plan envisages mining of 56 million tons in 1980, of which 82% are to be lignite. The increase in lignite production up to 1985 will be assured by the mines already operational (72% open cast) or still being developed, and during the period 1985-90 new production capacity (75 million tons) is to be largely accounted for by

Digitized by Google

underground mines.

Natural Gas.—Romania's natural gas production in 1977 was 35.3 billion cubic meters, which represents a decrease of 3% from that of 1976. The production of nonassociated gas was 28.8 billion cubic meters of that total in 1977.

Geologic conditions and geographic distribution of natural gas locations in Romania are very similar to those of oil. The main gas producing areas are within the Precarpathian Depression, in the vicinity of Tîrgu Mureş (Transylvania Plateau), and the Ploiesti-Craiova area (Walachia) and in the south. Romania's natural gas reserves were reestimated in 1977 at 620 billion cubic meters (280 billion in 1975) and specifically are centered around Tîrgu Mureş, Turda, Copsa Mica, and Fagares areas. At the 1975 level of demand, the supply of natural gas in Romania may last only for another 15 to 20 years.[28]

While Romania does not import oil from the U.S.S.R., trade with the U.S.S.R. is expanding. Romania plans to import approximately 1.5 billion cubic meters of natural gas from the U.S.S.R., following the completion of the Orenburg (Soyuz) pipeline sometime in 1978. Of the two other gas pipelines crossing Romania, one exports Romanian gas to Hungary and the other carries gas from the U.S.S.R. to Hungary, Romania has no rights to any of it without the U.S.S.R.'s permission.

Oil Shale.—Special attention in Romania is being paid to the exploitation of oil shale reserves to provide feedstock mostly for thermal electric power stations. Production of oil shale, with a calorific value of approximately 1,000 kilocalories per kilogram, is being planned for 1978. The output is to be on the order of 5 million tons in 1980 and 12 million tons by 1990. In 1975, Romania began the construction of its first and largest electric powerplant designed to use oil shale as fuel. The plant is located at Oravita in western Romania near the Yugoslav border. It will have a capacity of 990 megawatts and use more than 12 million tons of surface mined oil shale per year. Another thermal plant using oil shale is being planned for construction at Anina near Resita.

Romania's known deposits of oil shale are estimated at hundreds of millions of tons and future plans envisage production of over 20 million tons annually. Deposits of oil shale have recently been discovered in the Transylvanian Alps, the Apuseni Mountains, the eastern Carpathians, and the Crisul Negru Valley south of Oradea.

Petroleum.—In 1977, Romania produced 14.7 million tons of petroleum, slightly below that of the previous year. Domestic reserves of oil and natural gas are rapidly diminishing, with the output of oil and gas now declining. In 1968, Romania for the first time became a net importer of crude oil and by 1977 it imported over 8.8 million tons. The oil was supplied by Iraq, Iran, Kuwait, and Libya. Exports of petroleum products fell 14% from 7,842,200 tons in 1976 to 6,741,900 tons in 1977. Crude oil is imported not so much for domestic consumption needs as for export of processed products, such as gasoline, diesel oil, oil residues, mineral oil, asphalt, paraffin, petroleum coke, and other primary products.

Romania imports no oil from the U.S.S.R., although it is scheduled to import gas in 1978 through the Orenburg pipeline. Iran in 1977, supplied Romania with 5 million tons of oil, or 57% of total 1977 oil imports. Romanian imports from Kuwait amounted to 454 million lei, of which crude oil accounted for the largest part. Negotiations were also drafted for the construction of a $1,250 million joint Romanian-Kuwaiti petrochemical complex at Navodari. In the last few years, Romanian imports from Libya (including oil) dropped from 708 million lei in 1976 to 453 million lei in 1977. Discussions on oil cooperation between Romania and Libya started as far back as 1972, at which time unconfirmed sources reported Romanian purchases of 1.5 million tons of oil annually from Libya. No information is available on oil imports from Venezuela, even though it was discussed as far back as 1973.

In 1977, Romania began drilling in the Black Sea, using the domestically built jackup offshore drilling platform Gloria I. But commercial production from any offshore deposits that may be found will have little or no impact on the nation's oil supply before the 1980's.[29] Large-scale onshore exploration, superdeep drilling, in-fill drilling at fields, and greatly expanded use of enhanced recovery techniques (water, gas, and steam injection) have so far not provided significant production gains. The water and gas injection methods are now used in all Romanian fields. The in situ underground combustion oil recovery technique is used in Romania in Suplacu de Barcau, contributing up to 55% of the daily output.[30]

Crude oil production for 1978 is set at 15.1 million tons and 14.8 million tons for 1979, the only commodity whose target has been

Digitized by Google

lowered. Constrained by falling reserves, Romania has limited its crude production gains to about 1% per year since 1972 and instead has sharply increased imports.[31] Romanian proved crude oil reserves were estimated in 1977 at about 290 million tons. Despite efforts to increase proven reserves and to explore offshore deposits in the Black Sea, it may well be that Romania will have a sufficiency of oil for only the next 20 to 30 years.

All Romanian refineries are Government-owned and are located at Brazi, Pitesti, Sulpacu, Barcau, Borzesti, Brazov, Cimina, Darmanesti, G. Ghorghiu Dej-Onesti, Ploieşti, and Teleajen. In 1977, Romanian Romchim signed an agreement with Houdry, a western firm, to build a 180- to 200,000-ton-per-year, high-purity benzene plant. Furthermore, Romania and Kuwait have agreed in principle to a joint oil refinery, aromatics separation unit, and a cracker to be built at Navodari on the Black Sea.[32] The Ploieşti project seems to be more imminent than that planned as a joint venture for Navodari.

As part of Romania's implementation of its research and design technologies, a new industrial R & D enterprise (Metal Central) for the production of oil extraction equipment will be inaugurated on January 1, 1978. Romania is well known for the manufacture of oil and mining equipment and machinery, and it capitalizes on the export of this technology. According to its own claims, Romania is the second largest exporter of oil equipment and installations in the world (after the United States).

Nuclear Power.—Due to the diminishing oil and gas reserves, Romania is in the process of expanding construction of its nuclear powerplants, importing nuclear fuel most likely from the U.S.S.R. The construction of nuclear powerplants has been postponed, however, several times. Two plants of 500- to 600-megawatt-capacity each were to be commissioned under the 1966-75 electrification plan, while the 1971-80 electrification plan called for the construction of nuclear plants totaling 1,800- to 2,400-megawatt capacity by 1980. The first units of 600 megawatts each, however, may not be commissioned until 1981-82. In 1970, Romania signed a contract with the U.S.S.R. for the joint construction of a 440-megawatt nuclear plant by 1978, but Romania has also been negotiating with a number of western countries, primarily Canada. Negotiations with Canada for the delivery of nuclear power stations began in 1969 and are continuing since then, and an agreement was to be signed in 1977 for work on the first nuclear plant to start in 1978. The most likely locations for the planned nuclear plants will be in Olt and Cernavoda. Romanian experts predict that 20% of the electric power generated in the country in 1990 will be derived from nuclear powerplants.[33] However, due to delays in construction and financing, and because no contracts for delivery of any nuclear plants have as yet been concluded, it seems unlikely that the 1990 target will be reached.

The Mineral Industry of Saudi Arabia

By Candice Stevens[1]

The petroleum industry contributed approximately 75% to Saudi Arabia's gross domestic product (GDP), estimated at $58 billion[2] in 1977. Increased oil revenues accounted for the 18% increase over the 1976 GDP of $49 billion. More than 90% of Government revenues was derived from oil company royalties and taxes. The fiscal year 1978 budget of $31.5 billion focused on a number of long-term energy projects. Included in Government objectives were increased participation in international petroleum marketing; a master gas system for the gathering, treatment, and transmission of associated gas; construction of parallel transpeninsular oil and gas pipelines linking the eastern and western coasts; and development of the energy transportation industry, including tankers.

Saudi Arabia's second 5-year development plan (1975-79) scheduled a total expenditure of $142 billion, a major share of which was to be devoted to building up heavy industry on both coasts. Under the supervision of the Royal Commission for Jubail and Yanbu, two complete industrial cities based on hydrocarbon-processing industries were to be constructed at Jubail and Yanbu. Bechtel Saudi Arabian Co. was contracted as technical consultant for the development of Jubail, located on the eastern coast north of Dhahran. Projects included an iron and steel complex, an aluminum smelter, several petrochemical facilities, two export refineries, and a fertilizer plant. Parsons-Barsil, a subsidiary of Ralph M. Parsons Co. (United States), developed the master plan for the Yanbu complex, located on the Red Sea coast north of Jidda. Projects included a petrochemical complex, a natural gas liquids (NGL) plant, and a major petroleum refinery and terminal.

Under the second 5-year plan, the mining and quarrying sector was expected to grow about 15% to contribute approximately 10% of the 1980 GDP. Several geological mapping projects and feasibility studies were underway in 1977. Mineral resources under examination included copper deposits at Kutam, gold deposits at Mahd adh Dhahab, iron ore deposits at Wadi Sawawin, and phosphate resources at Thaniyat. Saudi Arabia in conjunction with Sudan was also initiating studies of mineral recovery from Red Sea sediments.

PRODUCTION

Arabian American Oil Co. (Aramco), which produced all Saudi oil except the output shared by Saudi Arabia and Kuwait in the Kuwait-Saudi Arabia Partitioned Zone, increased production 8% from 8.3 million barrels per day in 1976 (revised) to 9 million barrels per day in 1977. Saudi Arabia continued as the second largest oil producer in the world following the U.S.S.R. In the Partitioned Zone, Arabian Oil Co., Ltd. of Japan (AOC) and Getty Oil Co. (GOC) had a combined petroleum production of 158,000 barrels per day in 1977. Aramco's crude oil reserves were estimated at 110 billion barrels; oil reserves in the Partitioned Zone totaled 3.5 billion barrels.

Saudi Arabia produced approximately 685,000 barrels per day of refined petroleum products in 1977, 70% of which came from the Ras Tanura refinery owned by Aramco.

Digitized by Google

In addition were 33,000 barrels per day from the Partitioned Zone. NGL production increased 5.4% to approximately 70 million barrels in 1977. Other mineral products included steel semimanufactures, cement, and small quantities of nonmetals. Saudi Arabia's mineral production in 1977 is given in table 1.

TRADE

Saudi petroleum exports increased from 8 million barrels per day in 1976 to 8.7 million barrels per day in 1977. The main recipients of Saudi crude oil were Western Europe, Japan, and the United States. In 1977, Saudi Arabia supplied 15% of U.S. oil imports. Other major exports were 560,000 barrels per day of refined petroleum products and 216,000 barrels per day of NGL. Saudi Arabia continued as the world's largest exporter of NGL. Revenues from hydrocarbon exports were estimated at $40 billion in 1977.

Saudi Arabia's overall balance-of-trade surplus increased from $17.5 billion in 1976 to $18 billion in 1977 despite increased imports of goods and services. Almost 65% of Saudi Arabia's imports were basic construction materials, including cement (3 million tons) and steel (1.5 million tons). Important suppliers to Saudi Arabia were the United States (25%), Japan (18%), and the Federal Republic of Germany (11%).

The Saudi Government was to spend a total of $6.6 billion over the period 1978-82 to expand and develop the ports of Jidda, Dammam, Yanbu, and Jubail. Jidda and Dammam, which handled over 90% of total imports, were unable to cope with the upsurge in imports, which more than tripled in value since 1973. The expansion program included construction of new berths designed to raise the handling capacity of the four ports to 37 million tons annually, introduction of modern handling techniques, and development of administrative services and

Digitized by Google

facilities.

Aramco's Ras Tanura terminal, rated as the world's largest offshore facility with an export capacity of 8 million barrels of crude oil per day, underwent modernization of facilities during 1977. Construction began on an NGL terminal at Ju'aymah, which was to have an export capacity of 90,000 barrels per day of propane and 40,000 barrels per day of butane.

Saudi Arabia's crude oil exports occupied approximately one-third of total world tanker capacity. Several tanker companies were formed in Saudi Arabia to take advantage of the law giving preferential right for transport of Saudi oil to Saudi companies. Most tanker companies were joint ventures of Saudi private interests and major oil and transport companies: Saudi Maritime Co. (SAMARCO) included Mobil Oil Corp., Saudinaft Tanker Co. (STC) included Shell Oil Co, Saudi International Petroleum Carrier Co. (SIPCA) included Texaco Inc., and Saudi Arabian Shipping Co. (SASCO) included Mitsui O.S.K. Lines Ltd.

Table 2.—Saudi Arabia: Exports of crude petroleum and refinery products[1]

(Thousand 42-gallon barrels)

Commodity	1975	1976	1977

[1]Includes Saudi Arabia's one-half share of exports from the Kuwait-Saudi Arabia Partitioned Zone.
[2]Excludes exports (if any) by General Petroleum and Mineral Organization (Petromin).
[3]Includes naphtha.

COMMODITY REVIEW

METALS

The Directorate General of Mineral Resources (DGMR) continued to concentrate on basic geologic mapping and exploration for metallic minerals. In 1977, several foreign companies were involved in surveys, mapping, and exploration, primarily on the Precambrian Arabian Shield. Three types of permits were granted by the DGMR: Reconnaissance permits, which allowed the holder to import equipment duty-free; exploration licenses, which entitled the holder to have exclusive prospecting rights for up to 5 years over an area of up to 10,000 square kilometers; and mining leases, which were granted as joint ventures with the Government and included an initial tax holiday of 5 years on any producing venture.

The Bureau de Recherches Géologiques et Minières (BRGM) of France was granted its sixth 2-year contract for general mineral exploration in June. Having previously concentrated on the Hejaz area north of Jidda, the BRGM was to expand its survey to central Saudi Arabia. The U.S. Geological Survey continued its investigation of the mineral deposits of western Saudi Arabia. Hunting Surveys and Consultants Ltd. (United Kingdom) was contracted in October for a land survey and mapping of 330,000 square kilometers in Eastern Province. Rio Tinto Finance & Exploration Ltd. (Riofinex), a subsidiary of Rio Tinto-Zinc Corp. Ltd. (United Kingdom), was con-

tracted to provide an overall commercial survey of the feasibility of exploiting known mineral occurrences in Saudi Arabia.

The Saudi-Sudanese Commission for the Exploitation of Red Sea Resources planned to spend $17 million in 1978 on experimental dredging of Red Sea brines. The metal-bearing sediments on the Red Sea floor were estimated to contain 5.8% zinc, 0.9% copper, and 3.5 troy ounces of silver per ton. Sampling indicated approximately 50 million tons of metalliferous bottom sediments. Preussag AG (Federal Republic of Germany was to conduct overall feasibility studies on seabed mineral exploitation. The BRGM was to act as technical consultant to the project.

Copper.—Noranda Mines Ltd. (Canada) continued its feasibility study on exploitation of the Kutam copper deposits in the south near the Yemeni border. Exploratory work has shown mineralization for 450 meters along the strike zone and 250 meters in depth. Drilling indicated one mineralized zone 66 meters wide containing between 2.04% and 4.12% copper.

Arabian Shield Development Co. proceeded with its diamond drilling program at the Al Masani copper-zinc deposits to the north of Kutam. Exploration began at this location in 1971, with drilling commencing in 1974. The mineralized zone was traced to

Digitized by Google

the south for about 5 kilometers with an average thickness of 30 meters. Samples from the Al Masani deposit assayed 0.01 to 0.22 troy ounce gold and 0.55 to 1.29 troy ounces of silver per ton, 1.79% to 2.13% copper, and 4.00% to 8.59% zinc.

No decision was reached regarding the exploitation of copper deposits at Jabal Sayid, located between Mecca and Medina. Feasibility studies were completed by Soc. d'Études de Recherches et d'Explorations Minières (SEREM) and United States Steel Corp. Reserves were estimated at 8 million tons averaging 2.2% copper, 1.4% zinc, and 1.29 troy ounces of silver, and 0.02 troy ounce of gold per ton.

Gold.—Gold Fields Mahd adh Dhahab Ltd. (GFMAD), a Consolidated Gold Fields Ltd. subsidiary, was to complete the second stage of its exploration program at Mahd adh Dhahab in mid-1978. The Mahd adh Dhahab gold mines, located 300 kilometers northeast of Jidda, were worked at two periods during ancient times, and during modern times from 1939 to 1954 by Saudi Arabian Mining Syndicate Ltd. Preliminary estimates of remaining reserves indicated 6 million tons of ore containing 0.2 troy ounce of gold and 0.8 troy ounce of silver per ton.

Iron and Steel.—British Steel Corp. initiated its 4-year study of the Wadi Sawawin iron ore deposits located in northwestern Saudi Arabia near the Gulf of Aqaba. Its $15 million contract was for an economic feasibility study on exploitation of the deposits. Reserves at Wadi Sawawin were estimated at 350 million tons averaging 42% iron. Two other iron ore deposits have been identified in Saudi Arabia. Reserves at Wadi Fatimah, located south of Jidda, were estimated at 50 million tons averaging 45% iron. Reserves at Jebel Idsas in central Saudi Arabia were estimated at 6 million tons averaging 69% iron.

A major iron and steel complex was planned for the industrial city at Jubail. A feasibility study for the plant, to begin production in 1982, was being prepared by Korf Stahl AG (Federal Republic of Germany). Approximately 800,000 tons per year of sponge iron was to be produced by the Midrex direct-reduction process using natural gas. Saudi Arabian Basic Industries Corp. (SABIC) was to hold a majority interest in the venture.

Nickel.—The Wadi Qatan nickel deposit in southwestern Saudi Arabia was under investigation by Arabian Shield Development. Preliminary results of diamond drilling indicated an average value of 1.5% nickel on a small outcrop. In 1977, Arabian Shield Development applied for an exploration license to prospect on 1,000 square kilometers of land surrounding the Wadi Qatan nickel deposits and the Al Masani copper-zinc deposit.

NONMETALS

Cement.—Saudi Arabia's cement production capacity was rated at 1.5 million tons per year. In 1977, Saudi Arabia consumed about 5 million tons of cement, 73% of which was imported. To meet a projected annual cement demand of 10 million tons by 1980, Saudi Arabia planned extensions to existing facilities and construction of five new plants. Current capacity was concentrated in three plants, as follows:

Operator	Location	Capacity (thousand metric tons per year)
Arabian Cement Co. Ltd	Jidda	700
Yamama Saudi Cement Co. Ltd	Riyadh	400
Saudi Cement Co	Hofuf	400

Klöckner-Humboldt Deutz AG (Federal Republic of Germany) was contracted by Yanbu Cement Co. for a 1-million-ton-per-year plant at Yanbu and by Quassim Cement Co. for a 730,000-ton-per-year plant at Quassim-Buredah. Two Japanese firms, Ishikawajima-Harima Heavy Industries Co., Ltd. (IHI) and Nichimen Co., Ltd. were to construct a 2-million-ton-per-year plant at Abqaiq for Saudi-Bahraini Cement Co. Saudi-Kuwaiti Cement Co., owned 55% by Saudi Arabia and 45% by Kuwait, was to undertake construction of a 2-million-ton-per-year plant in the Partitioned Zone. Jidda Cement Co. planned to begin construction on a 1-million-ton-per-year plant at Rabigh in 1978.

Fertilizer Materials and Sulfur.—Owing to improved maintenance and plant modifications, the Saudi Arabian Fertilizer Co.

Digitized by Google

(SAFCO) plant had a record high production in 1977 of 152,000 tons of ammonia, 220,000 tons of urea, and 9,700 tons of sulfuric acid. The Petromin Sulfuric Acid Plant was acquired by SAFCO in January. In September, SAFCO settled its dispute with Occidental Petroleum Corp. regarding compensation for the takeover of the SAFCO facilities. Almost all production of the SAFCO fertilizer complex, located in Dammam, was exported to India and Pakistan. Production of sulfuric acid was to be increased to 200 tons per day to meet rising demand from domestic chemical industries and desalination units.

Saudi Chemical Processing Co., a joint venture of Lebanon Chemicals Inc. and Saudi Research and Development Corp. Ltd. (REDEC), was to construct a 700,000-ton-per-year triple superphosphate plant to begin production in 1981. The plant, to be located near the Gulf of Aqaba, would initially process phosphate from Jordan and later from the Thaniyat deposits in Saudi Arabia.

Phosphate.—The Swedish firm Gränges AB continued its feasibility studies of phosphate deposits in the northwestern corner of the country. Reserves were estimated at 242 million tons of phosphate grading 24% P_2O_5. Beneficiation studies conducted during the year indicated that the phosphate could be upgraded to 68% P_2O_5. For exploitation, a joint mining company was to be formed between the Saudi Government and Gränges on a 50-50 basis. Gränges planned to extend its drilling program to West Thaniyat near the Jordanian border in 1978.

Gypsum.—Saudi Arabia produced approximately 20,000 tons of gypsum in 1977 for use by local construction industries. Gypsum was quarried on the Red Sea coastal plain at Al Kabrit and Al Magnah.

Salt.—Salt was produced by solar evaporation in several localities along the Red Sea coast. Surveys indicated large amounts of bedded rock salt in the south and salt in evaporites underlying the coastal plain near Jidda. No plans were made to exploit the Jizan salt domes, south of Jidda, which were estimated to contain 33 million tons of 96% pure sodium chloride.

MINERAL FUELS

Natural Gas.—Saudi Arabia's natural gas reserves were estimated at 85 trillion cubic feet, consisting almost exclusively of associated gas. Natural gas production was estimated at 4.7 billion cubic feet per day, 80% of which was flared. The remainder was used for oilfield reinjection, fuel for local industries, or NGL producton. In 1977, facilities at Abqaiq and Ras Tanura produced 26,000 barrels per day of propane, butane, and natural gasoline for export. Aramco, which operated Saudi Arabia's gas-gathering system, continued exploration for natural gas in Rub' al Khali.

Aramco's gas-treatment system was expanded with the commissioning of the Berri NGL center in November 1977. Associated gas from the Ghawar, Ain Dar, Abqaiq, Qatif, and Berri Fields was gathered into collection centers at Abqaiq and Berri, where it was separated into NGL. The NGL output was then piped to the fractionation and treatment plant at Ras Tanura. At yearend, Aramco facilities had a production capacity of 320,000 barrels of NGL per day, approximately 75% of which was to be exported.

The processing capacity of the major gas-gathering system under construction by Aramco for the Government was reduced from 6 billion cubic feet to 4 billion cubic feet per day of associated gas. Gas was to be processed at centers located in Shedgum, Uthmaniyah, and Ju'aymah and then transported over 4,000 kilometers of pipeline to storage units, fractionating plants, refineries, and export terminals. The $14 billion system was to produce 500,000 barrels per day of NGL for export, 300 barrels per day of ethane to be used as feedstock for petrochemical industries, 1.4 million barrels per day of methane for use as fuel and feedstock, and 4,000 tons per day of sulfur. In 1977, work proceeded on the NGL centers at Shedgum and Uthmaniyah. The entire system was scheduled to be in operation by 1984.

Petrochemicals.—Saudi Arabia, through SABIC, entered into joint ventures for construction of six petrochemical complexes as follows:

Digitized by Google

Joint venture partner	Location	Product	Capacity (thousand metric tons per year)
Mobil Oil Corp	Yanbu	ethylene	450
PECTEN Arabian Ltd	Jubail	do	656
Dow Chemical Co	do	do	400
Exxon Corp	do	polyethylene	240
Mitsubishi Gas Chemical Co., Inc., and Japanese consortium	do	methanol	730
Celanese Chemical Co./Texas Eastern Corp	do	do	730

The projects were to be 50-50 ventures between SABIC and its foreign partners. Financing responsibilities were to be divided among the Government (60%), the equity partners (30%), and other sources (10%). Foreign partners were to receive a 5-year tax holiday and crude oil entitlements. Ethane and methane feedstock for the petrochemical complexes was to come from the gas-gathering system under construction by Aramco. The first ethylene complex, that of SABIC/PECTEN, was due onstream in 1982.

Petroleum.—*Production.*—The Government reduced the production ceiling of Aramco from 10.5 million barrels per day in 1977 to 8.5 million barrels per day in 1978. In addition to Aramco's output is production by GOC and AOC, operating onshore and offshore, respectively, in the Partitioned Zone shared with Kuwait. The Government also directed that the output of Arabian Light crude should not exceed 65% of total crude oil production in 1978.

Negotiations for the full takeover of Aramco by the Government continued to be in the final stages in 1977. Under a general accord reached in 1976, Aramco was to change from a concessionaire company to a service company operating in the oil sector as well as in other sectors such as gas exploitation, electrification of Eastern Province, and certain industrial ventures. Aramco would continue to operate and market the bulk of petroleum production, with buying companies receiving crude oil in previous proportions. Petroleum exploration was to be conducted by the companies with their own risk capital; bonuses, fees, and crude oil entitlements were to be received for successful results. At yearend, ownership of Aramco remained with the Government 60%, Exxon Corp. 12%, Texaco 12%, Standard Oil Co. of California 12%, and Mobil 4%.

A $1 billion pressure-maintenance program was to boost petroleum production capacity in Aramco's fields from 11 million barrels per day in 1977 to 14 million barrels per day in 1980. This program included a new saltwater injection system to commence operation in 1978. The Aramco concession covered 222,000 square kilometers and comprised 37 major oilfields, 15 of which were in operation in 1977. The Ghawar Field, rated as the world's largest oilfield, produced approximately 5 million barrels per day of petroleum in 1977. The Zuluf and Marjan Fields were reactivated in 1977 with the construction of one onshore and two offshore gas-oil separation plants and two major pipelines.

Refining.—Petroleum-refining capacity in Saudi Arabia in 1977 was 785,000 barrels per day concentrated in five facilities, as follows:

Company	Location	Startup date	Capacity (thousand barrels per day)
Arabian American Oil Co. (Aramco)	Ras Tanura	1945	600
Getty Oil Co. (GOC)	Mina Saud	1958	100
Arabian Oil Co., Ltd. (AOC)	Ras al-Khafji	1966	30
General Petroleum and Mineral Organization (Petromin)(SARCO).	Jidda	1968	40
Petromin	Riyadh	1975	15

Digitized by Google

General Petroleum and Mineral Organization (Petromin) planned expansion of its two refineries and entered into joint ventures for construction of new refining and lubricating oil facilities. The Jidda refinery, owned 75% by Petromin and 25% by Saudi Arabian Refinery Co. (SARCO), was to be expanded from 40,000 barrels to 210,000 barrels per day. The Riyadh refinery was to be expanded from 15,000 barrels to 100,000 barrels per day.

Petromin entered into three joint ventures for construction of petroleum refineries in the new industrial centers of Jubail and Yanbu. Petromin (50%), Standard of California (25%), and Texaco (25%) were to construct a 125,000-barrel-per-day refinery in Jubail. Two 250,000-barrel-per-day refineries were to be constructed, one in Jubail by Petromin (50%) and Shell (50%) and one in Yanbu by Petromin (50%) and Mobil (50%). The refineries were to produce naphtha, gas oil, high- and low-sulfur fuels, jet fuels, and lubricating oil base stocks. Exports were destined primarily for the United States, Western Europe, and Japan.

The Jidda lubricating oil refinery, owned 70% by Petromin and 30% by Mobil, was to begin production in early 1978. Constructed by Kellogg International Corp., the facility was to produce 1 million barrels per year of lubricating oil base stocks, which were previously imported. Petromin Lubricating Oil Co. (Petrolube), also located in Jidda, was to be expanded from a 75,000-barrel-per-year to a 500,000-barrel-per-year blending capacity. Petrolube was also a joint venture of Petromin (70%) and Mobil (30%).

Pipelines.—Aramco completed and put into service 645 kilometers of major hydrocarbon pipelines during 1977. Contracts were awarded for construction of Saudi Arabia's two transpeninsular pipelines to carry crude oil and NGL from Eastern Province to Yanbu on the western coast. Each pipeline would be approximately 1,200 kilometers in length. The crude oil pipeline, to be constructed under the direction of Mobil Overseas Pipeline Co., would carry 1.85 million barrels per day of oil from the Ghawar and Khurais Fields to the projected Yanbu refinery and for export from Red Sea ports. The NGL pipeline, to be constructed under the direction of Gulf Interstate Overseas Co., would carry 250,000 barrels per day of propane, butane, and natural gasoline to Yanbu to be used as feedstock at the planned petrochemical complex and for export.

The Mineral Industry of Sierra Leone

By Candice Stevens[1]

Sierra Leone has experienced slow growth rates in recent years owing to the decline of the mineral sector and the consequent erosion of the country's export base. The closure of the Marampa iron ore mines and the decline in diamond production reduced the contribution of the mineral sector to about 20% of Sierra Leone's gross national product (GNP), estimated at $550 million[2] in 1977. The country's financial situation has deteriorated owing to rising import costs, reduced exports, and a growing Government budget deficit. Sierra Leone's external debt was estimated at $160 million; in 1977, the Government and the International Monetary Fund reached an agreement for credit and foreign exchange support. Sierra Leone maintained a policy of acquiring 51% ownership in all new mining ventures.

Expansion of the mineral sector was to be assisted by improved infrastructure. A network of all-weather roads linking Freetown, the capital, with the provincial capitals and the principal diamond areas was recently completed. The Mano River Union, formed by Sierra Leone and Liberia for economic cooperation, was to undertake improvements in the highway link between Freetown and Monrovia. Construction began in 1977 on a large hydroelectric plant on the Sewa River near Bumbuna. A loan from the International Bank for Reconstruction and Development (IBRD) was to finance improvements in the Freetown electric power generating grid. In 1977, the Government signed a management contract with West African Port Management International (United Kingdom) for overall supervision and upgrading of the Sierra Leone Port Authority.

PRODUCTION AND TRADE

Diamond production declined and bauxite production increased in 1977, Sierra Leone also produced small amounts of nonmetallic minerals and refined petroleum products. Production of iron ore ceased in 1975 owing to the liquidation of Sierra Leone Development Co., Ltd. (DELCO). Rutile production was expected to commence in 1978. Mineral production in Sierra Leone is given in table 1.

In 1977 agriculture displaced the mineral sector as the largest contributor to Sierra Leone's export earnings. The termination of iron ore exports and the decline in diamond exports decreased mineral sector revenue from 70% to 40% of total export value. Although world prices for agricultural products increased significantly and the unit values of diamond and bauxite were higher than in 1976, the balance-of-trade deficit was approximately $25 million owing to the continued high level of imports.

Diamond production was sold to the Central Selling Organization, Diamond Corp. of West Africa Ltd. (DICORWAF), and a small number of licensed buyers. In late 1977, the Government reduced diamond export duties from 7.5% to 2.5% to make legal diamond sales more profitable and reduce smuggling.

Digitized by Google

All bauxite was exported unprocessed, principally to Switzerland, the Netherlands, and Canada. Refined petroleum products were exported primarily to Liberia. Overall, the United Kingdom remained Sierra Leone's principal trading partner, supplying 25% of total imports and taking 60% of total exports in 1977.

Table 1.—Sierra Leone: Production of mineral commodities

Commodity[1] and unit of measure	1975	1976	1977[p]
Aluminum, bauxite, gross weight thousand metric tons	655	651	745
Diamond:			
Gem thousand carats	[e]560	433	352
Industrial do	[e]840	650	448
Total do	[e]1,400	1,083	800
Iron ore, gross weight thousand metric tons	1,454	--	--
Petroleum refinery products:			
Gasoline thousand 42-gallon barrels	797	231	331
Kerosine do	56	185	199
Jet fuel do	201	109	101
Distillate fuel oil do	304	407	464
Residual fuel oil do	--	423	824
Liquefied petroleum gas do	61	3	10
Refinery fuel and losses do	--	29	6
Total do	1,419	1,387	1,935

[e]Estimate. [p]Preliminary.

[1]In addition to the commodities listed, a variety of crude construction materials (clays, sand and gravel, and stone) are also produced, but quantities are not reported and available general information is inadequate to make reliable estimates of output levels. Gold production may also occur, but data are not available for estimating production. Sierra Leone annually refines 4,000 to 10,000 metric tons of salt from imported crude marine salt, but this is not included in the body of the table because it would represent a double counting of materials credited to the country where salt was originally collected.

COMMODITY REVIEW

METALS

Aluminum.—Production of bauxite by Sierra Leone Ore and Metal Co. (SIEROMCO), a wholly owned subsidiary of Alusuisse of Switzerland, was approximately 745,000 tons in 1977. SIEROMCO has mined bauxite in the Mokanji Hills near Moyamba in southwestern Sierra Leone since 1963. Reserves in this region were estimated at 70 million tons of ore containing 47% Al_2O_3 with 4.5% SiO_2. It was confirmed in 1977 that the Sierra Leonean Government would not acquire partial ownership of the Mokanji mine but would increase the taxes and royalties paid by SIEROMCO until 1978 when mining leases were to expire and would be renegotiated.

In 1977, the Sierra Leonean Government and Alusuisse concluded an arrangement for the exploitation of bauxite deposits at Port Loko. The Government was to have a 50% share in the operation and would receive taxes and royalties after an initial 5-year tax holiday. Reserves at Port Loko were estimated at 60 million tons containing 50% Al_2O_3. The mine was to produce 1 million tons of bauxite annually. Alusuisse was also to initiate feasibility studies for an associated alumina refinery with an annual capacity of [500,000] tons.

Iron Ore.—DELCO mined the Marampa iron ore deposits in Port Loko District from 1933 to October 1975 (during which production rose from 24,000 tons to 1.5 million tons), when Sierra Leone joined the Association of Iron Ore Exporting Countries (AIOEC). Agreement was reached in 1977 with the liquidators of DELCO whereby the Sierra Leonean Government would purchase all of DELCO's assets for $1.3 million and would subsequently waive all claims against the liquidators. Negotiations continued between the Government and Bethlehem Steel Corp. (United States), which was considering reopening the Marampa mine and exploiting iron ore reserves at Tonkolili as a joint project.

Titanium Minerals.—Production of rutile at Gbangbama in Moyamba District by Sierra Rutile Ltd. (SRL) was expected to begin in mid-1978. SRL, a joint venture of Bethlehem Steel (85%) and Nord Resources Corp. (15%), invested nearly $50 million in the development of the project, which was to produce between 100,000 and 125,000 tons of rutile annually. Reserves were estimated at 187 million tons of black sands containing 3 million tons of rutile. SRL acquired the Gbangbama leases from Sherbro Miner-

Digitized by Google

als Ltd., which was liquidated in 1971 after preliminary development of the project. Work continued in 1977 on construction of a new dredge and concentrating plant, powerplant enlargement, machine and electrical shop extensions, and rehabilitation of the mine camp.

A joint subsidiary of the West German firms Bayer A.G. and Preussag Metall A.G. continued exploratory drilling in the region of Bradford and Rotifunk for titanium minerals. Bayer-Preussag acquired a 5-year exclusive prospecting license in a 6,700-square-kilometer area of Southern Province in 1974. Approximately 20,000 tons of raw material was extracted for treatment and evaluation at a pilot plant constructed in their rutile concession in 1976.

NONMETALS

Diamond.—Diamond production in 1977 again declined to a low of approximately 800,000 carats. National Diamond Mining Co. (DIMINCO), which accounted for the major share of diamond production, suffered severe production declines in recent years owing to the exhaustion of alluvial reserves. Two processing plants were closed in 1977, and several hundred workers were put out of work. DIMINCO initiated prospecting in new areas in southern Sierra Leone, but development of additional reserves would require extensive capital investment. DIMINCO was created in 1970 when the Government purchased 51% of Sierra Leone Selection Trust Ltd., a subsidiary of Consolidated African Selection Trust. In 1977, DIMINCO mined lower grade deposits in its two concession areas in the Yengema region of Kono District and the Tongo region south of Yengema. One-half of DIMINCO's production was sold to DICORWAF, a subidiary of De Beers Consolidated Mines Ltd.; five licensed buying firms received fixed percentages of the remainder of output.

The balance of diamond production was under the Alluvial Diamond Mining Scheme (ADS), established in 1956 to discourage illicit digging. Licenses were issued to Sierra Leonean nationals or to firms holding a Sierra Leonean majority for individual diamond digging in 23,000 square kilometers of designated area outside the DIMINCO concessions. The ADS provided jobs for about 40,000 diggers, who for the most part recovered diamond by primitive hand-panning methods.

MINERAL FUELS

Petroleum.—Sierra Leone Petroleum Refining Co., whose refinery opened in Freetown in 1976, produced over 1.9 million barrels of refined petroleum products in 1977. Crude oil was imported primarily from Nigeria. The refinery was jointly owned by the Sierra Leonean Government and five oil companies: British Petroleum Co. Ltd., Texaco Inc., Shell Oil Co., Mobil Oil Corp., and Agip S.p.A. Approximately 20% of production was exported. Exploration for petroleum in offshore Sierra Leone was minimal in 1977; most prospecting licenses had been allowed to expire because previous exploration had yielded no commercial petroleum or natural gas deposits.

The Mineral Industry of the Republic of South Africa

By Miller W. Ellis[1] and Charles W. Sweetwood[2]

The mining industry made a substantial contribution to the economy of the Republic of South Africa during 1977, and industries based on mineral products supported the country's position as the leading commercial and manufacturing nation of the African continent. Mineral products accounted for more than 17% of the gross domestic product (GDP) and more than half of export sales. Both the quantity and value of local mineral sales increased substantially, and the value of mineral imports (excluding petroleum) decreased 31.6% in conformity with the Government's program of selective imports of essential ores, concentrates, and metals. At current prices the value of mineral products exceeded $6 billion for the first time, contributing a total of $6.61 billion (R5.75 billion)[3] to a GDP of $38.23 billion (R33.24 billion) in 1977, compared with $5.38 billion (R4.68 billion) (revised) of the 1976 GDP of $33.37 billion (R29.02 billion). The value of mineral production increased nearly 23%, while the GDP increased 14.5% above the 1976 record. The quantity of mineral exports in 1977 was more than double that of 1976, largely owing to the increased facilities for bulk loading of iron ore and coal at the new ports of Saldanha Bay and Richards Bay, respectively, but the total value of mineral exports increased by less than 25%. Because of the Government's selective policy, imports of mineral commodities decreased 50% in quantity and 32% in value.

Expansion programs in both the Government-controlled and privately owned mineral industries continued on or ahead of schedule during 1977. The Government-controlled South African Iron and Steel Industrial Corp., Ltd. (ISCOR) operated the new ore-loading terminal at Saldanha Bay throughout the year, and the South African Coal, Oil and Gas Corp., Ltd. (SASOL) completed development of its new Secunda Colliery and accelerated construction at the SASOL II oil-from-coal plant. The flexibility of Government policy of providing incentives to stimulate investment in mining was demonstrated by negotiations with De Beers Consolidated Mines Ltd. for more favorable leasing arrangements and reduced taxes, contingent on additional capital for deeper development work at the Premier diamond mine.

PRODUCTION

The Republic of South Africa continued to lead the world in production of chromite, gem diamond, gold, platinum, vanadium, and vermiculite, and was one of the top three producers of antimony, asbestos, industrial diamond, manganese, and uranium. Facilities at the new Saldanha Bay and Richards Bay ports provided capacity for increased production of iron ore and coal to be exported. Important quantities of cement, copper, fluorspar, phosphate, salt, tin, and zinc were produced for export as well as to supply domestic industries. Production of gold and manganese ore declined, but production of gem and industrial diamond, platinum-group metals, silver, chromite, fluorspar, and many of the country's other mineral commodities increased during 1977. Details of mineral production are shown in table 1.

Gasoline	thousand 42-gallon barrels	31,939	29,783	30,083
Jet fuel	do.	3,144	2,196	2,349
Kerosine	do.	3,400	3,132	3,338
Distillate fuel oil	do.	30,220	31,279	31,918
Residual fuel oil	do.	29,454	22,027	22,036
Lubricants	do.	2,171	2,228	2,262
Other	do.	7,715	8,581	8,607
Refinery fuel and losses	do.	6,651	5,561	5,624
Total	do.	114,694	104,787	106,217

[e]Estimate. [p]Preliminary. [r]Revised.
[1]Less than 1/2 unit.
[2]Data include osmiridium from gold ores estimated at 2,500 troy ounces annually.
[3]Local sales plus exports. Production not reported.

TRADE

The Republic of South Africa continued to be a major source of mineral products for the industries of Western Europe, Japan, and the United States. Exports of chromium, fluorspar, asbestos, platinum, uranium, vanadium, and zirconium all showed significant increases. Coal shipments doubled, and iron ore was exported at nearly three times the 1976 rate. Gold continued to provide a large share of the country's foreign exchange, but both gem and industrial diamonds made substantial contributions. The country's industrial, railway, and port facilities continued to contribute to the importance of the mineral industries of other countries of Southern Africa. Crude oil and alumina were major mineral imports. Details of exports from and imports to the Republic are shown in tables 2 and 3, respectively. Table 4 compares the value of exports and local sales for 1976 and 1977.

Table 2.—Republic of South Africa: Exports of selected mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976
METALS			
Aluminum metal, unwrought[2]	13,900	13,700	20,400
Antimony ore and concentrate, gross weight	22,530	12,247	18,115
Beryllium, beryl concentrate, gross weight	--	15	--
Chromium:			
Chromite ore and concentrate, gross weight:			
Chromium oxide content 44% or less[3]	489,086	473,603	366,372
Chromium oxide content over 44% to 48%[3]	291,676	433,648	231,103
Chromium oxide content over 48%[3]	73	--	50
Total	780,835	907,251	597,525
Chromite sand, gross weight:			
Chromium oxide content 44% or less[3]	9,146	40,480	203,060
Chromium oxide content 44% to 48%[3]	272,486	301,674	393,698
Chromium oxide content over 48%[3]	--	--	--
Total	281,632	324,154	[3]596,758
Copper:			
Ore and concentrate, metal content[2 4]	17,000	19,500	23,600
Blister and anode[2]	65,400	61,700	69,400
Refined[2]	26,200	37,600	45,600
Iron and steel:			
Iron ore, gross weight:			
Hematite[e 3] thousand tons	2,119	2,523	3,663
Magnetite[3 e] do.	775	814	550
Total do.	2,894	3,337	4,213
Scrap[5] do.	([e])	6	3
Pig iron[5] do.	179	1	1
Sponge iron and powder[5] do.	19	16	31
Ferroalloys:			
Ferrochromium[5]	194,800	283,700	340,600
Ferromanganese[5]	346,900	276,000	330,300
Ferrosilicon[5]	40,100	36,100	59,600
Other[5]	38,800	34,100	41,700
Total	620,600	629,900	772,200
Ingots and other primary forms[5]	[r]100,400	31,300	182,800
Semimanufactures:[5]			
Bars and rods	71,100	27,100	131,600
Angles, shapes, sections	65,600	45,300	106,600
Plate and sheet	286,400	170,900	459,900
Hoop, strip, coil	28,100	5,100	9,800
Rails and accessories	31,600	20,600	14,000
Wire	8,500	5,600	10,300
Tubes, pipes, fittings (including cast pipe)	15,700	12,400	16,700
Castings and forgings	4,900	5,400	3,900
Total	[r]511,900	[r]292,400	752,800
Lead, unwrought metal[2 5]	31,900	27,100	16,700
Manganese ore, gross weight:			
Metallurgical[e 3]	3,020,892	3,401,376	3,446,435
Chemical[e 3]	710	1,327	215
Manganiferous[e 3]	116,859	237,684	295,350
Total[e 3]	3,138,461	3,640,387	3,742,000
Nickel, unwrought[e 3]	14,434	17,895	19,200
Platinum-group metals, metal including alloys, all forms[e 3] thousand troy ounces	1,679	1,831	NA
Tin concentrate	1,768	2,273	1,768
Vanadium materials, V_2O_5 equivalent	11,600	--	12,885
Zinc:			
Concentrates, gross weight	39,422	66,706	86,048
Metal, unwrought[2]	--	3,000	7,000
Zirconium, baddeleyite ore and concentrate	6,256	4,102	NA
NONMETALS			
Asbestos:			
Amosite	90,109	173,165	66,978
Anthophyllite and/or tremolite	484	1,406	818
Chrysotile	71,669	112,415	81,056
Cape blue	159,029	257,273	170,412
Transvaal blue	610	--	--
Total	321,901	544,259	319,264

Table 2.—Republic of South Africa: Exports of selected mineral commodities[1] —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	1976
NONMETALS —Continued			
Cement[e] thousand tons	354	343	--
Clay and clay products:			
Bentonite:			
Crude	1,675	1,595	1,786
Processed	101	158	20
Fire clay, calcined	--	--	--
Flint clay:			
Raw	678	2,443	8,911
Calcined	149,729	114,319	77,977
Fuller's earth	21	--	--
Kaolin:			
Crude	1,804	114	--
Milled	240	490	--
Washed	91	30	117
Feldspar	3,558	1,878	3,247
Fertilizer materials (phosphate rock):			
Ore	7,000	--	--
Concentrate	30,097	13,229	11,118
Fluorspar:			
Acid grade	111,382	126,061	178,479
Ceramic grade	--	39	28,845
Metallurgical grade	12,206	454	8,591
Total	123,588	126,554	215,915
Gem stones (emerald crystals) kilograms	1,963	1,045	900
Graphite (processed)	954	434	--
Gypsum	10,165	14,069	11,400
Kyanite and related materials:			
Andalusite	18,759	23,773	16,357
Sillimanite	18,737	16,524	12,960
Lime, slaked and other	41,902	41,809	39,612
Mica:			
Waste	2,535	510	244
Ground	2,037	2,542	932
Pigments, mineral:			
Ochers	1,601	896	607
Oxides	183	22	10
Salt	10,133	6,770	19,596
Stone, sand and gravel:			
Dimension stone:			
Granite:			
Sawn slabs	6,915	5,660	14,066
Raw blocks	305,813	225,746	207,409
Marble cubic meters	4,887	2,097	3,141
Quartzite:			
Tiles	935	5,046	780
Other	20	16	--
Limestone	18,867	10,092	6,854
Slate:			
Dust	--	--	478
Tiles	2,618	2,221	2,490
Other	665	190	1,612
Silica:			
Crude	186	40	5
Processed	1,231	497	381
Sulfur, pyrites, sulfur content	--	--	--
Talc and related materials:			
Talc and steatite	214	116	--
Wonderstone (pyrophyllite)	5,335	3,367	3,834
Vermiculite	149,665	185,943	187,416
MINERAL FUELS AND RELATED MATERIALS			
Coal:			
Anthracite thousand tons	1,035	1,122	4,431
Bituminous do	1,245	1,565	1,530

[e]Estimate. [r]Revised. NA Not available.

[1]Because official South African trade statistics provide data only on the total value of exports of each commodity class (no data on quantity and no data on destinations), this table has been compiled from several sources and includes some estimates. All information not individually footnoted is from the quarterly publication "Minerals" issued by the Department of Mines of South Africa (various issues 1974-78). Figures from other sources and Bureau of Mines estimates are individually footnoted.

[2]World Bureau of Metal Statistics. World Metal Statistics, October 1979. London, 1979, 112 pp.

[3]American Consulate General, Johannesburg, Republic of South Africa. Various airgrams.

[4]Includes exports from the Territory of South-West Africa (Namibia) in source publication; no basis is available for distribution of this total between the Republic of South Africa and the Territory of South-West Africa.

[5]United Kingdom Iron and Steel Statistics Bureau. International Steel Statistics - Republic of South Africa. Issues for 1974, 1975, 1976, 1977, and 1978, except data for individual types of ferroalloys for 1977 are Bureau of Mines estimates.

[6]Less than 1/2 unit.

Table 3.—Republic of South Africa: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite	32,130	13,248	Austria 6,884; Denmark 4,680.
Oxide and hydroxide	140,499	165,347	Mainly from Austria.
Metal including alloys:			
Scrap	356	875	United States 369; West Germany 198.
Unwrought	1,264	633	United Kingdom 160; Japan 111.
Semimanufactures	12,284	9,410	United States 4,166; Belgium-Luxembourg 1,050.
Arsenic:			
Oxides and acids	105	90	Mainly to United Kingdom.
Metal	2	17	NA.
Chromium:			
Chromite	80,070	167,125	NA.
Oxide and hydroxide	296	326	West Germany 110; U.S.S.R. 62; United States 25.
Cobalt oxide and hydroxide	16	12	Canada 10.
Copper:			
Ore and concentrate	11,076	8,827	Mainly from Austria.
Metal including alloys:			
Scrap	369	709	United Kingdom 77.
Unwrought	4,221	3,776	NA.
Semimanufactures	5,966	3,940	United Kingdom 1,086; West Germany 1,029.
Gold metal, unworked or partly worked troy ounces	9,196	8,533	United Kingdom 4,884; Switzerland 1,037; West Germany 1,017.
Iron and steel:			
Ore and concentrate	8,244	2	NA.
Metal:			
Scrap	18,022	34,261	NA.
Pig iron, ferroalloys, similar materials	48,530	87,940	Sweden 2,744; Norway 925.
Steel ingots and other primary forms	144,227	10,892	Japan 1,027; United Kingdom 276.
Semimanufactures:			
Bars and rods	54,609	15,049	United Kingdom 7,131; West Germany 1,548.
Angles, shapes, sections	50,641	5,705	United Kingdom 2,371; Belgium-Luxembourg 1,607.
Plates and sheets	399,884	47,441	Japan 32,510; West Germany 4,101.
Hoop and strip	13,935	8,830	Japan 2,609; West Germany 667.
Rails and accessories	181,167	43,194	West Germany 29,913.
Wire and wire rod	15,888	10,423	Japan 1,916; West Germany 1,637.
Tubes, pipes, fittings	68,509	112,117	Japan 25,890; West Germany 13,343.
Castings and forgings, rough	4,176	4,128	United Kingdom 1,222; Belgium-Luxembourg 514.
Total	788,809	246,887	
Lead:			
Ore and concentrate	1,004	5,766	Mainly from Australia.
Metal including alloys:			
Scrap	8,299	12,744	Canada 6,843; United States 2,554.
Unwrought	3,297	5,009	NA.
Semimanufactures	68	36	NA.
Magnesium metal including alloys, all forms	576	539	United States 268.
Manganese:			
Ore and concentrate	83	311	United Kingdom 203.
Oxides	1,323	3,870	Mainly from Belgium-Luxembourg.
Mercury 76-pound flasks	2	1	All from Spain.
Molybdenum metal including alloys, all forms	24	18	Mainly from Australia.
Nickel metal including alloys, all forms	2,450	1,784	United Kingdom 378; Japan 120.
Platinum-group metals including alloys, all forms troy ounces	71,392	16,804	United States 6,299; West Germany 3,472.
Silicon and tellurium	60	14	Mainly from United Kingdom.
Silver:			
Waste and sweepings troy ounces	5,168	35,619	United States 17,014; West Germany 2,028.
Metal including alloys, all forms do.	4,000,070	1,599,714	Mainly from West Germany.
Tin:			
Oxides	14	16	Mainly from United Kingdom.
Metal:			
Scrap	23	86	NA.
Unwrought and semimanufactures	898	850	NA.
Titanium (ilmenite):			
Ore and concentrate	3	221	Mainly from Australia.
Oxides	71	209	Belgium-Luxembourg 87; West Germany 82.
Tungsten:			
Ore and concentrate	422	341	Mainly from Brazil.
Metal including alloys, all forms	33	13	West Germany 5; United Kingdom 2.

Table 3.—Republic of South Africa: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Zinc:			
Ore and concentrate	20,704	22,095	Canada 15,464; Australia 4,930.
Oxides	386	396	West Germany 148; United Kingdom 144.
Metal including alloys:			
Scrap including powdered dust	306	320	Canada 36.
Semimanufactures	59	34	West Germany 18.
Zirconium, ore and concentrate	49	232	Australia 274.
Other:			
Ore and concentrate:			
Molybdenum, tantalum, vanadium	76	34	All from United States.
Other base metals, n.e.s	2,884	2,226	Mainly from Australia.
Ash and residue containing nonferrous metals	9,610	22,915	United Kingdom 6,186; Australia 4,557; West Germany 3,351.
Oxides, hydroxides, peroxides of metals, n.e.s	346	515	Mainly from United States.
Elemental boron, phosphorus, and selenium	104	83	United Kingdom 42.
Metal including alloys, all forms:			
Alkali, alkaline-earth, rare-earth metals	2,118	1,919	NA.
Pyrophoric alloys	7	6	West Germany 2.
Base metals including alloys, all forms, n.e.s	585	404	United Kingdom 227.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	6,331	491	NA.
Grinding and polishing wheels and stones	570	439	United Kingdom 124.
Asbestos	28,560	30,428	NA.
Barite	2,718	2,685	West Germany 562; Israel 482; United Kingdom 305.
Boron materials and crude natural borates	467	450	Turkey 250; United States 150.
Bromine	6	6	West Germany 5.
Cement	70,307	73,754	Belgium-Luxembourg 9,953; West Germany 1,290.
Chalk	6,827	3,680	France 2,683; United Kingdom 512.
Clays and clay products:			
Crude clays and refractory minerals	16,234	26,943	United Kingdom 11,827; United States 10,250.
Products:			
Refractory	30,298	21,458	West Germany 5,802; United States 5,161.
Nonrefractory	2,779	3,284	NA.
Cryolite and chiolite	90	131	Denmark 118.
Diamond:			
Gem carats	83,000	40,000	United Kingdom 22,000; Belgium-Luxembourg 7,500.
Industrial thousand carats	9,044	6,709	United Kingdom 5,743.
Diatomite and other infusorial earth	8,745	4,922	United States 4,077.
Feldspar, leucite, nepheline syenite	95	135	NA.
Fertilizer materials:			
Crude:			
Nitrogenous	NA	23	NA.
Phosphatic	1,810	74	NA.
Potassic	249,809	205,279	West Germany 47,908; Canada 29,901; Spain 21,963.
Other	1,534	260	NA.
Manufactured:			
Nitrogenous	94,217	47,419	Italy 35,750; Netherlands 3,301.
Phosphatic	375	9,425	Mainly from United States.
Potassic	22,402	11,613	West Germany 2,100; Canada 500.
Other including mixed	1,086	866	Netherlands 516; Belgium-Luxembourg 240.
Graphite, natural	894	480	Norway 282; Sri Lanka 60.
Gypsum and plasters	5,616	5,826	West Germany 4,098; Spain 990.
Lime	1,389	4,762	France 3,693.
Lithium minerals not further described	2,273	5,880	NA.
Magnesite	137,568	103,814	Italy 11,940; Japan 9,378; United Kingdom 4,314.
Mica:			
Crude, including splittings and waste	423	773	NA.
Worked, including agglomerated splittings	50	58	United Kingdom 25.
Pigments, mineral:			
Natural, crude	536	705	Austria 575; United Kingdom 93.
Iron oxides, processed	2,364	4,294	West Germany 2,364.
Precious and semiprecious stones, except diamond value, thousands	$2,059	$5,093	Ireland $422; West Germany $83.
Pyrite	31	47	NA.
Salt	48,491	46,496	Australia 45,309.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	58,633	38,801	West Germany 16,022; United Kingdom 12,971.
Caustic potash	1,228	704	West Germany 327; France 146.
Stone, sand and gravel:			
Crude and partly worked:			
Calcareous	1,282	881	Italy 643; Israel 76; Portugal 73.

See footnotes at end of table.

COMMODITY REVIEW

METALS

Aluminum.—The Republic of South Africa continued to import all its bauxite and alumina. Nearly 155,000 tons of alumina came from the Alusuisse operation near Gove, Australia, to the Richards Bay refinery of Alusaf (Pty.) Ltd., owned 35% by the Government's Industrial Development Corp. Ltd. and 20% by Alusuisse. Alusaf produced 74,100 tons of aluminum as liquid metal and ingots, and its adjacent affiliate, Alustang (Pty.) Ltd., produced redraw rod and solid sector aluminum for electric cable. Alusaf's ingot prices increased from $1,216 per ton to $1,282 per ton f.o.b. Richards Bay in 1977. Approximately half Alusaf's ingot production was sold to Huletts Aluminium Ltd. (Hulamin) at Pietermaritzburg in Natal, which produced flat and coil sheets, extruded shapes, cable, and aluminum paste for paint. In September 1977 Hulamin commissioned a $28.8 million sheet mill to produce approximately 4,000 tons of thin sheet aluminum per year. Hulamin's gross income increased from $72 million in 1976 to about $87 million in 1977

Digitized by Google

and was expected to reach nearly $100 million in 1978.

Imports of aluminum metal products, mostly from the United States, decreased from 10,918 tons in 1976 to 8,047 tons in 1977. Japan and the United Kingdom were the principal suppliers of some 5,000 tons of abrasive and activated alumina. Most of the country's requirements of 24,000 tons of raw and activated bauxite for the chemicals, refractories, and abrasives industries came from Australia, and Denmark and Italy supplied approximately 1,000 and 1,500 tons, respectively. In October 1977, a new private sector company, South African Bauxite Ltd., was investigating low-grade bauxite deposits near Weza, 150 kilometers west of Durban.

Antimony.—All of the country's antimony production continued to come from seven mines operated by Consolidated Murchison Ltd. (CML) located along the Murchison Range, north and northwest of the Palabora copper mine. Ore and concentrate production increased from 642,800 and 18,341 tons, respectively, in 1976 to 671,900 and 20,053 tons in 1977. The sharp decline in exports of concentrate from 18,115 tons in 1976 to 8,452 tons in 1977 was attributed to the increased manufacture of service-free automotive-type storage batteries that use antimony-free lead. Domestic sales of antimony increased from nearly 6,000 tons in 1976 to more than 8,000 tons in 1977, much of which was sold to the Antimony Products (Pty.) Ltd. (APL) plant on CML property at Gravelotte in northern Transvaal. The APL plant, jointly owned by CML, Chemtron Corp. of Chicago, and Johannesburg Consolidated Investment Co. Ltd., has the capacity to produce 3,265 tons of crude antimony oxide annually and manufactures a fire retardant, largely for export. CML reported favorable results from preliminary tests of a pilot plant to produce high-purity antimony sulfide concentrate from the previously unsalable high-arsenic portion of CML's concentrate and ore.

Chromite.—Production of chromite increased 38% from 2.4 million tons in 1976 to 3.3 million tons in 1977. Domestic sales increased 38% in quantity and nearly 61% in value, while export quantity rose more than 50% with a value increase of nearly 110% to more than $45 million. Estimates indicated a slight decrease in exports of chrome sand, a small increase in local sales, and a 21% increase in export value to more than $27.5 million. In line with the general increase in world market prices, the average value realized for chromite exports increased 36% from $36 per ton in 1976 to $49 per ton in 1977.

The South African Railways and Harbors Administration (SAR&H) and the country's 16 chromite producers advanced a loan to the Mozambique Government early in 1977 to purchase new bulk-loading equipment for the port of Maputo. Technical and managerial expertise was also provided, and by the end of March, South African chromite was moving smoothly through the port. The converted, privately owned, grain-loading facility at Island View in Durban harbor was utilized for chrome sand outloading. With both ports operational, the industry was able to handle enhanced export orders following the repeal of the Byrd Amendment in March 1977.

Copper.—The depressed world market prices and rising operating costs during 1977 did not seriously affect the South African copper industry. Ore production increased 7.3% over that of 1976, and the output of concentrate and metal rose 5.8%. Exports increased 10% in quantity and 33.5% in value, but domestic sales declined nearly 25% from 62,048 tons in 1976 to 46,655 tons in 1977. Imports of metal were deliberately reduced 69% from 11,724 tons in 1976 to only 3,601 tons in 1977. The O'okiep Copper Co. Ltd., near Springbok in northwestern Cape Province, suffered considerable financial loss during 1977 and by July 1 announced curtailment of development work, a production cut of 27%, and a 35% reduction in work force. Priska Copper Mines Pty. Ltd., jointly owned by the Anglo Transvaal Consolidated Investment Co. Ltd. and U.S. Steel Corp., managed to maintain operating costs and increase overall production, largely because of improved profits from its zinc and pyrite coproducts. Messina Transvaal Development Co. Ltd. decreased production at their mines in the northern Transvaal and drew on accumulated reserves in order to show a share dividend at yearend.

The Palabora Mining Co. Ltd's (PMC) open pit operation in the northeastern Transvaal reported a financially satisfactory year with sales of 104,231 tons of refined copper at an average c.i.f. price of $1,274 per ton ($0.58 per pound) and an average production cost of $1,090 per ton ($0.50 per pound). Byproduct magnetite, sulfuric acid,

Digitized by Google

vermiculite, zirconium, uranium, and precious metals added more than $22 million to the company's gross sales. PMC was unable to achieve its targeted 30,000 tons of increased copper output. Installation of two large autogenous mills was completed in March 1977, but cracking of the revolving shells caused them to be stopped for extensive repair in mid-July for more than 2 months. Subsequent halts for inspection and additional repairs caused the loss of additional milling capacity and resulted in an estimated shortfall of 6,600 tons of copper during 1977. An additional loss of 5,000 to 6,000 tons of copper was predicted for late 1978-early 1979, when new shells are scheduled to be delivered and installed. Unusually heavy rains in February 1977 flooded the deeper (higher grade) part of the open pit for 36 days and were partly responsible for the lower average grade of ore during 1977. An oxygen plant was commissioned at PMC's smelter to increase the concentrate throughput and anode output. Concentrate purchased and smelted on toll from other producers accounted for 2,414 and 17,104 tons of anode copper, respectively. An extensive rectification program improved the deteriorating current efficiencies in the refinery during the latter part of the year. Domestic demand for copper wirebar and continuously cast rod was low during 1977, and most of PMC's production was exported as cathode.

Nearly 90 million tons of material, including almost 25 million tons of ore with 0.52% copper, was mined and hauled at PMC's open pit during 1977, more than 307,000 tons of concentrate containing 109,503 tons of copper was produced, and the smelter output of 126,037 tons of anode copper included 19,518 tons derived from concentrate purchased or treated on a toll basis. Refinery output increased 55% from 81,939 tons of cathode copper in 1976 to 126,681 tons in 1977, including nearly 20,000 tons refined as "toll."

The PMC operations are summarized in the following tabulation, in metric tons unless otherwise specified:

	1976	1977	Change (percent)
Ore and waste mined	79,287,000	89,480,000	+12.9
Ore milled	19,627,000	24,864,000	+26.7
Copper content of ore	107,950	129,292	+19.8
Concentrate produced	257,244	307,248	+19.4
Copper content of concentrate	94,450	109,503	+15.9
Anodes from PMC concentrate	93,360	106,519	+14.2
Anodes from concentrate purchased	2,304	2,414	+4.8
Anodes from toll concentrate	10,223	17,104	+67.3
Total anodes smelted	105,888	126,037	+19.0
PMC cathodes refined	71,501	106,698	+49.2
Other cathodes refined	10,438	19,983	+91.4
Total cathodes refined	81,939	126,681	+54.6
Precious metal in slimes	11.85	16.16	+36.4
Magnetite produced	563,808	449,789	-20.2
Vermiculite produced	222,079	165,420	-25.5
U_3O_8 in calcine	143.28	88.66	-38.1
Zirconia concentrate	7,490	8,715	+16.4
Zirconium chemicals	1,109	2,302	+107.6

Significant amounts of copper were recovered as byproducts of phosphate, platinum, and gold mining. On May 11, 1977, Phelps Dodge Corp. (PDC) announced an agreement with Gold Fields of South Africa Ltd. (GFSA) to develop the Aggeneys copper-lead-zinc deposit in northwestern Cape Province, previously held by the Black Mountain Mineral Development Co., a PDC subsidiary. In October the PDC holding was reduced to 49% with 51% held by GFSA. Cost of the mine and plant was estimated at $208.2 million for startup in 2 to 3 years to produce 1,125,000 tons of ore annually, with a recovery of some 22,000 tons of copper concentrate, 132,000 tons of lead concentrate, 35,000 tons of zinc concentrate, and 3.6 million ounces of silver. Copper reserves of this deposit are included in table 5, which shows ore reserves of the four major copper producers for 1977.

Gold.—Despite substantial increases in operating costs, the gold mines of the Republic of South Africa continued to produce nearly 60% of the world's gold. Although gold production declined 2% from 22.9 million troy ounces in 1976 to 22.5 million troy ounces in 1977, the reported value of gold produced increased 18% from $2,737 billion in 1976 to $3,237 billion in 1977. Gold mines of the Witwatersrand near Johannesburg produced 22,063,320 troy ounces (686,246.1 kilograms), mines in the Barberton district to the northeast accounted for 49,081 troy ounces (1526.6 kilograms), the Orange Free State tailings retreatment plant produced 10,365 troy ounces (322.4 kilograms), and 379,121 troy ounces (11,792 kilograms) came from small mines or was recovered as by-products from platinum, base metal, and phosphate ores. Production for 1976 and 1977 and proven reserves of major mines or companies are shown in table 6.

[2]Freddies Consolidated was sold to Free State Geduld Mines Limited during the fourth quarter, 1977. Production and reserve statistics are included in Free State Geduld reports.
[3]Data may not add to totals shown; however, they are as reported in "Source."

Source: Chamber of Mines of South Africa. Analysis of Working Results. October and December 1977.

Most of the mines produced their own bullion containing approximately 88% gold, 10% silver, and 2% base metals, in bars weighing between 800 and 870 troy ounces (25 to 27 kilograms, 55 to 60 pounds). The Rand Refinery at Germiston assayed and purchased the bars on behalf of the South African Government Reserve Bank, and payment was made to the producer within 5 days of the bars receipt, on the basis of the official gold price of $42.22 per troy ounce plus a premium to equal the world average monthly sales price. The refinery, with an annual capacity of 1,000 tons of gold and 100 tons of silver, produced 996 fine gold for coinage, 999 fine gold for industry and the arts, electrolytically refined silver, and platinum-group metals. The International Gold Corp. Ltd. (Intergold) arranged for gold sales to manufacturers, wholesalers, and retailers of gold products throughout the world. Sales of Krugerrand coins containing 1 troy ounce of gold increased about 10% over the 1976 sales to a total of 3,331,344 coins. About 1.5 million of these coins were sold during the final quarter of the year, when the International Monetary Fund auctioned nearly 1.6 million troy ounces of its gold reserve and the market price increased from $155 to $164 per troy ounce.

Several of the older Witwatersand gold mines ceased operations during 1977, but development work was accelerated at GFSA's Deelkraal mine and at the Anglo American Corp. Ltd. (AAC) Elandsrand mine, both near Carltonville, southwest of Johannesburg. Deelkraal's No. 2 shaft reached its final depth of 1,891 meters (6,145 feet) at the end of June, and a 113-meter section at its base was enlarged to accommodate underground headgear for a subvertical shaft from that location. The mine's uppermost ore horizon, with a gold content of 0.675 troy ounce per ton, was intersected at a depth of 1,857 meters. Deelkraal's estimated ore reserve was reported at 45 million metric tons at an average grade of 0.334 troy ounce per ton.

Elandsrand's main shaft was developing below the Ventersdorp contact reef at a depth of 1,921 meters (6,243 feet), and its second shaft cut the same reef at 2,044 meters (6,633 feet) in August. The capital cost of the operation was revised from $115 million to $159 million to commence production in 1979 instead of 1981 as originally scheduled. Ore reserves were estimated at 66 million tons, containing an average of 0.379 troy ounce of gold per ton. Surface installations and infrastructure were well advanced at both operations.

AAC's Joint Metallurgical Production Scheme to treat tailings (as well as certain concentrates) from six mines in the Welkom area of the Orange Free State Province, southwest of Johannesburg, commenced recovery of uranium in March and of pyrite in

Digitized by Google

July, mostly from Free State Saaiplaas material. By yearend, recovery of 10,365 troy ounces of gold and 312.75 tons of U_3O_8 was reported. The East Rand Gold and Uranium Co. Ltd. (ERGO) plant, under construction by AAC to recover gold, uranium, pyrite (for sulfuric acid), and copper from 16 or more abandoned tailings and slimes dams east of Johannesburg, was scheduled to commence operations in 1978 after an investment of $161 million, and to produce about 225,000 troy ounces of gold, 200 tons of U_3O_8, and 530,000 tons of sulfuric acid annually for some 20 years.

Iron and Steel.—Domestic demand for iron and steel products declined as the production capacity of both Government and privately owned producers increased. Exports of iron ore and of ferroalloys increased substantially, but a general decline in construction activity was reflected in diminished local sales and imports of rolled and drawn products. ISCOR operated at about 80% of its rated capacity and produced 84% of the country's liquid and pig iron and more than 75% of its steel products, but reported a net loss of $56.5 million, the largest in 4 consecutive deficit years. South African Manganese Amcor Ltd.'s (SAMANCOR's) major share of ferroalloy production was cut to about 40% of the country's output as two new producers commenced exporting ferrochrome in 1977.

Iron Ore and Concentrate.—Hematite ore production, principally from the Sishen area, increased more than 75% from 12.2 million tons in 1976 to 21.4 million tons in 1977. Exports via the new Sishen-Saldanha railway and ore-loading installations at Saldanha Bay increased 200% in quantity and 248% in value, from 3.7 million tons worth $54 million in 1976 to 11.0 million tons worth $189 million in 1977. Domestic sales of hematite increased 11% in quantity and nearly 44% in value, from 8.5 million tons valued at $26.1 million in 1976 to 9.5 million tons worth $37.5 million in 1977. Although magnetite ore production increased 43% from 3.5 million to 5.0 million tons during 1977, exports of magnetite from Palabora decreased 20% from 550,000 to 440,000 tons, partly because of delays in transport to and loading at the Mozambique port of Maputo (formerly Lorenco Marques).

ISCOR has invested $1.2 billion in developing a new mine at Sishen in northern Cape Province, constructing 861 kilometers (535 miles) of heavy-duty, automated railroad with the capacity to transport 14 million tons of ore annually, and building a modern ore-loading port at Saldanha Bay 125 kilometers north of Capetown. The bay had an area of 52 square kilometers (20 square miles), was 30 meters deep in shipping lanes, and had a 3.6-kilometer (2.2-mile) causeway and loading jetty to accommodate four 150,000-deadweight-ton or two 350,000-deadweight-ton ore carriers simultaneously. Loaders were installed for one vessel at a rate of 8,000 tons per hour, but provision was made for additional loaders when required. Nearly 50 acres were prepared for stockpiling and reclaiming 2.4 million tons of different ore types or sizes, and provision was made for expansion to 10 million tons of stockpiles. On April 1, 1977, the rail line and port facilities were transferred to SAR&H. ISCOR was to receive a cash payment of $132.3 million and remained responsible for operating losses for 25 years. SAR&H was to assume ISCOR's capital commitment of $621 million.

Ferroalloys.—Highveld Steel and Vanadium Corp. Ltd. continued as the country's largest private producer of specialty steel and alloys, and reported a record net profit of $38.1 million out of a turnover of $166.2 million for its fiscal year ending June 30, 1977. Southern Cross Steel Co. (Pty.) Ltd. and Palmiet Chrome Corp. (Pty.) Ltd., both Barlow Rand subsidiaries, also reported profitable operations for 1977. Southern Cross was the country's only producer of stainless steel, and Palmiet discontinued production of low-carbon ferrochrome in favor of charge chrome and high-carbon ferrochrome. SAMANCOR operated 11 furnaces at its Metalloys subsidiary and 4 furnaces at its Ferrometals unit near Witbanks, Transvaal. Another 75-MVA furnace was planned for 1978 commissioning at the Metalloy plant in Meyerton at a cost of $46.0 million. SAMANCOR's 1977 production reportedly included 190,344 tons of ferromanganese, 78,010 tons of ferrochrome, and 43,686 tons of ferrosilicon. Consolidated Metallurgical Industries Ltd. (CMI), a subsidiary of Johannesburg Consolidated Investment Co. Ltd. (Johnnies), poured its first charge of ferrochrome in April 1977 and made its first shipment in October from the first of its three 40,000-ton-per-year furnaces at Leydesburg in the Transvaal. Tubatse Ferrochrome (Pty.) Ltd. commissioned the first of its three 40,000-ton-per-year (30-MVA) high-carbon ferro-

Digitized by Google

chrome furnaces on May 18, 1977. The second unit was operational by yearend, and the third was scheduled to be run-in during 1978. General Mining and Finance Corp. Ltd. owned 51% of Tubatse with Union Carbide as minority partner and manager of the modern, low-cost, pollution-free plant to produce charge chrome for export using ore from General Mining's Groothoek and Hendriksplaats chromite mines, 16 kilometers from Lydenburg.

Although there was no direct U.S. involvement in South Africa's steel industry, Foote Mineral Co., a Newmont subsidiary, had an interest in Silcon Smelters (Pty.) Ltd. of Pietersburg, Transvaal; Union Carbide was involved at Tubatse (see above), and in vanadium with UCAR South Africa, at Brits, Transvaal; and Koppers is interested in "black" products from ISCOR's coke ovens. Reported production of ferroalloys in metric tons is shown in the following tabulation:

	1976	1977
Ferrochrome	238,520	226,179
Ferromanganese	469,060	444,457
Ferrosilicon	115,220	109,164
Ferrovanadium	300	300
Total	823,100	780,100

Manganese.—The Republic of South Africa remained the world's second largest producer of manganese (after the U.S.S.R.) and the free world's largest exporter. Total manganese production declined nearly 4% from 5.5 million tons in 1976 to 5.0 million tons in 1977 because diminished demand for metallurgical grades of ore resulted in curtailment of mine production in the second half of the year. Increases of 25% in the cost of electrical power and 20% in railroad freight rates for export ore came into effect during 1977. Export and domestic sales of metallurgical-grade ores decreased slightly in both quantity and value. Virtually all export ore continued to be transported 800 kilometers by rail for dispatch from Port Elizabeth, where stockpiling and loading facilities formerly used for iron ores were underutilized after the Sishen-Saldanha railroad was commissioned in 1976. Most of the major manganese mines in the 65-square-kilometer Postmasburg field were associated with the hematite ores of the Sishen-Postmasburg area and its northern extension, the Kuruman or Kalahari field, where generally higher-grade ores have been found along a strike length of about 60 kilometers extending towards the Botswana border. In both fields the manganese ore occurred in one or more gently folded or dipping beds ranging from 6 to 30 meters in thickness. The ore generally contained a maximum of 0.05% phosphorus and 0.03% sulfur. At SAMANCOR's large Wessels underground mine, production capacity was increased from 300,000 to 500,000 tons per year by commissioning a second inclined shaft and by improvements to the crushing and sizing plant. Shaft sinking started in February 1977 at AAC's new Middelplaats underground mine, downdip and west of the Mamatwan open pit. Production of approximately 1 million tons per year of plus 38% manganese ore was scheduled for 1979.

The purchase of the Gopane mine in Bophuthatswana near Zeerust, Transvaal, by the Rand London Manganese Mines (Pty.) Ltd. was confirmed in July 1977, and the new owners opened the recently completed Mangope shaft. The Gopane mine, previously owned by General Mining's Marble Lime and Associated Industries Ltd., was an underground producer of battery-grade (plus 65% MnO_2) ore and held a long-term contract to supply uranium-grade (plus 40% MnO_2) ore to the Rossing uranium mine in Namibia, owned by Rio Tinto Zinc Corp. Ltd. and others.

The South African Geological Survey revised its estimates of manganese resources to 300 million tons at more then 40% Mn, 2,000 million tons between 30% and 40% Mn, and 5,000 million tons between 20% and 30% Mn.

Nickel.—Electrolytically refined nickel was a byproduct of the country's platinum-group metals, and production increased about 2.5% to a record 21,955 tons in 1977. Most of the production was exported to captive buyers in Norway, Canada, the United Kingdom, and the United States. Export values increased by about 10.9% for some 19,694 tons of metal, but the value of domestic consumption (mostly by the stainless steel industry) declined 5.7% compared with that of 1976.

Platinum.—Although published figures were not available, it was estimated that production of platinum-group metals increased about 6.3% to 2,870,000 troy ounces in 1977 from 2,700,470 troy ounces in 1976, accounting for nearly 50% of world production. Because of the high platinum-

Digitized by Google

palladium ratio of its ores, the country's production of platinum metal at 1,809,000 troy ounces was the world's highest. Virtually all of the production came from four companies operating on the Merensky Reef in the Transvaal's renouned Bushveld Igenous Complex. Ore production increased from 14.2 million tons in 1976 to 15.1 million tons in 1977. On October 19, 1977, the Atok Platinum Mines (Pty.) Ltd., owned by Anglovaal, U.S. Steel Corp., and others, was taken over by the Rustenburg Platinum Mining Co. Ltd. in return for 1.9 million Rustenburg shares worth approximately $2.5 million. The Atok property was within the Lebowan Homeland; the Impala Platinum Mines (Pty.) Ltd. and part of the Rustenberg properties were within the boundaries of the new Bophuthatswana Homeland, which became independent on December 6, 1977.

A small part of the country's platinum-group metal production was recovered from Palabora Copper Mines tankhouse slimes, and the Witwatersrand gold mines continued to produce some 6,000 troy ounces of osmium and iridium, the hardest and heaviest of the platinum-group metals.

Tin.—Evidence of ancient tin smelting was discovered in the Cape Province in the late 1800's, and a number of ancient tin workings in the Transvaal Province have been examined since the discovery of the Rooiberg tinfields in 1905. A comparison of production from the three modern tin mining companies for 1976 and 1977 follows, in metric tons:

Company	1976		1977	
	Ore	Concentrate	Ore	Concentrate
Rooiberg Minerals Development Co. Ltd	132,451	3,739	135,437	4,563
Union Tin Mines Ltd	33,876	1,628	34,333	1,268
Zaaiplaats Tin Mining Co. Ltd	74,006	258	73,500	308
Total	240,333	5,625	243,270	6,139

Union Tin Mines Ltd. of GFSA continued, but did not complete cleanup operations during 1977. The delay in phasing out the operation, scheduled because of declining ore grade, was probably due to increased tin prices. Rooiberg's production increased and the company commenced construction of a 2,000-ton-per-year tin smelter near its "A" concentrator on the Olievenbosh property. The capital cost was reported at about $2.1 million and the startup was scheduled before the end of 1979.

Zaaiplaats continued to operate the country's only tin smelter and reported the production of 582 tons from its own ore and custom smelting during 1977. Zaaiplaats' production was all consumed by local industry, and some 1,239 tons of tin metal was imported, an increase of 34% over the 928 tons reported for 1976.

Uranium.—Uranium production in the Republic of South Africa continued, largely as a byproduct of the gold-mining industry. Production of U_3O_8 increased 21.7% from nearly 3,255 tons in 1976 to 3,962 tons in 1977, with estimated increases in export quantity and value of 29% and 49%, respectively, from 2,604 tons worth $70.3 million in 1976 to 3,368 tons valued at $104.4 million in 1977. Table 7 shows the 1976 and 1977 production of U_3O_8.

Table 7.—Republic of South Africa: Production of U_3O_8

(Kilograms)

Company or mine	1976	1977
Blyvooruitzicht	131,064	199,949
Buffelsfontein	606,800	653,200
Harmony	497,208	535,820
Free State Saaiplaas	0	45,545

Table 7.—Republic of South Africa: Production of U_3O_8 —Continued

(Kilograms)

Company or mine	1976	1977
Vaal Reefs	1,012,997	1,016,955
West Driefontein	227,186	295,567
Western Deep Levels	140,001	167,410
West Rand Consolidated	147,478	265,559
Anglo American OFS Joint Metallurgical Scheme	0	312,750
Palabora Copper	143,277	88,661
Total	3,254,643	3,962,456

Although AAC's Joint Metallurgical Treatment Scheme officially started in the Orange Free State Province on August 3, 1976, and uranium recovery did not commence until March 1977, the uranium produced accounted for 44% of the increase in total uranium production during the year. AAC's ERGO project to treat abandoned slimes and tailings from Transvaal mines east of Johannesburg was scheduled to be in full production in 1978 and to produce 200 tons of uranium per year.

Except for Palabora, all uranium production was sold through the Nuclear Fuels Corp. (NUFCOR), a consortium of major South African companies, and marketed by the Chamber of Mines of South Africa. In July 1977, NUFCOR reportedly negotiated a contract for the Compagnie Generale des Matières Nucleaires (a subsidiary of the French Atomic Energy Authority) to buy 900 tons of U_3O_8 worth $52.9 million annually from Randfontein Estates for a 10-year period starting in 1980. The sliding-scale price was initially pegged at $26.80 per pound of U_3O_8. An interest-free loan of $103.5 million supported by the French Atomic Energy Authority was to finance refurbishing of Randfontein's Cooke plant at Millsite near Johannesburg. Engineering services were to be under the joint management of Johannesburg Consolidated Investment Co. Ltd. (Johnnies) and the Bechtel Corp. of the United States.

In May 1977, the Government's Uranium Enrichment Corporation (UCOR) announced that its Helikon enrichment process had proved sucessful in pilot plant operation, and that it was ready to discuss enrichment service contracts for 1986-87. UCOR's full-scale production plant was targeted for the production of 5,000 tons per year of enriched uranium fuel using uranium hexafluoride as feedstock and an aerodynamic process similar to the West German jet-nozzle development. The cost was estimated at $1.4 billion, and the percentage of the more highly fissionable uranium-235 isotope would be increased from its natural 0.7% to 3.5% of its predominantly uranium-238 content. A "profitable" selling price of $74 per kilogram of enriched product was reportedly about 25% lower than prices discussed elsewhere in the world for mid-1980's enrichment contracts.

In November 1977, Dr. Ampie Roxu, President of South Africa's Atomic Energy Board, predicted that uranium mines with gold as a byproduct would be developed on the Witwatersrand deposit in the Orange Free State. Three major companies were known to be drilling in this area. Union Corp. Ltd. located sufficient uranium near the Harmony mine to support at least one full-scale operation, with ore containing about 0.25 kilogram of U_3O_8 and 0.161 troy ounce of gold per ton. AAC was drilling on an adjoining property and at another site near Welkom, and GFSA was reportedly drilling near Union. Exploration also continued in the Karroo Basin of Central Cape Province.

Vanadium.—The Republic of South Africa continued to be the world's largest producer of vanadium and the source of more than half the free world's supply. Economically recoverable vanadium reserves were considered to be the largest known and were revised by the country's Geological Survey to a total of 232 million tons of ore containing 1.5% to 2.0% V_2O_5 to a depth of less than 100 feet in the magnetite ores of the Bushveld Igneous Complex. Production in 1977 increased 14% to 20,061 tons of V_2O_5, compared with 17,628 tons in 1976. Exports increased 6% in value from R49.7 million to R52.6 million during the same period, while local sales tripled in quantity and value. Highveld Steel and Vanadium Corp. Ltd., the country's (and the world's)

Digitized by Google

leading vanadium producer, curtailed production at its 12,000-ton-per-year plant during the last half of the year and was reportedly operating at only 70% of capacity in December 1977. Ucar Minerals Corp. Ltd. of Union Carbide, S.A. Ltd., operated its plants at Brits and Bon Accord, near Pretoria, at full capacity during 1977 but indicated that production would be cut in 1978. The Otavi Mining Co. Ltd. mine, operated by Transvaal Alloys (Pty.) Ltd., and its 1,500-ton-per-year plant at Wapadskloof, 100 kilometers northeast of Middleburg in northern Transvaal Province, were reportedly expected to expand operations if export sales to West Germany and to the Taiyo Koko company of Japan continued to improve.

Zinc.—Anglovaal's Prieska Copper Mines (Pty.) Ltd. (PCM), at Copperton, 65 kilometers southwest of Prieska, continued to be the country's only zinc producer in 1977. Prieska's concentrate production declined 7.1%, from 149,922 tons at 52.4% zinc in 1976 to 139.262 tons at 51.3% zinc in 1977. Export sales under contract to Metallgesellschaft in West Germany declined 30.8% in quantity and 37.6% in value. Increases of 36.8% in quantity and 24.5% in value were reported in domestic sales to GFSA's Zinc Corp. of South Africa Ltd. (ZINCOR), which reported a 14.6% increase in production of electrolytically refined zinc to a record 75,965 tons in 1977, partly from concentrate imported from Canada. On May 11, 1977, PDC announced agreement with GFSA for the development of the Aggeneys copper-lead-zinc deposit in northwestern Cape Province, previously held by PDC's subsidiary Black Mountain Mineral Development Co. Ltd. Ore reserve at the Aggeneys deposit was estimated at 38 million tons containing 0.45% copper, 6.25% lead, 2.87% zinc, and 0.08% silver in proved ore, with 162 million tons of probable ore at similar grades. In October it was announced that GFSA would manage and hold 51% of the operation, and PDC's holding was reduced to 49%. More than $208 million was to be invested in the mine and plant with a capacity to produce 1,125,000 tons of ore and to recover 20,000 tons of copper concentrate, 132,000 tons of lead concentrate, 35,000 tons of zinc concentrate, and 2.6 million ounces of silver annually. Production was to start in 2 to 3 years. Newmont Mining Corp. and AAC anounced that development of their lead-zinc deposit at Gamsberg near Springbok in Cape Province was to be postponed. The capital cost was estimated at $195.5 million.

NONMETALS

Asbestos.—The Republic of South Africa was a major producer and exporter of three different types of asbestos and was virtually the only source for the crocidolite and amosite varieties. Most of the U.S. consumption was chrysotile asbestos imported from Canada. Overall production of asbestos in the Republic increased by 2.8%, while exports rose 5.3% in quantity and 19% in value. Cape Blue crocidolite production increased 12.7% from 178,411 tons in 1976 to 201,056 tons in 1977, while amosite production declined 15% from 78,898 tons to 66,983 tons, mostly during the last 6 months of 1977. Chrysotile asbestos becomes brittle at about 650° C (1,200° F) but is readily decomposed by acid, tends to pack when wet or shaken, and is generally inferior to the other varieties for certain uses. Crocidolite asbestos from the Cape Province has a high percentage of long fibers of high tensile strength. It is acid resistant, but the fibers become brittle at about 360° C (680° F). Amosite is similar to crocidolite in tensile strength and spinnability and becomes brittle at a higher temperature. It is unsurpassed in fiber length, is resistant to both acids and seawater, and does not pack under vibration or after wetting. It is particularly useful as an insulating covering for marine turbines and jet engines and in similar applications. The health hazards of asbestos fibers prompted a study of the world's asbestos industry by the Minerals Bureau of the South African Department of Mines early in 1977, and an international symposium on the subject, convened by the National Research Institute for Occupational Disease in Johannesburg, October 3-7, 1977, was attended by delegates from 11 countries including the United States. Officials of the domestic asbestos mining industry have cooperated with the Department of Mines in negotiations following the recommendations of the symposium. Dust control and sophisticated monitoring techniques were being incorporated in equipment for the Pomfret asbestos mine and newly designed mill in northern Cape Province. Installation of equipment for mechanical underground mining and construction of a mill to produce 70,000 tons of bagged asbestos fiber per year was started at Cape Asbestos S.A. (Pty.) Ltd.'s (CASA) Cape Blue mine and

Digitized by Google

mill at Pomfret, in northern Cape Province, 200 kilometers north of Kuruman. Cape Asbestos was registered in South Africa in 1893 after incorporation in London, to acquire properties of the Cape Mineral Syndicate which was developing asbestos deposits discovered 90 years earlier in the Orange River Valley. The Pomfret deposit was discovered in 1927 and mined from outcrop until 1937 when the first inclined shaft was sunk. The deposit has been the source of high-quality, long-spinning fiber exported worldwide. Cape Asbestos also operated the 90,000-ton-per-year amosite plant at Penga in the northeastern Transvaal.

Cement and Limestone.—Despite construction of infrastructure for the SASOL II project, construction generally declined throughout the country. The decline was reflected in diminished quarrying of limestone and shale (although burnt lime production increased) and in decreased production of cement.

Diamond.—Overall production of diamond (gem and industrial) increased 8.8% from 7.0 million carats in 1976 to 7.6 million carats in 1977. Sales of diamonds decreased 1.1% in quantity, but increased 19.8% in value from $247.4 million for 7.6 million carats in 1976 to $296.2 million for 7.5 million carats in 1977, reflecting world market price increases of 15% and 17% announced by De Beers' Central Selling Organization in March and December, respectively. Table 8 shows the marketed output of diamonds in carats and the U.S. dollar equivalents of the average prices per carat realized for diamonds from various sources in the Republic of South Africa. Virtually all production from the Transvaal Province was from the Premier mine near Pretoria, formerly 60% State-owned, but operated and 40% owned by Premier (Transvaal) Diamond Mining Co. (Pty.) Ltd. (PDMC), a wholly-owned subsidiary of De Beers. As of January 1, 1977, the parent company arranged to lease directly the 60% Government share and to pay $1.15 million to PDMC for its 40% share and to provide for additional capital for development to extract diamondiferous kimberlite from below the massive 100-meter sill of barren gabbroic rock cutting through the Premier pipe at a depth of nearly 500 meters. In return for committing capital to develop what amounts to a new, deep, diamond mine, De Beers was allowed a reduced lease-consideration rate from Government, a lower income tax rate, and an exemption from paying export duty on the portion of production destined for overseas sales. The price terms of the agreement were to be approved by the Minister of Mines early in 1978. Premier diamond production in 1977 included 333,000 carats from re-treating old dump material containing 0.1912-carat-per-ton, and 1,677,000 carats from underground ore and stockpiled ore containing 0.3145-carat-per-ton. Design work for mining below the gabbro sill was completed, and development work had provided access to the first reserve block selected for initial mining below the sill. This block was estimated to contain 14 million tons of kimberlite with an average diamond content of 0.72-carat-per-ton.

In the Cape Province, De Beers' largest producer was the Finch kimberlite pipe, west of Kimberly, which produced 2,426,000 carats from ore containing 0.6665-carat-per-ton. The Wesselton and Bultsfontein pipes produced 529,000 and 330,000 carats from ore containing 0.27- and 0.32-carat-per-ton, respectively, and the De Beers and Dutoitspan pipes produced 114,000 and 112,000 carats from ore containing about 0.16-carat-per-ton. De Beers also operated the Annex Kleinzee and Dreyers Pan mines in northwest Cape Province (Namaqualand) where ancient marine terrace gravels yielded 604,000 and 558,000 carats of alluvial diamonds from gravels containing averages of 0.23- and 0.39-carat-per-ton at an average size of 0.76- and 0.58-carat, respectively. The proportion of gem to industrial stones was much higher in alluvial deposits than in the kimberlite material.

In addition to De Beers output, The Nababeep Minerals Exploration Co. (Pty.) Ltd. produced some 200,000 carats of alluvial diamonds from its alluvial mine at Sendelings drift near the Orange River, northwest of O'okiep in northern Cape Province, and the State Alluvial Diggings also produced nearly 200,000 carats of alluvial stones from Nababeep's self-sustaining operation near Alexander Bay.

DeBeers' Koffiefontein mine, a kimberlite deposit 80 kilometers southeast of Kimberly, was responsible for virtually all of the diamond production from the Orange Free State Province. It accounted for nearly 410,000 carats of diamonds from 3.7 million tons of kimberlite containing an average of 0.11 carat per ton.

Table 8.—Republic of South Africa: Marketed diamond output, by province

Province	1976		1977	
	Output (carats)	Price per carat	Output (carats)	Price per carat
Mine diamond:				
Transvaal	2,083,709	$11.55	2,033,790	$12.90
Cape Province	3,642,727	22.95	3,627,912	25.22
Orange Free State	408,942	52.83	455,780	84.37
Total	6,135,378	21.07	6,117,482	25.53
Alluvial diamond:				
Transvaal	10,784	104.16	10,014	154.85
Cape Province	1,404,959	83.22	1,338,906	103.42
Orange Free State	61	207.38	34	434.29
Total	1,415,804	83.38	1,348,954	103.81
Grand total	7,551,182	32.75	7,466,436	34.50

Fluorspar.—The overall production of fluorspar increased 20.6% to a new high of 350,679 tons in 1977 compared with 290,718 tons in 1976. The greatest increase, 66%, was for ceramic grades, while output of metallurgical and acid grades increased by 24.8% and 11.3%, respectively. The value of local sales and exports increased 3.3% and 16.2%, respectively, in 1977, chiefly because of increased prices for metallurgical grades in both domestic and world markets. The country's proven fluorite ore reserves were recalculated as shown in table 9.

Table 9.—Republic of South Africa: Fluorite ore reserves

Location and type	Million tons	CaF_2 (percent)
Western Transvaal dolomitic ore	60	15-30
Bushveld granitic ore	40	25
Rust de Winter hematitic ore	18	+30
Total	118	XX

XX Not applicable.

Phosphate.—The Government-controlled Phosphate Development Corp. Ltd. (FOSKOR) continued as the major producer of phosphate rock from its open pit mine in the apatite-rich ring of the Palabora carbonatite structure in northeastern Transvaal. Overall phosphate ore production increased 24% to a new high of 14.6 million tons in 1977 over the 1976 record of 11.8 million tons. Domestic sales of crude ore decreased 43% in quantity and 24% in value. FOSKOR was responsible for nearly 90% of the 2.25 million tons of concentrate sold locally, of which more than 430,000 tons were sold to Federale Kunsmis Ltd. (FEDMIS) and Triomf Fertilizers (Pty.) Ltd. for the manufacture of phosphoric acid for export. Triomf operated its newly commissioned phosphoric acid plant at Richards Bay throughout 1977. The plant was designed to convert domestic and imported pyrite into 1.1 million tons of sulfuric acid per year. The acid will be used to treat 1.2 million tons of phosphate rock and produce 375,000 tons of 52% to 56% phosphoric acid annually. The phosphoric acid was pumped directly from the plant's storage tanks to the dockside for easy loading. No phosphate ore was exported, and concentrate export declined from 11,118 to 4,510 tons during the year. SAMANCOR reported sales of about 200,000 tons of concentrate from its Langebaan mine in Cape Province, and GFSA's Glendover Phosphate Ltd. of Thabazimbi in northwest Transvaal Province sold nearly 100,000 tons of selective mine-run and handcobbed ore during 1977.

About 40% of FOSKOR's mill feed consisted of phosphate-rich tailings pumped from the neighboring Palabora copper con-

Digitized by Google

centrator. Copper concentrates recovered from FOSKOR ores were smelted and refined in the Palabora facilities. FOSKOR's iron ore and zirconium byproducts continued to be marketed by a subsidiary company.

MINERAL FUELS

Coal.—Following the commissioning of the new Richards Bay coal-loading facility in April 1976 and the startup of new mines, overall coal production increased by 9 million tons and total exports by nearly 7 million tons to highs of 11.7% and 113%, respectively, greater than the 1976 records. The overall sales value (local sales plus exports) increased 46% from $595 million in 1976 to $869 million in 1977. Exports were expected to increase from 12.7 million tons recorded in 1977 to the 20-million-ton-per-year targeted capacity of Richards Bay by 1980-81. Domestic sales of anthracite declined by nearly 13% from 773,279 tons in 1976 to 673,583 tons in 1977, but the value increased from $12.8 million in 1976 to $13.2 million in 1977.

Coal imports were reduced to less than 300,000 tons, of which nearly 60,000 tons came from the United States and the remainder from undesignated, probably neighboring Southern African, sources. About 55% of the 73 million tons of domestically consumed coal was for the production of electricity, and 13% was used for the production of coke, chiefly for metallurgical industries, which also consumed part of the 11% used by "industries." The SASOL I oil-from-coal project accounted for 7% of the domestic consumption; household use, 4%; production of coal gas, 3%; and consumption at coal mines, use by other gas producers, and transport, 2% each; 1% was used in other mining operations. Details of production and sales of coal are shown in table 10.

Table 10.—Republic of South Africa: Coal production, local sales, and exports

	1976		1977

NA Not available.

Anglo American's Amcoal subsidiary reported that surface and underground work was on schedule at its Kleinkopje Colliery adjacent to its Landau No. 3 Colliery, near Witbank, Transvaal Province. Kleinkopje's opencast-underground operation was scheduled to achieve initial production of 2.7 million tons per year by 1979 at a capital cost of $125 million. Amcoal's new $127.7 million Kriel colliery reached its initial production level of 304,000 tons per month in August 1977, and its highly automated combined opencast-underground operation was expected to have a production rate of 6.5 million tons per year by mid-1979. The Republic's newest steam coal producer, the Ermelo Mines, jointly owned by General Mining and Finance Corp. Ltd., Union Corp., Ltd., British Petroleum, and Total Oil, expended nearly $75 million on its highly automated underground installation, which is scheduled to produce 3 million tons per year of steam coal for export by mid-1979. Initial production was reported during the third quarter of 1977. Construction and development of an open pit mine with a washing and sizing plant at the nearby Reitspriuit Colliery were also reportedly on schedule. An investment estimated at $115 million by Shell Coal of South Africa Ltd. and Transvaal Consolidated Land and Exploration Co. Ltd. (TCL) provided for initial production at 3 million tons per year in 1979 and 5 million tons per year at a later date under the management of Rand Mines Ltd. In April 1977, Duiker Exploration Ltd. of Lonrho South Africa Ltd. commenced expending $39 million for shaft sinking

Digitized by Google

at its recently acquired Tweefontein's Boschmansfontein property near Witbank. Three seams of coal were expected to yield 2 million tons of steam coal per year for domestic consumption by 1980.

SASOL continued operation of its Sigma Colliery and the adjacent SASOL I oil-from-coal plant in Orange Free State Province. Its subsidiary SASOL (Transvaal) Ltd. (SASOL II) completed development of its Bosjesspruit mine and much of its housing facilities at Secunda during the year. Most of the design engineering was completed, and major contracts and orders had been placed. Fluor Corp. of Los Angeles was the prime contractor for the chemical complex, and of the $2.9 billion (up from the previous $2.2 billion) estimated costs, $1.56 billion was scheduled to be spent in the Republic. Reportedly, 228 contracts worth $964 million had been placed with local firms.

An economically viable low-sulfur coal deposit of 300 million tons was reportedly proved by BP in the Middleburg area of the Transvaal. Government investigation of widespread deposits with recoverable coking-grade coal was continuing in the northern Transvaal, from near Ellisras in the west into the Kruger National Park towards the Mozambique border.

Petroleum.—Imports of crude petroleum for the domestic refineries decreased. On December 12, 1977, the Minister of Mines acknowledged a second strike of natural gas in a well drilled by the Sedco K offshore rig drilling for the Southern Oil Exploration Corp. (Pty.) Ltd. (SOEKOR). It was reported that the results were more encouraging than those encountered in the December 17, 1976 strike in the same general area, 61 kilometers south of the southern coast and about equidistant from Mossel Bay and Plattenburg Bay. High-pressure gas and condensate encountered at a depth of 2,987 meters (9,800 feet) was comparable to results of a 1969 strike made in the same area by Superior Oil Co., which subsequently relinquished its offshore lease.

The Mineral Industry of the Territory of South-West Africa

By Candice Stevens[1]

The mineral industry of the Territory of South-West Africa contributed approximately 46% to the 1977 gross domestic product (GDP) estimated at $1 billion.[2] Diamond ($220 million) and uranium ($175 million) were the major minerals in terms of value. Two firms, Consolidated Diamond Mines of South-West Africa (Pty.) Ltd. (CDM) and Rössing Uranium Ltd., accounted for 85% of the value of mineral output. The contribution of base metals fell to under 15% of mineral income in 1977 from 40% in 1976, owing to low metal prices. Tsumeb Corp. Ltd. and other base metal producers suffered losses during the year. Tsumeb kept two of its mines inactive in 1977, and Otjihase Mining Co. (Pty.) Ltd.'s copper mine was closed at yearend.

Construction ceased on the Ruacana Falls hydroelectric scheme owing to a dispute between Angolan and South African authorities. The project, involving the construction of a series of dams and hydroelectric plants along the Cunene River on the Angolan border, was financed largely by the Republic of South Africa. As originally conceived, the Ruacana Falls scheme would have supplied power to Windhoek, Swakopmund, Walvis Bay, and the Tsumeb operations. In 1977, the Republic of South Africa undertook to build a 120-megawatt powerline linking the Territory of South-West Africa with the Electricity Supply Commission of South Africa (ESCOM) grid.

PRODUCTION AND TRADE

The compilation of separate production and trade statistics for the Territory of South-West Africa was suspended by the South-West Africa Administration in 1965. Most of the statistical data on production of mineral commodities listed in table 1 were derived from the annual reports of the companies operating in the Territory. Trade statistics are incorporated with those of the Republic of South Africa, with which the Territory is a member in the South African Customs Union.

The country's primary mineral commodities in terms of revenue, diamond and uranium, showed substantial production increases in 1977. Copper production at the major mines of Tsumeb and Oamites Mining Co. (Pty.) Ltd. increased, but lead and zinc mine production evidenced a decline. Tin, tungsten, and vanadium production increased over 1976 levels.

The Territory's balance-of-trade surplus was estimated at $300 million in 1977. Steadily rising earnings from uranium and diamond were expected to keep the trade balance in surplus despite reduced revenue from base metal exports. Minerals accounted for approximately 60% of the total export value. Diamond was marketed by De Beers Consolidated Mines Ltd. The Republic of South Africa was the Territory's largest trading partner, taking about 50% of exports and supplying an estimated 80% of imports.

Table 1.—Territory of South-West Africa: Production of mineral commodities

(Metric tons unless otherwise specified)

Commodity[1]	1975	1976	1977[p]
METALS[2]			
Arsenic, white[3]	6,663	5,122	2,615
Cadmium:			
Mine output, metal content, recoverable	r118	118	88
Metal, refined	102	83	80
Copper:			
Mine output, metal content, recoverable[4]	39,034	36,000	36,234
Metal, blister	36,410	36,100	53,400
Lead:			
Mine output, metal content, recoverable	r53,100	46,400	41,200
Metal, refined	44,300	39,600	42,700
Silver:			
Mine output, metal content, recoverable[5] thousand troy ounces	1,823	r1,400	1,684
Smelter output, content of blister copper do	2,077	e1,250	1,200
Tin, mine output, metal content, recoverable	760	800	994
Tungsten, mine output, metal content, recoverable[e]	160	140	150
Uranium, U_3O_8 content	NA	700	2,760
Vanadium, mine output, metal content[e]	562	700	750
Zinc, mine output, metal content[6]	43,251	41,308	38,300
NONMETALS			
Diamond:[7]			
Gem[e] thousand carats	1,660	1,609	1,901
Industrial[e] do	88	85	100
Total do	1,748	1,694	2,001
Lithium minerals[8]	51,573	5,915	2,548
Pyrite concentrates, gross weight	9,643	9,200	9,000
Salt[e]	210,000	220,000	230,000
Sulfur, content of pyrite	4,455	4,000	4,000

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the commodities listed, the Territory of South-West Africa, prior to 1967, produced bismuth concentrate, cesium ore, columbite-tantalite concentrate, gold, manganese ore, molybdenum concentrate, graphite, kyanite, lime, mica, precious stones, sillimanite, and a variety of crude construction materials (clays, stone, and sand and gravel). No official statistics have been published since yearend 1966, and available information is inadequate to ascertain whether production has been continued or not, and if so, at what levels.

[2]Data are compiled from operating company reports as follows: Tsumeb Corp. Ltd. (arsenic, mine and refined cadmium, mine and blister copper, mine and refined lead, mine and smelter silver, mine zinc, and pyrite concentrate); South West Africa Co. Ltd. (SWACO) (mine lead, mine tin, mine tungsten, mine vanadium, and mine zinc); South African Iron and Steel Industrial Corp. Ltd. (ISCOR) for Imcor Zinc (Pty.) Ltd.'s Rosh Pinah mine (mine lead and mine zinc) and for ISCOR's own Uis mine (mine tin); General Mining and Finance Corp. Ltd. for Klein Aub Koper Maatskappy Ltd.'s mine near Rehoboth (mine copper and mine silver); and Falconbridge Nickel Mines Ltd. for Oamites Mining Co. (Pty.) Ltd.'s Oamites mine (mine copper). Data from Tsumeb and Falconbridge are for calendar years; data from other companies are for fiscal years ending June 30 of the year stated.

[3]White arsenic equivalent of all arsenic products reported as being produced.

[4]Figures comprise reported production of Tsumeb and Oamites plus estimates for Klein Aub and Johannesburg Consolidated Investment Co. Ltd.'s (JCI) Otjihase copper mine.

[5]Figures comprise reported production of Tsumeb plus estimates for Oamites and Klein Aub.

[6]Figures comprise reported production of ISCOR for Imcor's Rosh Pinah mine plus estimates for Tsumeb (based on ore milled) and SWACO.

[7]Totals are reported by De Beers Consolidated Mines Ltd. in company annual reports (for calendar years). Detail on gem and industrial diamond are estimates, assuming output to be 95% gem quality.

[8]Output has not been officially reported since 1966 but presumably has continued, since a number of countries record imports from "South Africa," which in total quantity considerably exceed the reported output of the Republic of South Africa and thus presumably include imports from the Territory of South-West Africa. Quantities given represent imports of the United States and the European Communities reported as originating in the Republic of South Africa, but a portion of the material may have been mined in Southern Rhodesia.

COMMODITY REVIEW

METALS

Tsumeb was the Territory's principal producer of nonferrous metals, including copper, lead, zinc, silver, cadmium, and arsenic. The value of its metal sales increased from $52 million in 1976 to $61 million in 1977. Newmont Mining Corp. (United States) was the manager and a principal shareholder (29.2%) of Tsumeb, whose other owners included AMAX, Inc. (29.2%), Selection Trust Ltd. (14.2%), O'okiep Copper Co. Ltd. (9.5%), Union Corp. Ltd. (9.4%), South West Africa Co. Ltd. (SWACO) (2.4%), and others (6.1%).

The company's largest mine, Tsumeb, milled 490,000 tons of ore containing 4.7% copper, 7.8% lead, and 2.0% zinc in 1977. The lower grade in 1977 was symptomatic of the gradual decrease in lead content as progressively deeper ore was mined. Reserves at Tsumeb, located 400 kilometers

Digitized by Google

north of Windhoek, were estimated at 4.9 million tons containing 4.4% copper, 7.1% lead, and 1.9% zinc.

Approximately 122,000 tons of ore containing 2.2% copper was milled at the Matchless mine, located 42 kilometers south of Windhoek. Reserves were estimated at 996,000 tons of ore containing 2.3% copper. Tsumeb halted development work at the Matchless mine during 1977 as part of an overall cost-reduction program.

The Kombat and Asis Ost mines, located near the Tsumeb mine, were inactive in 1977. Development work continued at the Asis West mine, where reserves were estimated at 1.5 million tons grading 7.8% copper and 4.3% lead. Production at Asis West, under the joint ownership of Tsumeb (85%) and SWACO (15%), was scheduled to begin in 1979.

Tsumeb produced 22,827 tons of copper and 34,446 tons of lead in 1977. A total of 1,141 tons of zinc metal contained in concentrates was exported from Walvis Bay for overseas smelting and refining. Tsumeb also produced 2,615 tons of arsenic trioxide material, 88 tons of cadmium, and 1.4 million troy ounces of silver.

Copper.—The Territory's second largest producer of copper was Oamites, a joint venture of Falconbridge Nickel Mines Ltd. of Canada (74.9%) and International Development Corp. (IDC) of the Republic of South Africa (25.1%). The Oamites mine, located 55 kilometers south of Windhoek, milled 620,000 tons of ore in 1977 compared with 600,000 tons in 1976. Recoverable copper output increased from 6,400 tons in 1976 to 6,900 tons in 1977. The production increase was owing to the 3% rise in ore milled and the improvement in grade from 1.14% in 1976 to 1.2% in 1977. Despite the rise in output, Oamites suffered losses of approximately $450,000 for the year owing to low metal prices. Reserves at yearend were estimated at 3.5 million tons containing 1.19% copper and 0.50 troy ounce of silver per ton.

Production at the mine owned by Klein Aub Koper Maatskappy Ltd., a subsidiary of General Mining and Finance Corp. Ltd. (Republic of South Africa), was approximately 3,500 tons of recoverable copper. The latest estimate of ore reserves was 8 million tons of copper-silver ore with an average content of 2.5% copper; the mine was reported to remain economic owing to the silver content of the ore.

The Otjihase copper mine, which came onstream in October 1975, was placed on a care-and-maintenance basis on December 22, 1977. The mine suffered losses of approximately $11.5 million in 1977 owing to low metal prices and technical difficulties that prevented Otjihase from reaching full capacity. In 1977, approximately 811,000 tons of ore was milled and 13,580 tons of 22% copper concentrates was produced. In addition, pyrite concentrates were sold to Rössing on a contractual basis. The Otjihase mine, located 27 kilometers northeast of Windhoek, was owned by Johannesburg Consolidated Investment Co. Ltd. (JCI) and Minerts Development (Pty.) Ltd. JCI reduced its shareholding from 52.5% to 49% during the year.

Lead, Zinc, Vanadium.—The major producer of zinc and a secondary producer of lead was the Rosh Pinah mine, operated by Imcor Zinc (Pty.) Ltd., a subsidiary of South African Iron and Steel Industrial Corp. Ltd. (ISCOR). In 1977, its production of both zinc and lead increased substantially. Zinc concentrate production increased from 25,000 tons (with a zinc content of 50.6%) in 1976 to 40,300 tons (with a zinc content of 48.4%) in 1977. Lead concentrate production increased from 7,000 tons in 1976 to 11,900 tons (with a lead content of 45%) in 1977. Mining at Rosh Pinah, located in the Namib Desert about 27 kilometers north of the Orange River, was by open pit methods. In 1977, the zinc output was shipped through Lüderitz Bay to Zinc Corp. of South Africa Ltd.'s (ZINCOR) electrolytic refinery in the Republic of South Africa. Lead concentrate was marketed in the Territory.

The Territory's other producer of lead and zinc and the only producer of vanadium was the Berg Aukas mine, operated by SWACO. At yearend 1976, SWACO was acquired by Kiln Products Ltd., partially owned by Gold Fields of South Africa Ltd. Milling capacity at Berg Aukas was 125,000 tons per year of ore, leading to an average production of 40,000 tons of lead, zinc, and vanadium concentrates. Owing to low metal prices, SWACO was considering placing the underground operations at Berg Aukas on a care-and-maintenance basis in 1978.

Silver.—Domestic production of silver, a byproduct of copper and lead mining, increased to approximately 1.7 million troy ounces in 1977. The largest silver producer was Tsumeb, which recovered 1,404,000 troy ounces in company-produced concentrates (compared with 1,128,000 troy ounces in 1976). The balance of silver production was

Digitized by Google

from the Oamites and Klein Aub copper mines. Virtually all silver produced in the Territory was processed by Tsumeb, which then exported it for toll refining elsewhere.

Tin and Tungsten.—The Territory produced 994 tons of tin metal and 150 tons of tungsten metal in 1977. The major tin producer was the Uis tin mine, operated by Industrial Minerals Mining Corp. (Pty.) Ltd., a wholly owned subsidiary of ISCOR. Its production again decreased, from 1,262 tons of tin concentrate (with a tin metal content of 63.4%) in 1976 to 1,247 tons (with a tin metal content of 63.7%) in 1977. Output from the Uis mine, located northeast of Swakopmund near Brandberg, was shipped to ISCOR's smelter at the Vanderbijlpark steelworks in the Republic of South Africa.

The Brandberg West tin-tungsten mine increased its output to about 200 tons of tin and 142 tons of tungsten. Reserves at the mine, operated by SWACO, were estimated at 6.6 million tons grading 0.2% combined tin and tungsten.

Tungsten was the main product at the Krantzberg mine, owned by Nord Resources Corp. (40%) and Ebco Mining Co. (60%), both of the United States. Nord Resources served as operator and marketed all output of Nordex Joint Venture Ltd. Although Krantzberg's production capacity was rated at 7,500 tons per year of concentrates, the plant was reported as operating at much less than capacity. Mill modifications and repairs were in progress at the mine, situated northwest of Windhoek near Omaruru.

Uranium.—Production at the large uranium mine operated by Rössing was 2,760 tons of U_3O_8 in 1977. The mine was originally scheduled to reach full capacity of 5,000 tons of U_3O_8 per year in 1977 but will not achieve this goal until 1979. Since starting up in 1976, Rössing has encountered both labor problems and technical difficulties in the treatment plant. In addition, unsuitable ground conditions and variations in ore grades have lowered output. Plant modification at a cost of $40 million was to rectify problems at the processing plant and allow the plant to reach its rated milling capacity of 40,000 tons per day of ore and also increase recovery to 85%.

The large, low-grade (0.04%) uranium ore body, situated 70 kilometers northeast of Swakopmund, has been under development since 1966. Reserves were estimated at 150,000 tons of U_3O_8. Scheduled to become one of the largest uranium mines in the world when full production is reached, the Rössing mine's initial cost was estimated at $210 million. Open pit mining was to be supplemented by an underground mine to be commissioned after plant changes were effected.

The largest shareholder in the Rössing venture was Rio Tinto-Zinc Corp. Ltd. of the United Kingdom (42.5%). Also holding interest in the mine were IDC, General Mining, and Total Compagnie Minière et Nucleaire (France). Production is to be marketed in Western Europe and Japan. The British Atomic Energy Commission contracted to receive 7,500 tons of U_3O_8 over a period of 5 to 6 years.

Several other companies were active in uranium prospecting in the areas north and east of Swakopmund. General Mining was finalizing details on the exploitation of the Langer Heinrich uranium deposit, located near Tinkas. Testing conducted in a pilot plant during the year indicated no major treatment problems. Gold Fields was assessing reserves at a large deposit at Trekkopje, adjacent to the Rössing property. Anglo-American Corp. of South Africa Ltd., JCI, and Falconbridge were also exploring for uranium in the Territory.

NONMETALS

Cement.—Feasibility studies were in progress in 1977 regarding the construction of a cement plant at Karibib northwest of Windhoek. An initial investment of $23 million was to be made by South-West Africa Portland Cement Co. Ltd., owned by Pretoria Portland Cement Co. Ltd. and Anglo-Alpha Cement Co., both of the Republic of South Africa. Based on local limestone and gypsum deposits, the plant would begin production in 1981.

Diamond.—The value of the diamond production of CDM, a wholly owned subsidiary of De Beers, represented 22% of De Beers' earnings in 1977. The tonnage treated at Oranjemund increased from 12.9 million tons in 1976 to 14.9 million tons in 1977, and the grade increased from 0.1315 carat to 0.1343 carat per ton. Final diamond recovery increased from 1.69 million carats in 1976 to 2 million carats in 1977, of which approximately 95% was gem stones. However, the average stone size decreased from 0.95 carat to 0.72 carat.

The production increase in 1977 was mainly owing to the commissioning of the No. 3 conglomerate plant, which reached full capacity of 360,000 tons per month in

Digitized by Google

July, and completion of modifications to the other three plants, which were operating at rated capacity at yearend.

CDM, which has surface-mined marine terraces in the Territory since 1920, officially moved its headquarters from Kimberley, Republic of South Africa, to Windhoek in 1977. The company pledged to devote a proportion of its profits to new projects in the Territory and appropriated $28 million for the purpose of diversifying outside the diamond area. CDM also initiated a comprehensive program of job evaluation at the mines and began construction on a technical institute in Ovamboland.

In January 1978, CDM was to undertake a survey of 100,000 square kilometers in four areas — east of Windhoek, north of Lüderitz, south of Keetmanshoop, and north of Tsumeb — to supplement its previous reconnaissance prospecting. Sampling was also to continue at Arrisdrif, on the northern bank of the Orange River. In 1977, technical problems of sampling marine gravel deposits in deeper water were overcome, and prospecting at sea was to be extended.

Lithium.—In 1977, approximately 2,500 tons of lithium minerals was produced. South-West Africa Lithium Mines (Pty.) Ltd., owned by Klöckner & Co. K.G. (Federal Republic of Germany), began mining lithium in the Karibib area before World War I. At the Rubicon mine, lepidolite, petalite, beryl, and amblygonite were produced by open pit methods. At the Helicon mine, petalite was produced partly by open cast methods and partly by underground operations. Reserves were estimated at 1 million tons of lepidolite ore averaging 2% Li_2O, in addition to further tonnage of high-grade ore. The flotation plant had a capacity of 10,000 tons per year of lepidolite concentrates. Production was exported to Japan and Western Europe.

Stone.—*Marble.*—The Geological Survey, in conjunction with the National Building Research Institute of South Africa, was conducting studies on the suitability of marble reserves for dimension stone quarrying. The most significant occurrences of commercial stone were in the mountains to the northwest and southwest of Karibib, which contained white, colored, and variegated marble deposits of good quality. Deposits at Karibib and east of Swakopmund were being worked on a limited scale for the manufacture of furniture and ornamental items.

MINERAL FUELS

Petroleum.—There was no exploration activity reported in the Territory in 1977. Southern Oil Exploration Corp. (Pty.) Ltd. (SOEKOR), the South African organization entrusted with coordinating oil exploration in both the Republic and the Territory, planned to drill offshore in deep water block 13 in 1978. Holders of petroleum rights included Canada Southern Petroleum Ltd. and Etosha Petroleum Co. Pty. Ltd. All areas not assigned were held by the State company, Southern Oil Exploration Corp. (South-West Africa) (Pty.) Ltd. (SWAKOR), a subsidiary of SOEKOR.

The Mineral Industry of Spain

By Roman V. Sondermayer[1]

Spain produced a variety of minerals during 1977, among which mercury, pyrite, fluorspar, strontium, gypsum, lead, potash, zinc, and petroleum refinery products were important to the world economy.

Spain's foreign trade balance in minerals was negative, and the country remained dependent on imports of coal, natural gas, crude oil, nonferrous metals, and iron ores to meet its demand.

The mineral industry of Spain, including processing, accounted for 11% of the gross national product (GNP) during 1977; about 1% of the GNP was contributed by the extractive industries alone. Approximately 200,000 persons were employed in the mineral industry of the country. Following the end of the Franco dictatorship, labor unions were in the process of organizing the work force along nontotalitarian lines.

The Government continued to regulate activities of the mineral industry. The Ministry of Industry and Energy's proposed Royal Decree 1102 of 1977, which expanded upon provisions of the Mining Development Law approved in 1976, listed raw minerals by priority status under the National Supply Plan. Phosphate, coal, uranium, copper, tin, iron, lead, nickel, aluminum, asbestos, chromium, manganese, titanium, tungsten, zinc, potash, fluorite, ornamental stone, kaolin, marble, granite, and magnesite were to receive priority for a 2-year period for credits and other measures taken by the Government to stimulate the mineral industry. Furthermore, the Bureau of Energy and Mineral Resources was created within the Ministry of Industry and Energy. The responsibilities of the new Bureau included drafting proposals for the national energy, fuels, and mineral supply plans; determining rates and prices for energy services and products; controlling consumption of raw minerals, including fuels; establishing policies, in cooperation with other Government agencies, on imports of minerals; and taking action to develop mining and energy technology. In addition, the Inter-Ministerial Committee was examining a draft of the Second National Energy Plan for submission to the Parliament. The major purpose of the plan was to lower energy consumption, reduce dependence on imports, diversify energy sources, and foster energy technology.

During 1977, as in the past, the Ministry of Industry and Energy implemented the mineral laws, regulated the private sector, and managed most of the mineral industry through the Instituto Nacional de Industria (INI). In an effort to alleviate economic difficulties resulting from the high cost of imported fuels, INI planned a 26% increase in investments in petroleum sector ventures.

During 1977, the principal events in the mineral industry included construction of an aluminum plant at San Ciprián, development of the Aznacollar copper-mining complex near Sevilla, beginning of production at the Rubiales lead and zinc mine, completion of expansion of the zinc smelter at San Juan de Nieva, and authorization to expand the capacities of several petroleum refineries.

PRODUCTION

Production of mineral commodities for 1975-77 is detailed in table 1.

Total do	316,924	376,137	354,833

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]Includes recorded production of salable acid-grade fluorspar from both fluorspar mines and lead-zinc mines, and some salable acid-grade fluorspar obtained by beneficiating a portion of total reported salable metallurgical-grade fluorspar.

[2]Includes sand obtained from kaolin.

[3]Less than 1/2 unit.

[4]Revised to none.

TRADE

Spain's mineral commodity trade for 1975 and 1976 is shown in tables 2 and 3. United States-Spanish trade for 1976 is shown in table 4.

Table 2.—Spain: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Oxide and hydroxide	59	53	Portugal 26; United Kingdom 20.
Metal including alloys:			
Scrap	273	215	West Germany 99; France 95; Italy 20.
Unwrought	2,389	10,805	United States 4,408; United Kingdom 3,041.
Semimanufactures	6,547	13,240	United States 3,715; France 1,565.
Antimony metal including alloys, all forms	139	323	France 128; Netherlands 106; United Kingdom 37.
Arsenic trioxide, pentoxide, acids	2	2	All to Libya.
Cadmium metal including alloys, all forms	176	172	Belgium-Luxembourg 79; France 74.
Chromium oxide and hydroxide	18	30	Greece 9; Switzerland 9; Colombia 6.
Copper:			
Ore and concentrate	3	1,141	All to Bulgaria.
Matte	NA	626	All to Belgum-Luxembourg.
Copper sulfate	2	(1)	Mainly to Argentina and Venezuela.
Metal including alloys:			
Scrap	141	102	West Germany 45; United Kingdom 40; France 12.
Unwrought	17,230	34,433	France 19,402; United Kingdom 5,875.
Semimanufactures	8,207	6,095	France 2,280; Iran 730.
Iron and steel:			
Ore and concentrate, except roasted pyrites thousand tons	1,960	2,188	West Germany 825; Romania 438; France 347.

See footnotes at end of table.

Table 2.—Spain: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Iron and steel —Continued			
Roasted pyrite thousand tons	531	628	West Germany 474; Spain 125.
Metal:			
Scrap	1,529	466	France 267; West Germany 62; Switzerland 54.
Sponge iron, powder, shot	6,162	6,498	France 2,117; West Germany 1,256; Italy 1,216.
Ferroalloys:			
Ferromanganese	17,215	39,533	United States 10,375; West Germany 6,254; Sweden 4,046.
Other	25,432	39,793	West Germany 13,404; United Kingdom 6,885; Romania 5,185.
Steel, primary forms	15,603	80,121	United States 30,047; Brazil 25,355; Yugoslavia 7,788.
Semimanufactures:			
Bars, rods, angles, shapes, sections	1,109,000	1,499,000	Iran 237,537; Poland 209,949; West Germany 197,925.
Universals, plates, sheets	279,237	651,976	West Germany 150,620; United States 143,564; Brazil 89,468.
Hoop and strip	6,803	16,362	France 13,487; Portugal 1,062.
Rails and accessories	14,624	15,192	Egypt 14,451.
Wire	7,642	13,439	Algeria 4,645; France 3,939; Italy 922.
Tubes, pipes, fittings	128,381	167,378	France 57,480; West Germany 25,880; People's Republic of China 21,027.
Castings and forgings, rough	14,624	10,806	West Germany 1,823; France 1,712; Belgium-Luxembourg 998.
Lead:			
Oxide	1	5	West Germany 4; Andorra 1.
Metal including alloys:			
Scrap	NA	10	All to United Kingdom.
Unwrought	1,564	1,444	Netherlands 1,232.
Semimanufactures	74	98	Algeria 44; Andorra 20; Morocco 14.
Manganese:			
Ore and concentrate	24	125	West Germany 53; Portugal 45; Morocco 22.
Oxide	1,769	1,722	Mainly to France.
Metal	20	--	
Mercury 76-pound flasks	18,826	23,265	United States 4,554; Romania 4,032; India 3,191.
Molybdenum metal including alloys, all forms	3	1	All to Mauritania.
Nickel metal including alloys:			
Scrap	462	652	West Germany 344; France 196; Belgium-Luxembourg 88.
Unwrought	14	44	Netherlands 40.
Semimanufactures	42	33	West Germany 31.
Platinum-group metals and silver:			
Waste and sweepings kilograms	NA	38	All to France.
Metals including alloys:			
Platinum-group troy ounces	3,569	385,808	All to Switzerland.
Silver thousand troy ounces	1,029	225	Denmark 193.
Selenium, elemental kilograms	300	800	Portugal 700.
Tin:			
Ore and concentrate	NA	10	All to West Germany.
Metal including alloys:			
Scrap	33	124	All to United Kingdom.
Unwrought	1,573	2,489	Netherlands 1,829.
Semimanufactures	10	2	Portugal 1.
Titanium oxide	4,784	7,061	West Germany 1,970; France 1,911; United Kingdom 803.
Tungsten:			
Ore and concentrate	573	467	West Germany 220; United Kingdom 122; Netherlands 52.
Metal including alloys, all forms	23	14	West Germany 7; Switzerland 5.
Zinc:			
Ore and concentrate	7,379	6,545	West Germany 5,235; Canada 720.
Oxide	333	776	Belgium-Luxembourg 385; West Germany 201; France 80.
Metal including alloys:			
Blue powder	881	465	United States 401.
Unwrought and semimanufactures	30,757	34,789	United States 25,069.
Other:			
Ores and concentrates of molybdenum, tantalum, titanium, vanadium, zirconium	184	20	Netherlands 14; United States 5.
Ash and residue containing nonferrous metals	17,069	23,247	East Germany 12,459; Norway 4,400; Republic of South Africa 2,785.
Oxides, hydroxides, peroxides of metals	398	9,225	Algeria 3,804; Kuwait 2,500; Saudi Arabia 2,024.

Table 2.—Spain: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Other —Continued			
Metals including alloys, all forms:			
Alkali, alkaline earth, rare-earth metals	(1)	(1)	NA.
Pyrophoric alloys	(1)	(1)	NA.
Base metals including alloys, all forms, n.e.s	337	511	Netherlands 193; France 134; Belgium-Luxembourg 84.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	784	317	West Germany 119; France 79; Syria 32.
Dust and powder of precious and semiprecious stones, except diamond value, thousands	$408	--	
Grinding and polishing wheels and stones	1,824	2,068	West Germany 898; Cuba 145.
Asbestos	162	5	Andorra 4; Mexico 1.
Barite and witherite	50,675	52,801	West Germany 46,111.
Boron materials, oxide and acid	252	16	West Germany 10; Egypt 6.
Cement thousand tons	3,682	4,889	Algeria 981; Morocco 681; Ivory Coast 377.
Chalk	3,745	5,376	Portugal 2,823; Libya 2,400.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	24,200	25,560	Portugal 10,453; Netherlands 2,425; France 2,253.
Kaolin (china clay)	47,698	59,237	Italy 21,076; West Germany 16,491; France 8,883.
Other	10,556	10,419	Andorra 3,757; Portugal 1,649; Italy 1,057.
Products:			
Refractory (including nonclay brick)	13,439	12,333	Cuba 4,216; Egypt 1,802; Morocco 1,450.
Nonrefractory	269,436	273,105	France 56,687; West Germany 40,274; Libya 22,479.
Diamond, industrial, including powder value, thousands	$620	$9,597	Belgium-Luxembourg $5,483; Mexico $3,098.
Diatomite and other infusorial earth	1,239	2,919	Netherlands 1,324; Belgium-Luxembourg 435; France 415.
Feldspar, leucite, nepheline, nepheline syenite	1,406	2,747	France 2,274.
Fertilizer materials:			
Crude and manufactured:			
Nitrogenous	14,121	190,029	Belgium-Luxembourg 90,371; West Germany 34,844; United States 20,035.
Phosphatic	NA	100	All to Portugal.
Potassic	127,982	408,630	United Kingdom 67,439; Norway 59,575; Portugal 47,165.

Cobalt oxide and hydroxide	109	218	United States 75; Belgium-Luxembourg 55; Canada 48; France 23.
Copper:			
Ore and concentrate	142,827	174,126	Australia 92,276; Chile 21,294; Cyprus 19,571.
Matte	27,439	25	All from France.
Copper sulfate	2,365	1,604	France 701; U.S.S.R. 400; Belgium-Luxembourg 352.
Metal including alloys:			
Scrap	16,149	8,740	France 3,420; United States 2,755; Canada 901.
Unwrought	54,931	44,794	Chile 22,209; Belgium-Luxembourg 14,602.
Semimanufactures	13,240	18,243	Italy 2,444; United Kingdom 2,395; Chile 2,375.
Gold:			
Waste and sweepings kilograms	68	7	All from West Germany.
Metal, unworked or partly worked thousand troy ounces	1,157	1,543	United Kingdom 868; Switzerland 482.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	6,135	6,149	Brazil 2,296; Venezuela 868; Liberia 772.
Roasted pyrite	70,762	7	All from Italy.
Metal:			
Scrap thousand tons	2,198	2,657	United States 1,768; United Kingdom 212.
Pig iron, including cast iron do	35	54	Brazil 12; United Kingdom 10.
Sponge iron, powder, shot do	7	9	Sweden 5; France 3.
Ferroalloys do	21	26	Sweden 3; France 2; West Germany 2.
Steel, primary forms do	1,202	2,146	Japan 1,351; Australia 387; Romania 123.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	219	165	Japan 47; United Kingdom 28; West Germany 22.
Universals, plates, sheets do	317	251	West Germany 66; France 61; Netherlands 31.
Hoop and strip do	41	54	France 30; West Germany 10; Belgium-Luxembourg 4.
Rails and accessories do	4	2	United Kingdom 1.
Wire do	13	13	Belgium-Luxembourg 4; West Germany 3; France 2.
Tubes, pipes, fittings do	89	99	France 46; West Germany 20; Italy 10.
Castings and forgings, rough do	2	1	Mainly from Switzerland and France.
Lead:			
Ore and concentrate	26,028	17,887	Denmark 5,251; Morocco 5,240; Poland 2,958.
Oxide	243	251	Bulgaria 200; Mexico 49.
Metal including alloys:			
Scrap	454	2,494	France 818; United States 502; Canada 401.
Unwrought	6,848	8,995	United Kingdom 4,040; France 1,602; Canada 1,200.
Semimanufactures	179	214	Morocco 147; West Germany 34.
Magnesium metal including alloys, all forms	1,137	706	United States 314; Norway 138; France 101.

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Manganese:			
Ore and concentrate	437,379	410,151	Ghana 109,453; Gabon 82,686; Republic of South Africa 69,982.
Oxide	1,417	842	United States 611; Belgium-Luxembourg 147.
Metal	487	649	Republic of South Africa 358; Japan 231.
Mercury 76-pound flasks	11	29	All from France.
Molybdenum metal including alloys, all forms	22	27	United States 7; Austria 6; West Germany 4.
Nickel:			
Ore and concentrate	NA	64	NA.
Matte, speiss, similar materials	212	234	Finland 96; Norway 66; Canada 47.
Metal including alloys:			
Scrap	114	--	
Unwrought	4,785	7,724	Canada 2,891; Cuba 2,373; United Kingdom 1,094.
Semimanufactures	3,061	1,901	France 762; West Germany 537.
Platinum-group metals and silver:			
Ores and concentrates	6,668	3,040	Australia 2,606.
Waste and sweepings	499	353	United States 237; France 102.
Metals including alloys:			
Platinum-group troy ounces	r257,206	160,754	Brazil 96,452; France 32,151.
Silver thousand troy ounces	4,662	4,887	West Germany 1,157; Belgium-Luxembourg 1,124; France 789.
Rare-earth metals:			
Oxides	112	204	France 172; United Kingdom 28.
Metals including alloys	7	20	West Germany 9; Brazil 4; France 3.
Selenium, elemental	16	35	Japan 12; West Germany 6; United States 6; Norway 4.
Silicon, elemental	9	3	Belgium-Luxembourg 2; West Germany 1.
Tellurium, elemental	2	2	West Germany 1; U.S.S.R. 1.
Tin:			
Ore and concentrate	7,467	7,486	Belgium-Luxembourg 4,800; Indonesia 1,008; Malaysia 857.
Oxide	75	148	United Kingdom 95; West Germany 45.
Metal including alloys	93	104	United Kingdom 51; Malaysia 15.
Titanium:			
Ore and concentrate	54,851	101,302	Norway 65,005; Australia 23,708; Malaysia 857.
Oxide	1,547	2,216	West Germany 769; France 533; United Kingdom 420.
Tungsten:			
Ore and concentrate	27	--	
Metal including alloys, all forms	8	11	Austria 2; France 1; Ireland 1.
Uranium and thorium:			
Oxide	1	1	NA.
Metals including alloys, all forms kilograms	493	586	All from United States.
Vanadium:			
Pentoxide	15	36	United States 34.
Metal including alloys, all forms	2	1	All from United States.
Zinc:			
Ore and concentrate	137,901	117,814	Peru 63,211; Denmark 24,140; Sweden 10,183.
Oxide and peroxide	346	354	West Germany 286; Italy 44.
Metal including alloys, all forms	117	284	United Kingdom 204.
Zirconium metal including alloys, all forms	5	2	France 1; United States 1.
Other:			
Ores and concentrates Of molybdenum, tantalum, titanium, vanadium, zirconium	15,917	13,433	Australia 12,233.
Ash and residue containing nonferrous metals	20,415	28,568	Belgium-Luxembourg 10,309; United States 6,529; Canada 2,548.
Oxides, hydroxides, peroxides of metals	1,744	2,283	West Germany 888; France 529; United Kingdom 236.
Metals including alloys, all forms:			
Alkali and alkaline earth	148	210	West Germany 192.
Pyrophoric alloys	8	891	Mainly from France.
Base metals including alloys, all forms, n.e.s	1,133	1,462	United States 266; Belgium-Luxembourg 152.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	1,448	751	France 320; United States 221; Italy 150.
Dust and powder of precious and semiprecious stones, except diamond value, thousands	$37	$1	Mainly from Netherlands and United Kingdom.
Grinding and polishing wheels and stones	1,480	1,235	United Kingdom 272; France 239; Italy 231.

COMMODITY REVIEW

METALS

Aluminum.—Construction proceeded on the alumina-aluminum complex at San Ciprián (Lugo Province) owned by Aluminio Español S.A. When it goes into operation in 1978 or 1979, annual production should reach 800,000 tons of alumina and 175,000 tons of aluminum. The plants were built so that annual capacity could be doubled for alumina and increased to 270,000 tons for aluminum. Empresa Nacional de Aluminio S.A. (ENDASA), a Government corporation, controlled by INI, owned 55% of Aluminio Español S.A.

During 1977, four primary aluminum smelters were in operation. ENDASA was the major producer of aluminum in the country and operated Spain's largest smelter, a 110,000-ton-per-year plant near Àviles. Spain, with its modest production of bauxite, remained largely dependent on imports to meet the demand of domestic smelters.

Copper.—The major activities of Spain's copper industry were at the Aznacollar mining complex near Sevilla, operated by Andaluza de Piritas S.A. (APIRSA). Preparation of the mine for production continued during 1977. Planned annual production targets for the opencast mine were set at 2 million tons of complex sulfide ores, mostly pyrites, and 1.5 million tons of copper pyroclasts. The overburden-to-ore ratio is expected to be 3.2:1. A new pilot plant went onstream during the year, and a flotation plant was planned near the mine which was expected to annually yield about 51,000 tons of copper concentrates, 42,000 tons of lead concentrates, and 98,000 tons of zinc concentrates. Proven reserves of the deposit amounted to 78.5 million tons. Approximately 44.5 million tons of this was complex sulfide ore with 0.58% copper, 1.78% lead, 3.33% zinc, and 57 grams silver per ton; the remainder was cupriferous pyrite ore with about 0.58% copper, 0.40% lead, and 10 grams silver per ton. The completion date for all segments of the complex was set back to 1980 or later because of metallurgical problems.

Iron Ore.—Exploration of the iron ore deposit found during 1975 in the Marquesado zone of Granada Province (in southern Spain near the Alquife mines continued during 1977. Reports indicated reserves of about 30 million tons of high-grade ore. An annual production of 1 million tons is planned for the new mine. Expansion of capacities was underway at the following mines: Andaluza de Minas (Granada Province), Mineral del Andevalo (Huelva and Badajoz Provinces), Agraminas (near Bilbao, Vizcaya Province), and Sierra Minera (Teruel and Guadalajara Provinces). By 1982, when all these projects are completed, Spain will have an additional iron ore capacity of about 32 million tons of ore per year. Most of Spain's current iron ore production comes from León, Teruel, Vizcaya, and Guadalajara Provinces.

Iron and Steel.—During 1977, Empresa Nacional Siderúrgica S.A. (ENSIDESA) remained the principal steel producer in the country. ENSIDESA, with plants located at Àviles, La Felguera, Gijón-Moreda, and Gijón-Verina, accounted for approximately 44% of the country's pig iron production and about 45% of the steel output.

There were no installations for direct reduction of iron ore in operation during 1977. However, two plants were planned. One installation, with two modules using natural gas as reductant, will be located in northern Spain near the port of Bilbao. The other facility, with one module using manufactured gas as reductant, will be located in the Bay of Algeciras in southern Spain. Both projects are planned to start operation at the end of 1980, with an aggregate capacity of 1.5 million to 1.7 million tons per year.

Lead and Zinc.—The beginning of production at the new 900,000-ton-per-year lead and zinc ore mine at Rubiales (Lugo Province, in northwestern Spain) was the major event in the lead and zinc sector. The exploration and development program at Rubiales was started in 1965 by Explaración Minera Internacional España S.A. (Exmines), a consortium made up of Cominco Europe N.V. 47.48%, Holdings Nominees Pty. Ltd. 21.59%, Asturiana de Zinc S.A. 20.00%, Banco Urquijo S.A. 5.04%, Union Corp. S.A. (Luxembourg) 4.40%, Negocios y Fiducias 0.31%, and Gunnex Ltd. 0.18%; the remaining 1% is held by private owners. Cominco Europe, a wholly owned subsidiary of Cominco Ltd. of Vancouver, British Columbia, Canada, provided technical services during development of the Rubiales mine. After about 13 years of work, an underground mine and a mill with a selective

Digitized by Google

flotation plant were brought onstream during 1977. The mine is rated at 124,000 tons of zinc concentrates and 17,000 tons of lead concentrates per year.

A description of the Rubiales mine was published during the year.[2] Rubiales ores, primarily lead and zinc sulfides with very little iron, occur in the silicified limestone in the drag-folded eastern flank of an anticline that plunges about 15°. Ore is generally 10 to 25 meters thick in the upper ore blocks and is up to 30 meters thick in the lower levels. Proven reserves were reported at 12 million tons with an average content of 8.1% zinc and 1.5% lead.

The main shaft at Rubiales is equipped with a four-rope, friction-type main hoist with a 1,600 horsepower, tower-mounted drum measuring 4.19 meters in diameter. Capacity is 14 tons through a maximum hoisting distance of 1,000 meters. Maximum speed is 10 meters per second, and the skip is in part counterbalanced with a 7-ton-capacity cage.

Estimates made by planners at Rubiales show that about 80% of the mine output can be extracted from open stopes. Stopes average 30 meters in width and are 70 meters high, alternating along the strike with 30-meter pillars. Stopes will be backfilled with tailings and sand, and later the pillars will be recovered. Atlas-Copco in-the-hole drills are used for drilling 6 1/2-inch holes that are blasted into slots, and ore is moved by load-haul-dump machines to passes leading to haulage levels. A Clayton locomotive, pulling a 13-car string of 10-ton, Granby-type cars, moves ore along a 1-kilometer-long haulage level.

In general, the roof is secured with resin-anchored roof bolts, and grouted anchor cables secure the back. Two 250,000-cubic-foot-per-minute exhaust fans blow air out of the mine through a 4.5-meter-diameter ventilation shaft which connects the main haulage level (597 level) with the surface. Downcast air enters the mine through the production shaft and the ramp.

The crystalline structure of the mineralization does not require fine grinding. However, the silica in the ore floats in the coarser grinds and is reground to be depressed in finer sizes.

Rubiales ore beneficiation starts with primary crushing underground which is completed in the surface plant. Sala rod and ball mills reduce the ore to 65% minus 200 mesh, and the pulp reaches the flotation circuits with 40% solids. The flotation section has 200-cubic-foot Denver cells in the roughing circuit, 100-cubic-foot cells in the zinc-cleaning circuit, and 50-cubic-foot cells in the lead-cleaning and recleaning circuits. Controls include high-level alarms on bins, a weightometer on feed to the rod mill (connected to a variable-speed feeder as a control on feed rate), and automation of makeup water feed to give constant density in the mill discharge. There are automatic samplers on plant feed, final lead concentrate, final zinc concentrate, and final tailings. Liquid-solid separation facilities and a zinc concentrate dryer are part of Rubiales' beneficiation installations. Mill water is close-circuited with no overflow from tailings. A concrete-faced rockfill dam is used to impound tailings and store process water. The Rubiales plant draws 12 to 18 liters per second of makeup water from a spring. Concentrate is loaded in 25-ton containers and trucked to the railroad point at Villafranca del Bierzo.

Expansion of the zinc smelter at San Juan de Nieva, owned by Soc. Minera y Metalúrgica de Peñarroya España S.A., was completed in 1977. The plant capacity has been increased to 205,000 tons of zinc per year.

During 1977, about one-half of the lead and zinc ore output was from northern Spain, and about one-third was from the District of Cartagena in southern Spain. The largest lead smelter was located near Santa Lucia, Cartagena, and was operated by Peñarroya. Asturiana de Zinc was the major producer of zinc in the country and operated the largest zinc plant in Spain at San Juan de Nieva.

Mercury.—Operating Almadén, the largest mercury mine in the world, Spain remained among the world's foremost mercury producers. Because of low prices of mercury, the Government, which operates Almadén, restricted sales to established customers. Production has not been affected by the low demand, and stockpiling continued.

Silicon.—A new facility for production of ferrosilicon went onstream in Huesca Province. The investor was Hidro Nitro Española S.A., which operates ferrosilicon-producing facilities with an annual capacity of 50,000 tons. Most of the new ferrosilicon production is slated for export.

NONMETALS

During 1977, Spain continued to produce a large variety of nonmetals. Potash, ocher, natural sodium sulfate, and celestite output were significant by European standards.

Digitized by Google

However, the importance of production of all other nonmetals was limited to the domestic economy.

Cement.—As in the past, Spain was a net exporter of cement during 1977. Approximately 15% of its cement output is exported to various countries on the American and African continents. Annual production capacity of the cement industry was 34 million tons at yearend.

The largest producer was Cía. General de Asfaltos y Portland, Asland S.A., headquarterod in Barcelona. Asland owned about 14% of the total cement capacity of Spain. Although Asland was the largest cement producer in Spain, Uniland of Barcelona operated the country's largest cement plant, a 2-million-ton-per-year facility in Barcelona.

Dunite.—Dunite output reached an all-time high of about 700,000 tons in 1977. This level of production was reached in a period of 5 years. The largest producer was Pasek España S.A., a subsidiary of S.A. Pasek & Cie. of Belgium-Luxembourg. Pasek operates the David mine in the Sierra de la Capelada District of La Coruña Province in northwestern Spain. Pasek produced a total of 600,000 tons of product with an average chemical composition of 37% to 38% MgO, 38% to 39% SiO_2, and about 8% Fe_2O_3 (with a 10% loss on ignition). The product was crushed and ground at a facility near Landoy to produce three principal grades: 0 to 3 millimeters, 0 to 5 millimeters, and 10 to 40 millimeters. Most of Pasek's products were shipped to customers in northern Spain and France.

Located in the same area was the Herbeira mine, near Ortigueirra, operated by Bunitas Industriales. Its 1977 output of about 100,000 tons of dunite was used in ENSIDESA's works at Àviles. A third dunite operation, a small mine at Narón near El Ferrol in La Coruña Province, was operated by Rocas Arcillas y Minerales S.A.

A dunite deposit near Málaga in southern Spain was explored, and successful blast furnace tests were completed with ores mined at Rond-Morbella. The deposits were too far from European markets to be commercial, but they were thought to have potential for supplying future needs of the iron and steel industry in the Mediterranean area.

Fertilizer Materials.—*Nitrogenous.*—During 1977, Soc. Española de Fabricantes Nitrogenades' (Sefanitro) plan to construct a 270,000-ton-per-year ammonia plant at Castellón was scrapped because of environmental concerns expressed by the local government. A new 900-ton-per-day ammonia plant at Huelva, designed by Kellogg International Corp. and owned by ERT, started operating during the year.

Potash.—The potash industry in Spain was working to increase its annual production capacity from 740,000 tons in 1977 to 1,035,000 tons of K_2O equivalent by 1982. The following tabulation shows current and planned production capacities by mine, in thousand tons:

	1977	1982
Navarra (Navarra Province)	315	395
Suria (Barcelona Province)	145	190
Llobregat (Barcelona Province)	180	250
Cardona (Barcelona Province)	100	200

Potasas de Navarra continued development of new zones within its potash deposit near Pamplona, and Minas de Potasa de Suria continued work toward opening a new mine nearby.

Pigments, Mineral.—Construction continued on a 12,000-ton-per-year plant at Málaga for production of superfine and micronized grades of red oxide. The investor was Oxidos Rojos de Málaga S.A. Ocher mines are situated in the Provinces of Jáen and Granada. In addition, rod, black, and yellow oxides are produced in the Saragora area. Most of the 1977 oxides production was exported.

Pyrite.—Exploration of a pyrite deposit near Sotiel, Huelva Province, continued during 1977. Results of operation of the new pilot plant for beneficiation of Sotiel's ores were not made public during the year. Construction of a plant for recovery of base metals, iron, and sulfur from pyrite continued. The plant is located near Huelva, and output was reported as follows: 900,000 tons of iron pellets, 10,000 tons of copper concentrates, 8,000 tons of lead concentrates, and 32,000 tons of zinc concentrates.

The principal producers of pyrite in Spain were mines in southern Spain operated by Unión Explosivos Rio Tinto S.A. (ERT) and Cía. de Azufre y Cobre de Tharis.

Salt.—Rock salt, salt from brines, and marine salt were sources of supply during 1977. The output was approximately 50% higher than in the early 1970's, as a result of a substantial increase in the capacity of Union Salinera de España S.A.'s solar salt plant at Torrevieja (Alicante Province). This plant produced between 500,000 and 1

Digitized by Google

million tons of salt by solar evaporation of seawater, from concentrated brine from the La Mata saline lagoon, and from saturated brine from the solution mining of a rock salt deposit at Pinoso, about 50 kilometers inland, which is pumped to the plant through a pipeline. The largest rock salt producer from salt mines was Solvay & Cie. of Belgium-Luxembourg, which operated mines at Torrevieja. Potasas de Navarra was the largest producer of byproduct salt from potash mining near Pamplona.

MINERAL FUELS

Petroleum, mostly imported, remained the principal source of energy in Spain. Coal was the principal mineral fuel produced in the country. Dependence on imported crude oil and other fuels was detrimental to Spain's balance of trade. Through the Second National Energy Plan, which was examined for submission to Parliament, the Government intended to lower consumption, reduce dependence on imports, diversify sources, and foster technological development in the energy industry. It also planned to establish new prices for energy products, support investments for improving certain industrial practices and equipment to curtail energy consumption or change the fuel used, and step up exploration, research, and participation in development of energy sources abroad to ensure sources of supply to meet the country's demand.

Table 5.—Spain: Supply and apparent consumption of fuels and power

(Million tons of standard coal equivalent[1])

	Total energy	Coal and coke	Petroleum and refinery products	Natural gas	Fuelwood	Hydroelectric and nuclear power
1975:						
Production	19.9	12.7	2.6	[2]	[2]	4.6
Imports	66.8	4.3	62.5	[2]	[2]	[2]
Exports	4.0	[2]	4.0	[2]	[2]	[2]
Apparent consumption	82.7	17.0	61.1	[2]	[2]	4.6
1976:						
Production	20.2	12.4	3.5	[2]	[2]	4.3
Imports	77.8	4.8	73.0	[2]	[2]	[2]
Exports	4.5	.1	4.4	[2]	[2]	[2]
Apparent consumption	93.5	17.1	72.1	[2]	[2]	4.3

[1] 1 ton standard coal equivalent (SCE) = 7 x 10^6 kilogram calories.
[2] Less than 0.01 million tons of standard coal equivalent.

Coal.—The expansion and renovation of existing coal mines continued. Higher coal output, planned to reach 34 million tons by 1980, remained the goal of Concerted Action Agreements between Government and industry. However, a new energy bill under discussion in Parliament may change output figures.

Development of the Meirama and Puentes de García Rodriguez lignite deposits, both in La Coruña Province, continued. The Meirama deposit, containing about 20 million tons of lignite with a calorific value of 2,000 kilocalories per kilogram, was to be developed as a 24-million-ton-per-year opencast mine. At the Puentes de García Rodriguez deposit, a 12.2-million-ton-per-year opencast mine was under development. Reserves on which the mine is based amount to 350 million tons of lignite having a calorific value of 1,800 kilocalories per kilogram.

During 1977, Spain produced anthracite, bituminous coal, and lignite. The Provinces of Oviedo and León were the largest producers of anthracite and bituminous coal. Most of the lignite was produced in the Provinces of Teruel, Barcelona, and La Coruña. Imports of coal, mostly coking coal, were an important part of the country's supply.

Petroleum and Natural Gas.—During 1977, Spain remained almost totally dependent on imported crude oil and natural gas to meet its demand. Domestic output of crude oil was modest, amounting to approximately 2% of petroleum refinery input of about 48 million tons. Petroleum refineries operated at about 80% of installed capacity in 1977.

Offshore exploration for crude oil and natural gas was intensive. The high cost of imported crude oil, which adversely affected the balance of trade, made domestic production, even at relatively high costs, more attractive than in the past. Exploration,

Digitized by Google

both seismic and drilling, was conducted in the Mediterranean Sea and the Bay of Biscay. The most important result was discovery of oil by Chevron Oil Co. some 6 kilometers from the Casablanca IA production well in the Mediterranean Sea. The well, named Montanaza D-1, flowed during the test at a rate of about 9,504 barrels per day from depths of 2,592 to 2,612 meters. This new find indicated that the western part of the Mediterranean Sea may have some potential for oil production.

Ten petroleum refineries, with a combined installed annual capacity of 59.6 million tons, were in operation in 1977, distributed as follows in million tons:

Company	Location	Capacity
Empresa Nacional del Petróleo, S.A. (ENPETROL).	Escombreras	10
	Puertollano	6
	Tarragona	7
Cia. Ibérica Refinadora de Petróleos, S.A. (PETROLIBER).	La Coruña	5
Cia. Española de Petróleos, S.A. (CEPSA).	Santa Cruz de Tenerife.	8
	Algeciras	6.5
Petróleos del Mediterraneo, S.A. (PETROMED).	Castellón de la Plana.	4
Unión Explosivos Rio Tinto, S.A. (ERT).	Huelva	4
Refinería de Petróleos del Norte, S.A. (PETRONOR).	Somorrostro	8
Asfaltos Españoles S.A. (ASESA)	Tarragona	1.1

During 1977, several refineries were given permission to increase installed capacities. At the Somorrostro refinery, capacity is to be increased from 8 million tons to 12 million tons of crude oil per year by late 1978 or early 1979. The capacity of the petroleum refinery at Algeciras is to be increased to 8 million tons of crude oil per year.

The domestic output of natural gas was far below the country's demand. Foreign liquefied natural gas, supplied mostly by SONATRACH of Algeria, was the principal source of supply. To assure a continuous flow of gas to consumers in northern Spain, an 865-kilometer-long pipeline is being built in sections starting at Barcelona. Most advanced was the line from the regasification plant at Barcelona to Tarragona. It was hoped that natural gas would reach Tarragona sometime in 1978. The section from Castelnou to Mora de Ebro and Haro was progressing well. However, construction of the last 137 kilometers to Bilbao has been delayed by right-of-way litigations.

The idea of constructing a gas pipeline between Spain and Algeria was kept alive by studying possible routes for the line. At yearend, no firm decision had been made. Soc. de Estudios del Gasoducto Mediterráneo Occidental, formed in 1972 by SONATRACH (50%), Gaz de France (25%), and ENAGAS (25%), financed the studies during 1977.

Uranium.—Areas near Ciudad Rodrigo remained the principal territories for uranium exploration and production. Most active in the area was Empresa Nacional del Uranio S.A. Although construction of nuclear powerplants continued, the ambitious national plan for development of nuclear energy was under study for incorporation into the energy plan to be presented to Parliament. At yearend, three nuclear powerplants (1,120 megawatts electric) were in operation and five powerplants (6,555 megawatts electric) were under construction.

The Mineral Industry of Sudan

By Candice Stevens[1]

The mineral industry of Sudan made a minor contribution to the gross national product (GNP) of approximately $4.3 billion[2] in 1977. However, the new 6-year development plan (1977-82) was to provide the foundation for the exploitation of Sudan's promising mineral potential. Approximately 25% of the total expenditure of $6.5 billion was to be allocated to the mining and manufacturing sector. Major goals were intensification of mineral exploration, promotion of private investment, and development of basic infrastructure. Projects included a major increase in cement capacity, further development of chromite, gold, and mica mining, and construction of a fertilizer complex and a petroleum refinery. Occurrences of copper, asbestos, manganese, uranium, and lead-zinc were to be further evaluated as were indications of oil and gas.

The Sudanese Government initiated an economic stabilization program designed to reduce the inflation rate, decrease the serious balance-of-payment deficit, and promote greater financial discipline. In 1977, Sudan was attempting to reschedule payment of its foreign debts, estimated to total $1.5 billion. Sudan received a loan of $62.8 million from the International Monetary Fund on the basis of the country's new fiscal and monetary policies.

Sudan actively sought investment from other countries under the Development and Promotion of Industrial Investment Act. This legislation included 3- to 10-year tax holidays for foreign investors, exemption from customs and other duties, full repatriation of profits in case of liquidation, and safeguards against arbitrary confiscation and nationalization. Earlier provisions placing restrictions on mineral prospectors were removed in 1977, and a new mining and investment code was under consideration. The Sudanese-American Council for Cooperation, established in 1976 after the United States and Sudan resumed diplomatic ties, was responsible for aiding investors and promoting closer economic ties between the two countries.

A major focus of investment was the development of Sudan's infrastructure. A $64 million project, funded largely by the International Bank for Reconstruction and Development (IBRD), was to modernize and expand facilities at Port Sudan. Work was to include the mechanization of cargo handling and was to result in increased physical capacity and operational productivity, and improved management capability by 1981. Construction continued on the 750-kilometer all-weather road linking Port Sudan and Khartoum. Cofinanced by the Sudanese Government and the Saudi Arabian Development Fund, the road was to be opened in 1978. Norway agreed to finance a feasibility study for a 230-kilometer road linking Kitale in Kenya to Juba in southern Sudan. This road would give southern Sudan direct access to the Kenyan port of Mombasa and provide an alternative transport route. A long-term plan to overhaul and modernize Sudan's 3,500-kilometer narrow-gage railroad was in progress.

PRODUCTION AND TRADE

Chromite and refined petroleum products remained Sudan's most important mineral commodities. Manganese, gold, and mica were mined on a small scale. Cement pro-

Digitized by Google

duction was based on local gypsum deposits, and salt was produced largely for export. The production of minerals in Sudan is given in table 1.

Sudan continued to evidence a balance-of-trade deficit of approximately $400 million in 1977, owing to increased outlays for food and petroleum imports. Chrome was exported primarily to Japan, Switzerland, and the People's Republic of China. Exports of chrome, salt, and refined petroleum products contributed about 6% of the total export value. Refined petroleum products were imported from Kuwait, and fertilizer was imported under a long-term supply agreement with Kuwait Chemical Fertilizer Co. Approximately 8 million barrels of crude oil for refining were imported under a 5-year contract with Iraq. Under new supply agreements concluded in 1977, crude oil was to be imported from Saudi Arabia, Egypt, and the United Arab Emirates in future years.

Table 1.—Sudan: Production of mineral commodities

Commodity[1] and unit of measure	1975	1976	1977[p]
Cement, hydraulic thousand metric tons	216	130	137
Chromium: Chromite concentrate, gross weight metric tons	15,000	21,000	17,273
Gold, mine output, metal content[e] troy ounces	300	300	300
Gypsum and anhydrite, crude[e] metric tons	[r]30,000	18,000	4,140
Magnesite, crude[e] do.	100	100	--
Manganese ore do.	--	458	457
Mica, all grades do.	[e]250	550	[e]400
Petroleum refinery products:			
Gasoline thousand 42-gallon barrels	971	1,022	1,170
Jet fuel do.	368	390	275
Kerosine do.	277	285	267
Distillate fuel oil do.	3,232	2,348	2,440
Residual fuel oil do.	2,538	3,174	3,347
Other do.	404	135	42
Refinery fuel and losses do.	531	640	362
Total do.	8,321	7,994	7,903
Salt metric tons	66,000	70,000	91,713

[e]Estimate. [p]Preliminary. [r]Revised.

[1]In addition to the commodities listed, modest quantities of a variety of crude construction materials (including clays, stone, and sand and gravel) presumably were also produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

Table 2.—Sudan: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1976
Copper metal scrap	188
Iron and steel metal scrap	450
Lead metal scrap	598
Ores and concentrates of base metals	26,080
Salt	1,288
Sodium carbonate, natural	1,980
Petroleum refinery products: Residual fuel oil	1,332

COMMODITY REVIEW

METALS

Several foreign interests were involved in mineral surveys, mapping, and exploration under the auspices of the Geological and Minerals Resources Department (GMRD). Hunting Geology and Geophysics Ltd. (United Kingdom) continued its general mineral survey in southern Sudan. The focus was on metals and industrial minerals such as limestone, asbestos, clay, and talc. Under a protocol signed in 1976, the U.S.S.R. conducted gravimetric and magnetic surveys in 75,000 square kilometers on the Red Sea coast. Manganese and iron deposits along the coast were to be evaluated in a 2-year period.

The Bureau de Recherches Géologiques et Minières (BRGM) of France began a 3-year assessment of the mineral resources of the Red Sea coastal area. France would bear all costs of this project, which is to assess the commercial potential of gold, chrome, iron, and magnesium deposits. The Federal Republic of Germany continued its mapping and prospecting program for base metals in a 40,000-square-kilometer area of the Bayuda Desert. The United Nations Revolving Fund for Natural Resource Exploration was conducting feasibility studies of iron ore and manganese deposits in the Red Sea coastal area and copper deposits at Hofrat en Nahas.

The Saudi-Sudanese Commission for the Exploitation of Red Sea Resources planned to spend $17 million in 1978 on experimental dredging of Red Sea sediments. Sampling indicated approximately 50 million tons of metalliferous bottom sediments including zinc, copper, and silver. Preussag A.G. (Federal Republic of Germany) was to conduct overall feasibility studies on seabed mineral exploitation. The BRGM was to act as technical consultant to the project.

Chromite.—Chromite production in the Ingessana Hills in southeastern Blue Nile Province was approximately 17,000 tons in 1977. The Government-owned Ingessana Hills Mines Corp. had a capacity of 15,000 to 20,000 tons per year in underground workings. The State planned to invest $2.5 million to double annual output by 1978. Privately owned Blue Nile Chromium Ltd. had a capacity of 5,000 tons per year in small opencast workings.

In 1977, Mitsubishi Corp., in partnership with Japan Metals & Chemicals Co. Ltd., began a $1 million feasibility study of the development of additional chromite reserves in the Ingessana Hills area. Earlier drilling by the Japanese indicated large reserves grading 35% to 40% chrome. A potential joint venture to mine 200,000 tons per year of chrome would be owned 51% by Sudan and 49% by the Japanese companies. The Japanese would have the right to 49% of production and first option to the remainder. A further element of the contract was the possible construction of a ferrochrome industry in Sudan.

Gold.—Gold mined at the Gebeit mine in the Red Sea Hills and from smaller alluvial deposits totaled about 300 troy ounces per year. There were over 75 known gold occurrences in Sudan, primarily in the northeast. The last of the producing gold mines closed down regular production in 1974, and gold was mined largely by primitive means by local natives. The possibility of reopening the gold workings in the Serakoit region was under study by the British firm Robertson Research International Ltd.

Iron Ore.—Feasibility studies were being conducted of Sudan's two main iron ore deposits. The Fodikwan deposit, located north of Port Sudan, was estimated to contain 50 million to 100 million tons of ore with an average iron content of 35% to 40%. The Sufaya deposit, located in the northern Red Sea Hills, was estimated to contain 6 million tons of ore averaging 60% to 63% iron. Iron has been mined in this area by individual workers for many centuries.

Manganese.—Manganese was produced on a small scale in the Red Sea Hills and coastal area. Approximately 28 manganese occurrences have been identified in Sudan, with manganese contents between 47% and 55%. Studies were in progress to determine if some of these occurrences would support large-scale development. In 1977, production was approximately 460 tons of ore averaging 48% manganese.

Uranium.—Three firms were actively involved in uranium exploration in Sudan in 1977. Agip S.p.A. was reported to have located deposits near Hofrat en Nahas containing 10 million tons of copper and uranium ore. No grade was reported. Wyoming Mineral Corp., a subsidiary of Westinghouse Electric Corp. (United States), was exploring for uranium in a 290,000-square-kilometer concession area in Darfur and

Digitized by Google

Northern Provinces. Essex Minerals Co., a subsidiary of United States Steel Corp., was also engaged in uranium prospecting under a 1976 contract.

NONMETALS

Asbestos.—Johns-Manville Corp. (United States), in conjunction with Gulf International Co., began drilling for asbestos in the Qala en Nahl area near the Ethiopian border. Reserves of chrysotile-type asbestos in serpentine rocks were estimated at 20 million tons of ore averaging 5% asbestos. Johns-Manville held a 10,000-square-kilometer concession area in Blue Nile and Kassala Provinces. A $3.6 million feasibility study for a plant to produce 100,000 tons of asbestos fiber per year was planned.

Cement.—Cement production was approximately 137,000 tons in 1977 as Sudan continued to rely heavily on imported cement. Maspion Cement Corp., located at Atbara in Northern Province, was to undergo an increase in capacity from 225,000 tons to 500,000 tons per year. Increased capacity was also planned for Nile Cement Co. at Rabak from 60,000 tons to 100,000 tons per year. Work began on the Red Sea Cement Co. plant at Derudeb, which was to produce 500,000 tons per year of cement by 1980.

Fertilizer Materials.—Construction of Sudan's first ammonia-urea complex, announced in 1973 but delayed by financing problems, was to begin in 1978. The $125 million plant was a joint venture of the Sudanese Government (65%) and N-Ren International (35%). Located 11 kilometers south of Khartoum, the Sudan-Ren Chemicals and Fertilizer Co. plant was to have a capacity of 200 tons per day of ammonia and 300 tons per day of urea. Construction by Vöest-Alpine AG (Austria) was to be financed by loans from Austria, Canada, and the Federal Republic of Germany. Naphtha for feedstock would be transported from the Port Sudan refinery by the new Port Sudan-Khartoum pipeline. Fertilizer production would serve the main consumption area around the Gezira agricultural project and the Kenana sugar scheme.

Mica.—About 400 tons of mica was produced from pegmatites in the eastern Bayuda Desert in the vicinity of Shereik. With the support of the United Nations Minerals Project, a small-scale operation was established in 1974 to develop the mica deposits. Construction of a plant to dry-grind mica scrap was under construction.

MINERAL FUELS

Petroleum.—The Port Sudan refinery, owned 50% by the Sudanese Government and 50% by Royal Dutch/Shell and British Petroleum Co. Ltd., produced about 8 million barrels of petroleum products in 1977. A second refinery was under construction at Port Sudan as a joint venture between the Sudan Government and the Saudi firm Triad Naft Co. Ltd. The cost of this 200,000-barrel-per-day refinery was estimated at $250 million.

In December, the 815-kilometer pipeline linking Port Sudan and Khartoum was officially commissioned. Financed by a $75 million loan from Kuwait, the pipeline was to carry petroleum products to the interior and would free fuel-carrying rolling stock on the Port Sudan-to-Khartoum railway. Initial capacity of the pipeline was to be 600,000 tons per year, later to be expanded to 850,000 tons per year.

Chevron Overseas Petroleum Inc., a subsidiary of Standard Oil Co. of California, expanded its petroleum exploration efforts in Sudan. In partnership with Texaco Sudan Inc., Chevron made two gas discoveries at Suakin and Bashayer on the Red Sea coast near Port Sudan. Reserves were estimated at 130 billion cubic feet of gas at Suakin and 48 billion cubic feet at Bashayer.

Chevron also made an oil discovery near Bentiu in its 516,000-square-kilometer concession area in south-central Sudan. Drilling was to continue in the area in 1978. Chevron's petroleum exploration license was transformed into a production-sharing contract in 1976 that provided for the Sudanese Government to acquire 70% to 75% of any exploitation venture.

The Mineral Industry of Sweden

By Joseph B. Huvos[1]

The mineral industry of Sweden is small but technologically advanced. The country is one of the world's largest iron ore producers, and there is significant production of nonferrous metals. Fossil fuels are imported.

Indices of Swedish mineral industry production (1968=100) in 1976 and 1977 are shown in the following tabulation:

Industry sector	1976[r]	1977[p]
Iron ore mining	113	93
Nonmetallic mineral products	92	93
Base metal industries	121	108
Mining, quarrying, manufacturing	130	127

[p]Preliminary. [r]Revised.

Source: Monthly Digest of Swedish Statistics. No. 3, 1978, p. 13.

In 1977, the Swedish economy suffered from weak foreign demand (mainly for investment goods) and another sizable increase in unit labor costs, which was not alleviated by two devaluations of the Swedish krona. Sweden's gross national product (GNP) in 1977 was about $73 billion.[2 3] The current foreign trade deficit was $7.9 billion. Unemployment was maintained by subsidies at under 2% of the work force.

Significant developments in Sweden's mineral industry in 1977 included reorganization of its steel industry with the formation of Svenskt Staal AB (SSAB); continuation of development work at Soc. des Mines et Fonderies de Zinc de la Vieille-Montagne's Zinkgruvan mine, A/B Statsgruvor's tungsten mine, and the Svappavaara iron ore concentrator; allocation of funds for development of Luosavaara-Kiirunavaara AB's (LKAB) copper deposit at Viscaria and its Kiirunavaara apatite-processing plant; and closure of Boliden AB's Adak copper mine and Ställberg Grufveaktieblag's three iron ore mines.

PRODUCTION

In 1977, many minerals were produced at a low level. Production of mineral commodities for 1975-77 is shown in table 1.

TRADE

There was no major change during 1977 in Sweden's mineral trade pattern; Scandinavian and Western European countries remained as its primary trading partners. The principal commodities exported were iron and steel, iron ore, and nonferrous metals. Sweden's mineral commodity trade in 1975 and 1976 is shown in tables 2 and 3.

Major mineral imports from the United States were coal, iron and steel semimanufactures, nonferrous metals, and fertilizers. Mineral exports to the United States included mainly nonferrous ores and metals and iron and steel semimanufactures. United States-Swedish trade in 1976 is shown in table 4.

Table 2.—Sweden: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Bauxite and concentrate	750	1,150	Norway 852; Finland 298.
Alumina	19	4	NA.
Metal including alloys:			
Scrap	1,250	1,897	West Germany 1,112; Denmark 321; France 200.
Unwrought	8,019	13,337	Norway 7,672; West Germany 1,572; Japan 1,396.
Semimanufactures	31,955	45,350	Denmark 8,922; United Kingdom 6,798.
Arsenic oxide and acids value, thousands	$3,059	$1,053	NA.
Chromium ore and concentrate	--	42	All to West Germany.
Copper:			
Ore and concentrate	9,820	32,064	East Germany 21,248; Bulgaria 10,766.
Metal including alloys:			
Scrap	932	1,053	France 409; West Germany 327; Finland 198.
Unwrought	22,202	36,269	United Kingdom 10,348; West Germany 8,868; Finland 5,388.
Semimanufactures	46,308	47,030	United States 8,882; Norway 8,861; Denmark 8,825.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	23,081	22,030	West Germany 5,288; United Kingdom 4,516; Belgium-Luxembourg 4,504.
Roasted pyrite do	430	388	United Kingdom 198; West Germany 121; Belgium-Luxembourg 41.
Metal:			
Scrap do	11	9	West Germany 5; Denmark 2; Belgium-Luxembourg 1.
Pig iron, including cast iron do	283	158	Poland 46; West Germany 14; Italy 14; United Kingdom 14.
Ferroalloys do	67	83	United Kingdom 44; West Germany 11.
Steel, primary forms do	120	165	West Germany 51; Finland 47; United States 32.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	457	264	Denmark 51; United Kingdom 45; Finland 38; Norway 32.
Universals, plates, sheets do	737	653	West Germany 131; United Kingdom 106; Denmark 104.
Hoop and strip do	69	74	Denmark 12; West Germany 10; United States 7.
Rails and accessories do	25	19	Norway 7; East Germany 5; West Germany 2.
Wire do	58	69	West Germany 11; United States 11; United Kingdom 6.
Tubes, pipes, fittings do	200	23	West Germany 4; Norway 3; Denmark 2.
Castings and forgings, rough do	3	27	Norway 7; Denmark 5; Finland 3.
Lead:			
Ore and concentrate	49,520	61,036	West Germany 52,829.
Oxide	293	245	NA.
Metal including alloys, all forms	28,188	39,492	West Germany 22,806.
Magnesium metal including alloys:			
Scrap	299	301	United States 130; West Germany 71; Netherlands 65.
Unwrought and semimanufactures	--	5	Denmark 2; West Germany 1.
Mercury 76-pound flasks	145	464	United States 319; Norway 145.
Molybdenum ore and concentrate	884	730	United Kingdom 313; West Germany 156; Finland 82.

Gasoline, aviation and motor thousand 42-gallon barrels	1,413	2,091	Norway 1,081; Denmark 911.
Kerosine and jet fuel do	347	119	Norway 67; Finland 52.
Distillate fuel oil do	3,466	2,981	Denmark 1,806; Norway 802; West Germany 301.
Residual fuel oil do	5,403	7,369	Denmark 6,345; Norway 403; United Kingdom 391.
Lubricants do	452	414	Norway 160; Denmark 84; Finland 78.
Other:			
Liquefied petroleum gas do	153	247	Denmark 161; Norway 70.
Naphtha do	NA	243	United Kingdom 190.
Mineral jelly and wax do	NA	1	Mainly to Norway.
Petroleum coke, asphalt, bitumen do	249	181	Denmark 107; Norway 33.
Unspecified do	149	47	Mainly to Denmark.
Total do	11,632	13,693	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	18,019	187,896	Norway 54,427; Denmark 49,993; West Germany 35,664.

[r]Revised. NA Not available.

Table 3.—Sweden: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite and concentrate	68,042	38,523	Australia 16,397; Guyana 12,007; Greece 4,872.
Alumina	220,221	189,849	Jamaica 129,273; West Germany 30,395.
Metal including alloys:			
Scrap	1,140	1,179	Poland 741; Norway 143.
Unwrought	43,772	46,766	Norway 27,156; Ghana 6,892.
Semimanufactures	48,546	58,557	Norway 15,507; Austria 6,462.
Chromium:			
Chromite	395,735	377,465	Finland 128,949; U.S.S.R. 127,120; Philippines 40,179.
Oxide and hydroxide	2,250	840	West Germany 394; U.S.S.R. 91.
Copper:			
Ore and concentrate	56,387	57,946	Norway 19,067; Canada 14,376; Philippines 11,271.
Matte	6,685	8,643	Mainly from France.
Metal including alloys:			
Scrap	8,485	3,189	France 1,123; United States 457; Finland 414.
Unwrought	75,003	69,534	Zambia 15,880; Belgium-Luxembourg 12,173; Canada 11,476.
Semimanufactures	28,461	32,696	United Kingdom 9,805; West Germany 7,410; Finland 5,984.
Iron and steel:			
Ore and concentrate, except roasted pyrite	319,000	189,000	Mainly from Liberia.
Metal:			
Scrap	338,144	137,046	U.S.S.R. 71,339; West Germany 14,762; Denmark 13,942.
Pig iron, including cast iron	223,820	235,380	East Germany 50,362; Finland 39,559; India 37,106.
Ferroalloys	185,590	175,948	Norway 75,126; Republic of South Africa 23,190.
Steel, primary forms	216,602	464,395	Finland 165,923; West Germany 94,859.
Semimanufactures:			
Bars, rods, angles, shapes, sections	783,618	415,215	West Germany 85,869; Belgium-Luxembourg 69,284; France 55,331.
Universals, plates, sheets	1,039,392	1,161,306	Japan 267,621; West Germany 192,264.
Hoop and strip	102,585	124,943	Poland 36,682; West Germany 21,072.
Rails and accessories	5,140	3,924	West Germany 2,613; United Kingdom 976.
Wire	106,394	24,549	Belgium-Luxembourg 5,492; United Kindgdom 5,087; Austria 4,677.
Tubes, pipes, fittings	33,134	41,409	West Germany 16,973; United Kingdom 7,814; France 6,804.
Castings and forgings, rough	13,690	41,194	Poland 10,694; West Germany 6,218.
Total	2,083,953	1,812,540	
Lead:			
Oxide	2,917	3,112	West Germany 1,394; United Kingdom 1,070; Denmark 408.
Metal including alloys:			
Scrap	1,452	2,456	Norway 2,309.
Unwrought	4,673	4,572	United Kingdom 1,588; Denmark 1,235; West Germany 640.
Semimanufactures	1,298	1,294	West Germany 894; Belgium-Luxembourg 267.
Magnesium metal including alloys:			
Unwrought, including scrap	1,653	1,378	Norway 1,188; United States 150.
Semimanufactures	116	48	France 19; West Germany 17.
Manganese:			
Ore and concentrate	35,113	40,101	U.S.S.R. 31,220; Republic of South Africa 8,447.
Oxide	1,528	866	People's Republic of China 290; Japan 245; Belgium-Luxembourg 142.
Mercury 76-pound flasks	1,479	2,147	Spain 1,543; U.S.S.R. 289.
Molybdenum:			
Ore and concentrate	6,980	7,477	Netherlands 3,244; United States 2,845.
Metal including alloys, all forms	74	50	West Germany 14; Poland 12; Austria 4.
Nickel:			
Matte	2,602	4,651	Australia 3,034; U.S.S.R. 1,080.
Metal including alloys:			
Scrap	1,927	3,464	Switzerland 1,370; United States 1,143; United Kingdom 542.
Unwrought	13,940	11,268	United Kingdom 3,203; Australia 2,124; Norway 1,326.
Semimanufactures	6,648	4,879	Netherlands 3,245; United Kingdom 589.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Platinum-group metals and silver:			
Ores and concentrates	1,560	738	Peru 458; Colombia 280.
Waste and sweepings	154	88	United States 47; France 35.
Metals including alloys, unwrought or partly worked:			
Platinum-group value, thousands	$9,064	$8,365	Switzerland $3,106; West Germany $2,161; United Kingdom $1,764.
Silver do	$26,576	$20,659	United Kingdom $9,522; West Germany $5,247; Norway $3,574.
Tantalum do	$210	$31	West Germany $12; Belgium-Luxembourg $8; United States $5.
Tin:			
Scrap	--	46	All from Norway.
Oxide	41	43	United Kingdom 24; West Germany 19.
Metal including alloys:			
Unwrought, including scrap	805	878	Malaysia 315; United Kingdom 285.
Semimanufactures	243	260	United Kingdom 164; West Germany 74.
Titanium:			
Ore and concentrate	4,234	3,075	All from Australia.
Oxide	3,590	3,504	Finland 1,038; France 534; Norway 467.
Tungsten:			
Ore and concentrate	3,679	3,201	People's Republic of China 958; Thailand 610; Brazil 539.
Metal including alloys, all forms	103	117	United Kingdom 55; Belgium-Luxembourg 25; United States 14.
Zinc:			
Ore and concentrate	--	8,221	NA.
Oxide	1,525	1,760	Netherlands 496; East Germany 335; Poland 255.
Metal including alloys:			
Blue powder	582	514	Norway 455.
Scrap	227	193	Norway 143; Denmark 50.
Unwrought	48,357	43,592	Norway 19,364; Finland 13,317.
Semimanufactures	1,043	978	West Germany 715.
Other:			
Ores and concentrates	836	943	Austria 892.
Ash and residue containing nonferrous metals	46,295	29,368	West Germany 16,988; France 5,397; Netherlands 3,069.
Oxides, hydroxides, peroxides of metals	1,953	2,354	United Kingdom 726; Finland 695; West Germany 308.
Metals including alloys, all forms	9,291	6,649	Republic of South Africa 1,951; West Germany 1,138; France 749.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	2,172	308	Italy 137; West Germany 84; Netherlands 40.
Dust and powder of precious and semiprecious stones value, thousands	$2,070	$1,470	United States $678; Republic of South Africa $368; United Kingdom $238.
Grinding and polishing wheels and stones	3,870	2,804	Austria 852; United Kingdom 769; West Germany 372.
Asbestos	15,529	10,366	Canada 7,208; Cyprus 2,087.
Barite and witherite	5,405	6,153	West Germany 3,141; United Kingdom 2,458.
Boron:			
Crude natural borates	17,726	20,148	United States 13,460; Turkey 6,687.
Oxide and acid	920	703	United States 348; France 325.
Cement	20,187	20,667	Denmark 9,796; Finland 4,470; West Germany 2,592.
Chalk	17,620	17,379	Denmark 7,344; France 5,378; West Germany 4,177.
Clays and clay products (including all refractory brick):			
Crude	274,523	272,594	United Kingdom 223,306.
Products:			
Refractory (including nonclay brick)	165,026	131,533	United Kingdom 35,253; West Germany 32,873; Austria 28,201.
Nonrefractory	32,794	34,536	Denmark 8,936; Italy 7,176; West Germany 6,359.
Cryolite and chiolite	502	1,008	All from Denmark.
Diamond:			
Gem, not set or strung value, thousands	$12,220	$12,780	Belgium-Luxembourg $7,259; Israel $2,135.
Industrial do	$1,645	$881	United Kingdom $413; Republic of South Africa $287.
Diatomite and other infusorial earth	4,147	4,063	United States 2,085; Denmark 1,131.
Feldspar, fluorspar, etc	17,845	26,857	France 7,034; Norway 6,658; People's Republic of China 5,572.

Table 3.—Sweden: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
NONMETALS —Continued			
Fertilizer materials:			
Crude:			
Nitrogenous	19,256	12,595	Mainly from Chile.
Phosphatic	675,832	580,913	Morocco 262,830; U.S.S.R. 228,496; United States 84,137.
Manufactured:			
Nitrogenous	655,414	543,374	Norway 489,949.
Phosphatic	NA	828	All from Israel.
Potassic value, thousands	(1)	$16,420	West Germany $5,858; U.S.S.R. $4,833; East Germany $3,518.
Other, including mixed	104,190	98,914	Norway 77,394; West Germany 7,900; United States 5,652.
Ammonia	102,074	85,566	Norway 39,241; East Germany 17,322; West Germany 17,293.
Graphite, natural	861	1,501	United Kingdom 446; West Germany 379; People's Republic of China 275.
Gypsum and plaster	295,396	219,879	U.S.S.R. 93,994; Spain 83,547; Poland 32,081.
Lime	3,476	2,948	Norway 1,409; Denmark 622; West Germany 590.
Magnesite	2,860	7,073	U.S.S.R. 3,760; United Kingdom 909.
Mica, all forms	738	652	Norway 232; India 140; Switzerland 77.
Pigments, mineral, processed:			
Natural, crude	122	68	West Germany 28; France 17; United Kingdom 10.
Iron oxides	5,764	7,627	West Germany 6,874.
Precious and semiprecious stones, except diamond value, thousands	$914	$1,061	West Germany $254; Switzerland $218.
Pyrite, unroasted	81,116	102,223	Mainly from Norway.
Salt and brine thousand tons	1,224	1,210	Netherlands 487; West Germany 343; United Kingdom 183.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	51,772	37,850	Belgium-Luxembourg 28,404; West Germany 6,442.
Caustic potash	1,278	962	West Germany 673; France 247.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Marble and other calcareous	760	600	Italy 353; Belgium-Luxembourg 157; Norway 75.
Slate	1,495	1,282	Norway 1,143.
Other, including granite, gneiss, etc	3,412	2,907	Norway 1,305; Finland 1,244.
Worked, all types	9,586	11,128	Portugal 4,489; Poland 2,490; Italy 2,089.
Dolomite	29,633	61,891	Norway 43,884; United Kingdom 12,115.
Gravel and crushed stone	88,544	68,027	Denmark 22,105; Finland 18,769; Norway 17,312.
Limestone (except dimension)	97,487	79,743	United Kingdom 53,909; Denmark 23,519.
Quartz and quartzite	43,298	58,273	Spain 46,280; Greece 8,746.
Sand, excluding metal bearing	301,007	545,970	Denmark 237,650; Finland 167,183; Belgium-Luxembourg 124,399.
Sulfur:			
Elemental, all forms	94,049	69,569	Poland 54,749; Finland 8,430.
Sulfuric acid, including oleum	75,209	18,238	Finland 17,445.
Sulfur dioxide	8,752	5,067	Finland 1,931; West Germany 1,907; Norway 1,229.
Talc, steatite, soapstone, pyrophyllite	22,305	22,872	Norway 12,210; Austria 3,653; Belgium-Luxembourg 2,671.
Other:			
Crude	97,313	96,456	Norway 50,534; West Germany 35,345.
Slag, dross, and similar waste, not metal bearing	2,968	19,757	Denmark 13,739; West Germany 3,263; Netherlands 2,509.
Oxides and hydroxides of magnesium, strontium, barium	20,981	18,114	Norway 11,435; Spain 2,025.
Bromine, iodine, fluorine	20	14	Chile 9; Japan 2.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	877	788	United States 437; Trinidad and Tobago 350.
Carbon black	8,693	8,291	West Germany 5,083; United Kingdom 1,281; Netherlands 1,177.
Coal and briquets:			
Anthracite and bituminous coal thousand tons	1,632	2,018	United States 789; U.S.S.R. 576; Poland 381.
Lignite and lignite briquets	15,026	9,802	Poland 6,256; West Germany 2,021; East Germany 1,525.
Coke and semicoke thousand tons	1,202	1,099	West Germany 562; United Kingdom 282.

Commodity	1975	1976	Principal sources, 1976
MINERAL FUELS AND RELATED MATERIALS —Continued			
Hydrogen, helium, rare gases	1,480	3,720	West Germany 1,406; Netherlands 1,069; United Kingdom 454.
Peat and peat briquets	775	2,197	U.S.S.R. 1,236; Finland 844.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	84,980	100,384	Saudi Arabia 20,825; Iran 19,162; United Arab Emirates 13,976.
Refinery products:			
Gasoline, aviation and motor ---do---	19,245	12,575	Denmark 4,043; United Kingdom 1,904; Finland 1,628.
Kerosine and jet fuel ---do---	2,542	4,342	United Kingdom 2,200; Netherlands 869; U.S.S.R. 449.
Distillate fuel oil ---do---	43,846	44,632	United Kingdom 8,741; U.S.S.R. 7,077; Venezuela 5,619.
Residual fuel oil ---do---	58,331	48,899	U.S.S.R. 16,639; United Kingdom 5,707; Netherlands 5,284.
Lubricants ---do---	1,080	1,715	Netherlands 408; United Kingdom 324; West Germany 245.
Other:			
Liquefied petroleum gas ---do---	744	477	Netherlands 138; United Kingdom 113; Kuwait 92.
Naphtha ---do---	7,564	10,060	Saudi Arabia 3,222; Italy 1,753; Netherlands 1,551.
Mineral jelly and wax ---do---	153	100	West Germany 51; East Germany 10.
Petroleum coke, asphalt, bitumen do---	1,033	1,004	Denmark 393; United States 290; West Germany 249.
Unspecified ---do---	1,166	1,682	Venezuela 907; U.S.S.R. 613.
Total	135,704	125,486	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	58,208	52,254	United Kingdom 14,542; Netherlands 10,939; West Germany 8,794.

NA Not available.
[1]Quantity reported as 1,344 tons.

COMMODITY REVIEW

METALS

Aluminum.—A sluggish economy decreased sales to under the 1976 level. The country's only aluminum reduction plant, located at Sundsvall on the Baltic and controlled by Gränges Aluminium AB, was operating at about 96% of its capacity of about 85,000 tons per year. Semimanufactures production was at 70% to 85% of capacity.

Copper, Lead, Zinc.—In 1977, Boliden made extensive rationalization moves at its Renström copper-lead-zinc mine located near Boliden. The company also completed expansion of its Laisvall lead-zinc mine in Norrbotten County, bringing its annual production capacity to 1.4 million tons of ore. Alteration work was begun on the Laisvall concentrating plant to allow extraction of a selective zinc concentrate. Operations at the company's Adak copper mine were terminated, and the mine installations were dismantled.

The Belgian firm Vieille-Montagne, the only foreign-owned mining company operating in Sweden, obtained a Swedish Government dispensation in 1977 to purchase a number of claims. At the company's Zinkgruvan mine, located at the northern tip of Lake Vättern near AAmmeberg, preparatory work on the 500- and 650-meter levels was intensified for full-scale operation during 1979-80. All ore that carries lead, zinc, and copper values is now treated aboveground in the new concentration plant.

The Swedish Government decided to approve LKAB's $90 million investment program for 1978 (see Iron Ore). A considerable share of the money would be allocated for construction of a copper extraction plant at the newly discovered Viscaria deposit west of Kiruna, where more than 24 million tons of ore with an average copper content of 1% was found.

Boliden obtained a concession to prospect for minerals in the Gulf of Bothnia. An aerial geodetic survey was carried out during the summer of 1977 in an area located between the towns of Lovänger and Pitea

and the longitudinal axis of the Gulf.

Prospecting for copper included drilling and mapping greenstone areas west of Kiruna, where deposits similar to those at Viscaria were found. Prospecting costs for the Swedish Geological Survey were about $13 million during 1976-77 and were to increase about $700,000 annually during 1977-78 and 1978-79. The Government decreased uranium prospecting expenditures from 30% to 15% of total prospecting costs.

In 1977, Boliden continued to account for most of the nonferrous metals mined and produced in Sweden, and it operated the country's only large nonferrous smelter at Rönnskär near Skelleftea on the Gulf of Bothnia. Vieille-Montagne accounted for 30% of the zinc ore produced, which was exported for processing in the company's Belgian plants.

Swedish nonferrous ore mines with a capacity of more than 150,000 tons per year are shown in the following tabulation:

Digitized by Google

Company and name of mine[1]	Location	Capacity (thousand metric tons per year)	Product
Boliden AB:			
Aitik[2]	Gällivare	more than 3,000	Cu.
Laisvall	Laisvall	1,000-3,000	Pb and Zn.
Stokenjokk	Vilhelmina	500-1,000	Zn and Cu.
Vassbo	Idre	300-500	Pb.
Rävlidmyran	Kristineberg	do	Cu, Pb, Zn, S.
Langsele	Boliden	do	Cu, Zn, S.
Udden	Horsjö	do	Do.
Garpenberg	Garpenberg	150-300	Cu, Pb, Zn, talc.
Garpenberg Norra	do	do	Ag, Zn, Pb.
Renström	Renströmsgruvan	do	Cu, Pb, Zn.
Kristineberg	Kristineberg	do	Cu, Zn, S.
Näsliden	Mala	do	Cu and Zn.
Stora Kopparbergs Bergslags AB: Falun Kopparverk[3]	Falun	do	Cu, Pb, Zn, S.
AB Statsgruvor:			
Yxsjöberg	Hörken	do	W, Cu, CaF_2.
Stollberg	Smedjabaken	do	Pb, Zn, Fe.
Fagersta AB: Bäckegruvan	Riddarhyttan	do	Fe and Cu.
Soc. des Mines et Fonderies de Zinc de la Vieille-Montagne: Zinkgruvan.	AAmmeberg	300-500	Zn and Pb.

Iron Ore.—Swedish iron ore production decreased further under pressure from the steel slump and growing competition from new iron ore producing countries. Ownership of the iron ore mines of Gränges AB and Stora Kopparbergs Bergslags AB (SKB) was transferred at yearend to SSAB, the newly formed 50%-Government-owned steel company. Vintjärn (in central Sweden), SKB's only remaining iron ore mine, was shut down in 1977. The personnel of the Blötberget and Håksberg iron ore mines, also located in central Sweden, were informed by SSAB that operations will probably be suspended during 1979-80.

Government-owned LKAB's losses in 1977 were $145 million, owing to the steel slump and growing competition from other iron ore producing countries. The Government approved a $90 million investment program for the company in 1978, providing, among other benefits, temporary work for 850 of the 1,200 employees scheduled for discharge.

In Svappavaara, located in the Kiruna area, the concentrator and pellet plant were rebuilt in 1977, increasing pellet capacity from 2 million tons to 3 million tons per year. The mine closed in April, and the beneficiation plant was processing low-phosphorus iron ore from Kiruna.

Production was discontinued at the Ställberg and Stripa iron ore mines in central Sweden.

Iron and Steel.—During recent years, profits in Sweden's steel industry have been steadily declining, and this trend has accelerated efforts to improve the industry's structure in order to raise its productivity and increase its competitive ability both at home and in international markets. During 1977, two important official investigations—one dealing with commercial low-carbon steel and the other with specialty steels—resulted in proposals for achieving these goals.

In line with the proposed measures, the Swedish Government obtained Parliament's (Riksdag) approval in early 1978 of its bill on the formation of SSAB through the merger of Government-owned Norrbottens Järnverk AB (NJA) and the steel plants and related facilities of two large private companies (Gränges, which owns the Oxelösund facility, and SKB, which owns the Domnarvet steel plant at Borlänge). The merger also included acquisition by SSAB of several iron mines in central Sweden and the railroad (used largely for hauling ores to the port of Oxelösund) and harbor installations at Oxelösund, both owned by Gränges. The capital stock of SSAB is owned by the Government 50%, Gränges 25%, and SKB 25%.

The merger will probably result in the dismissal of 4,500 employees, out of a total of about 18,000. A special study group within SSAB is expected to present proposals in mid-1978 on how the operations of its three steel plants should be coordinated. On the

Digitized by Google

basis of this study, SSAB's Board of Directors will decide on the final structure of the new company, including necessary shutdowns and distribution of production schedules. The study group was considering six different options regarding the volume of crude steel production, ranging from 3.2 million tons to over 4 million tons annually. The study group is expected to propose the termination of crude steel production at the Domnarvet plant, involving closure of its metallurgical section. Completion of the entire restructuring program is expected to take several years. The new company is likely to face serious readjustment problems during the period of transformation, particularly among the personnel at the plant sites, because the company's management appears determined to restore the competitiveness of its commercial steel production at all costs, even if the program should call for a sharp reduction in its labor force.

The second official investigation recommended various measures designed to bring about a comprehensive structural rationalization of the specialty steels industry. The industry is currently in a precarious position; operating costs are abnormally high, losses are mounting, and profitability is declining. Overall operating losses have about doubled in 1977, and no perceptible improvement is envisaged in the immediate future.

Tungsten.—Statsgruvor was preparing to extract scheelite ore at Högfors, located between Grängesberg and Kopparberg in central Sweden. The company's concentrating plant at Yxsjöberg was rebuilt in 1977 for separate recovery of scheelite and copper concentrate from the ores produced at the company's nearby mine.

NONMETALS

Apatite.—In 1977, apatite production, chiefly by LKAB in conjunction with iron ore mining in the Kiirunavaara area, doubled that of 1976. The Swedish Government approved a $90 million investment program for 1978. A considerable share of these funds was allotted to construction of an apatite-processing plant at Kiirunavaara, using local iron ore pellet feed tailings as its raw material.

Cement.—In 1977, AB Cementa, owned 95% by Industri AB Euroc and 5% by LKAB, remained Sweden's only cement producer, controlling seven plants with a total capacity of 3.45 million tons per year. The cement plants were located at Rullhoegan (Jönköping County), Linhamn (Malmöhus County), Slite (Gotland County), Degerhamn (on Öland Island), Hällekis, Skövde (near Lake Vänern), and Stora Vika (Stockholm County).

Limestone.— SKB began to quarry limestone at Jutjärn, near Rättvik, just north of Lake Siljan in central Sweden. The company estimates that it can extract 26 million tons of prime limestone from this site, sufficient to maintain the present level of operations at the nearby Rättviks Kalkverk for 80 years.

SKB's mineral installations that will be transferred to SSAB include the limeworks of the Rättviks Kalkverk, Osmundsbergs Kalkbrott, and Dyrkatorps Dolomitbrott companies.

MINERAL FUELS

In 1977, Sweden derived about one-fifth of its domestic energy needs from hydroelectric power and fuelwood. The remainder was supplied by imported fossil fuels, mainly petroleum, and imported enriched uranium fuel. Supply and apparent consumption of fuels and power for 1976 and 1977 are shown in table 5.

Nuclear Power.—It was reported that Sydkraft AB's new 590-megawatt-electric reactor, Barsebeck-2, located near Malmö, became critical in February. By yearend, five nuclear powerplants were in operation with a total nominal capacity of 2,900 megawatts-electric.[4] Six more nuclear powerplants were under construction with design capacity totaling 5,240 megawatts-electic.

Petroleum and Natural Gas.—Plans were announced for construction of a gas pipeline extending from the Federal Republic of Germany through Denmark to Sweden. Sydgas, the Swedish company in charge of the project, values the pipeline at $500 million, including a distribution network for supplying southern Sweden with natural gas.[5]

Svenska Petroleum AB, a Government-owned oil-purchasing company, reached an agreement with the private Norwegian Oil Consortium (NOCO) guaranteeing Sweden some 6 million tons of crude during the 1980's in return for a loan of about $100 million, subject to approval of the Governments of both countries. NOCO has a 4% share in the Tor field and a 15% share in the Valhall field, with total estimated reserves of 58 million tons in both fields.

Table 5.—Sweden: Supply and apparent consumption of fuels and power for 1976 and 1977

(Million tons of standard coal equivalent[1])

	Total energy	Coal and coke	Petroleum and refinery products	Fuelwood black liquor, waste	Hydro-electric power[2]	Nuclear power[3]
1976:						
Production[4]	12.1	0.1	--	5.3	6.7	--
Imports	57.1	3.1	51.4	--	.8	1.8
Exports	4.7	--	4.1	--	.6	--
Apparent consumption	64.5	3.2	47.3	5.3	6.9	1.8
1977:						
Production[4]	12.0	--	--	5.5	6.5	--
Imports	53.9	2.2	48.8	--	.6	2.3
Exports	4.7	.1	3.9	--	.7	--
Apparent consumption	61.2	2.1	44.9	5.5	6.4	2.3

[1]1 ton standard coal equivalent (SCE)=7,000,000 kilocalories.
[2]Includes foreign trade of all electric power.
[3]Thermal burnoff of imported uranium fuel.
[4]Includes only primary energy.

Sources: Foreign Trade 1977, Monthly Bulletin. December 1978, p. 11.
Monthly Digest of Swedish Statistics. No. 3, 1978, p.22.

The oil and natural gas prospecting activities of the semi-Government-owned consortia Oljeprospectering AB (domestic) and Petroswede (foreign) continued. Financial frameworks reached between the participants were almost utilized in 1977, and new agreements were prepared for submission to the Parliament in 1978.

In 1977, Sweden's refining capacity (throughput) remained about 20.7 million tons per year, distributed as follows, in million tons per year:

Company	Ownership	Location of principal facilities	Approximate throughput
Scandinaviska Raffinaderi AB (Scanraff)	Government and Texaco Oil AB	Lysekil	8.3
BP Raffinaderi (Göteborg) AB	British Petroleum Co. Ltd	Göteborg	5.5
Koppartrans Olje AB	Shell Oil Co	do	5.0
AB Nynas-Petroleum	Rederi AB Nordstjernan	Nynashamn	1.4
		Göteborg	.3
		Malmö	.2

Uranium.—An LKAB application to mine 1.1 million tons of alum shale at Ranstad and extract from it as many components as possible (uranium, kerogen, heavy metals, etc.) was vetoed by local municipal authorities, and the veto was confirmed by the Swedish Government. A final Government decision on the matter is expected in 1978. AB Svensk Alunskifferutveckling, a corporation jointly owned by LKAB and Boliden, formed in the fall of 1977, is in charge of the alum shale project. The Ranstad uranium deposits are estimated to contain about 1 million tons of uranium in 14 billion tons of shale. This is equivalent to 80% to 85% of Europe's known uranium resources.[6]

The Mineral Industry of Switzerland

By Roman V. Sondermayer[1]

During 1977, Switzerland processed imported crude oil, alumina, and raw materials for iron and steel production and produced cement, lime, gypsum, salt, stone, and sand and gravel from domestic resources. Most energy requirements were met by imports of crude oil, natural gas, high-rank coals, and nuclear fuels. Hydroelectric power and nuclear power were the primary domestic sources of energy. The mineral industry of Switzerland, including processing, was significant only to the national economy; it contributed about 2% to the gross national product and employed approximately 1% of the total labor force.

During 1977, there was a change of ownership of the Bodio steelmaking facilities, and a new isomerization plant started up at the Cressier refinery.

PRODUCTION

The mineral industry was privately owned and had modern and efficient facilities. The following tabulation shows principal companies in operation in Switzerland during 1977.

Commodity	Major companies—principal facilities (Ownership)	Percent of output
Aluminum	Schweizerische Aluminium A.G.-ALUSUISSE - plants at Steg and Chippis.	80
Cement	Cement Werk Wuerenlingen - plant at Siggenthal.	36
Petroleum, refined	Raffinerie du Sud Ouest S.A. - refinery at Collombey (PB, ENI, Esso).	40
	Raffinerie de Cressier S.A. - refinery at Cressier (Shell, Gulf).	40
	Raffinerie Rheintal S.A. - refinery at Sennwald (ENI, Italy).	20
Steel, crude	Von Roll AG - plants at Gerlafingen and Bodio	75

TRADE

Swiss trade in minerals did not accurately reflect the activities of the country's minerals industry or the need for minerals. Most of the transactions recorded in nonfuels were of imports for reexport and were strictly commercial in nature. Tables 2-3 show details of Swiss foreign trade in minerals.

Switzerland had a negative trade balance in minerals with the United States. Imports from the United States were valued at $101.3 million with diamond and radioactive materials topping the list. Exports to the United States were valued at $31.5 million. Diamond, copper, and aluminum were, by value, the largest export items, as shown in table 4.

Table 2.—Switzerland: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Talc, steatite, soapstone, pyrophyllite	151	60	Austria 33; West Germany 8; Finland 2.
Other nonmetals, n.e.s.:			
Crude:			
Meerschaum, amber, jet kilograms	225	3	All to West Germany.
Other	1,336	15,444	West Germany 14,510.
Slag, dross and similar waste, not metal bearing:			
From iron and steel manufacture	5,569	7,179	West Germany 6,601; France 425; Italy 154.
Slag and ash, n.e.s.	119	162	Italy 156; France 5; West Germany 1.
Oxides and hydroxides of magnesium, strontium, barium	18	48	West Germany 23; Iran 16; Spain 5.
Bromine, iodine, fluorine	43	41	United Kingdom 37; Romania 2.
Building materials of asphalt, asbestos and fiber cement, unfired nonmetals, n.e.s.	2,853	2,566	France 906; Austria 578; West Germany 442.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	12	37	France 20; Trinidad 17.
Carbon black	16	82	U.S.S.R. 16; Czechoslovakia 9; France 8.
Coal, all grades including briquets	11,652	7	West Germany 5.
Coke and semicoke	13,349	589	All to West Germany.
Gas, hydrocarbon, manufactured	87	51	France 50.
Hydrogen, helium, and rare gases	25	147	Austria 97; West Germany 47.
Peat, including peat briquets and litter	1,472	1,178	Austria 825; France 352.
Petroleum refinery products:			
Gasoline, including natural thousand 42-gallon barrels	497	399	Mainly to Austria.
Distillate fuel oil do.	32	16	NA.
Residual fuel oil do.	341	167	All to Austria.
Lubricants do.	1	1	Mainly to Poland and Somalia.
Other:			
Liquefied petroleum gas do.	314	180	Italy 122; West Germany 32; Austria 25.
Petroleum coke do.	(1)	(1)	Mainly to West Germany.
Bitumen, other residues, bituminous mixtures, n.e.s. do.	4	6	West Germany 2; Austria 2; Egypt 1.
Unspecified do.	2	1	NA.
Total	1,191	770	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	467	836	West Germany 476; Sweden 104; Italy 42.

NA Not available.
[1]Less than 1/2 unit.

Table 3.—Switzerland: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite and concentrate	20,230	25,534	France 23,683; Italy 1,486.
Oxide and hydroxide	158,074	158,222	Australia 125,524; Guinea 17,323; Italy 5,476.
Metal including alloys:			
Unwrought	16,100	31,143	Iceland 11,552; Norway 11,064; Egypt 2,830.
Semimanufactures	16,435	24,235	NA.
Antimony metal including alloys, all forms	122	160	Belgium-Luxembourg 83; People's Republic of China 72; France 5.
Arsenic trioxide, pentoxide, acids	43	30	France 30.
Beryllium metal including alloys, all forms kilograms	788	1,388	United States 1,200; United Kingdom 15; West Germany 11.
Chromium:			
Chromite	4,232	NA	
Oxide and hydroxide	443	475	West Germany 323; Italy 40; United Kingdom 45.
Cobalt oxide and hydroxide	4	12	Belgium-Luxembourg 10; West Germany 1; Canada 1.
Columbium and tantalum metal including alloys, all forms, tantalum	1	1	NA.
Copper:			
Ore and concentrate	19	7	Australia 7.
Matte	33,890	21,303	West Germany 5,656; Belgium-Luxembourg 4,989; Austria 1,710.
Copper sulfate	547	745	France 304; U.S.S.R. 200; Czechoslovakia 120.

Table 3.—Switzerland: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Copper —Continued			
Metal including alloys:			
Scrap	4,170	1,945	West Germany 1,108; France 163; Austria 111.
Unwrought	1,239	1,629	West Germany 661; United Kingdom 246; Belgium-Luxembourg 219.
Semimanufactures	45,651	39,685	United Kingdom 16,156; West Germany 11,057; Belgium-Luxembourg 4,180.
Gold metal, unworked or partly worked thousand troy ounces	121	93	West Germany 49; United Kingdom 13; Denmark 9.
Iron and steel:			
Ore and concentrate, including roasted pyrite	44,640	31,835	Mauritania 27,688; Italy 2,350; Australia 1,072.
Metal:			
Scrap	96,803	43,793	West Germany 36,027; Austria 4,454; France 1,338.
Pig iron and similar materials	60,944	68,589	West Germany 37,743; France 7,923; Norway 6,745.
Ferroalloys	11,641	21,924	Norway 6,040; West Germany 2,942; France 2,881.
Steel, primary forms	95,683	93,785	West Germany 27,981; Japan 18,308; Hungary 16,045.
Semimanufactures:			
Bars, rods, angles, shapes, sections	291,258	351,069	West Germany 112,248; Italy 90,450; France 69,375.
Universals, plates and sheets	358,430	463,394	West Germany 112,914; France 68,293; Netherlands 46,580.
Hoop and strip	104,456	146,292	West Germany 53,361; Belgium-Luxembourg 32,030; France 20,008.
Rails and accessories	53,968	39,460	Austria 20,451; West Germany 11,301; France 2,212.
Wire	15,645	15,350	Austria 7,160; West Germany 4,728; Belgium-Luxembourg 1,710.
Tubes, pipes, fittings	75,878	105,609	West Germany 40,269; France 21,918; Austria 9,517.
Castings and forgings, rough	2,364	--	
Ingots and semimanufactures, alloy steel and high carbon	116,277	120,169	West Germany 48,601; France 16,180; United Kingdom 10,272.
Lead:			
Ore and concentrate	7	--	
Oxides	66	209	Mexico 150; United Kingdom 34; West Germany 8.
Metal including alloys:			
Scrap	62	48	France 44; West Germany 4.
Unwrought	14,355	14,748	France 3,923; United Kingdom 3,706; Canada 3,673.
Semimanufactures	1,243	1,205	West Germany 1,128; Belgium-Luxembourg 58.
Magnesium metal including alloys, all forms	1,286	1,501	Norway 1,170; Canada 125; U.S.S.R. 110.
Manganese oxides	472	579	Japan 287; Belgium-Luxembourg 167; West Germany 84.
Mercury 76-pound flasks	735	618	West Germany 331; U.S.S.R. 121; People's Republic of China 60.
Molybdenum metal including alloys, all forms	31	8	West Germany 5; Austria 2.
Nickel:			
Matte, speiss, similar materials	1,739	2,026	Canada 385; United Kingdom 359; Norway 325.
Metal including alloys:			
Scrap	160	295	Poland 222; West Germany 28; France 19.
Unwrought and semimanufactures	1,836	1,135	West Germany 202; United Kingdom 80; France 31.
Platinum group metals and silver including alloys:			
Platinum group thousand troy ounces	538	711	Netherlands 184; U.S.S.R. 145; West Germany 146.
Silver do	41,422	34,839	India 16,202; Mexico 4,749; United Kingdom 3,715.
Tantalum metal including alloys, all forms	1	1	Mainly from United States.
Tin:			
Ore and concentrate kilograms	--	--	
Oxides	8	6	United Kingdom 4; West Germany 2.
Metal including alloys:			
Scrap	9	24	West Germany 11; Italy 9; Sweden 5.
Unwrought	727	769	Indonesia 206; Thailand 171; Malaysia 156.
Semimanufactures	152	196	West Germany 136; France 23; United Kingdom 8.
Titanium oxides	6,258	6,754	France 2,033; West Germany 1,995; Netherlands 742.
Tungsten metal including alloys, all forms	57	23	West Germany 16; France 3; United Kingdom 2.
Uranium and thorium oxides, including rare earth oxides	12	12	France 7; Austria 2; West Germany 2.
Zinc:			
Ore and concentrate kilograms	18	50	NA.

See footnotes at end of table.

Table 3.—Switzerland: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Zinc —Continued			
Oxide	r1,840	2,322	France 936; West Germany 648; United Kingdom 350.
Metal including alloys:			
Scrap	40	14	Yugoslavia 14.
Blue powder	2,012	1,469	Belgium-Luxembourg 595; United Kingdom 312; France 171.
Unwrought	16,887	20,169	West Germany 6,511; Netherlands 3,119; Belgium-Luxembourg 1,990.
Semimanufactures	1,118	1,063	West Germany 416; Belgium-Luxembourg 402; Austria 75.
Other:			
Ore and concentrate, n.e.s	6,094	6,499	Republic of South Africa 2,893; Australia 2,190; Italy 925.
Ash and residue containing nonferrous metals	1,028	482	West Germany 339; France 110; Italy 20.
Oxides, hydroxides and peroxides of metals, n.e.s	2,252	1,374	West Germany 977; France 117; Belgium-Luxembourg 67.
Metals including alloys, all forms:			
Metalloids	2,894	2,631	West Germany 444; France 468; Italy 243.
Alkali, alkaline earth, rare earth metals	269	316	West Germany 271.
Pyrophoric alloys	13	3	Austria 1; West Germany 1.
Base metals including alloys, all forms, n.e.s	836	790	Republic of South Africa 325; West Germany 117; France 96.
Waste and sweepings of precious metals	206	347	West Germany 513; Netherlands 19; United Kingdom 4.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	1,020	809	West Germany 360; Italy 247; United States 143.
Dust and powder of precious and semiprecious stones ——— kilograms	1,202	1,614	Ireland 709; United Kingdom 573; West Germany 4.
Grinding and polishing wheels and stones	1,532	1,421	West Germany 645; Austria 176; Italy 166.
Asbestos	17,262	18,929	Canada 7,988; U.S.S.R. 6,227; Italy 1,973.
Barite and witherite	1,948	3,089	West Germany 2,522; France 487; Italy 80.
Boron materials:			
Crude natural borates	2,480	4,109	United States 3,891; West Germany 168; Netherlands 50.
Oxide and acid	572	630	France 438; Turkey 161; West Germany 11.
Cement	126,291	115,065	Italy 73,111; West Germany 20,267; France 17,490.
Chalk	16,447	20,397	France 16,498; West Germany 1,899; Italy 1,550.
Clays and clay products, including all refractory brick:			
Crude:	193,687	176,671	West Germany 61,737; United Kingdom 53,353; France 26,165.
Products:			
Refractory, including nonclay brick	29,109	26,030	West Germany 11,980; Austria 4,463; France 2,865.
Nonrefractory	160,987	172,138	Italy 91,237; West Germany 18,917; France 8,107.
Cryolite and chiolite	840	994	Denmark 994.
Diamond:			
Gem, not set or strung —— value, thousands	$113,759	NA	
Industrial ——— do	$2,495	NA	
Diatomite and other infusorial earth	3,231	4,539	Denmark 2,473; France 1,042; West Germany 294.
Feldspar and fluorspar	9,250	12,308	West Germany 4,207; Norway 3,506; Italy 2,693.
Fertilizer materials:			
Crude:			
Nitrogenous	162	103	NA.
Phosphatic	8,737	8,124	Morocco 6,043; United States 1,007; Netherlands 839.
Potassic	15,291	NA	
Manufactured:			
Nitrogenous	31,096	59,264	West Germany 23,961; Austria 14,683; Italy 9,895.
Phosphatic:			
Thomas (basic) slag	163,289	151,332	France 100,107; Belgium-Luxembourg 51,200.
Other	3,994	6,944	France 2,644; Belgium-Luxembourg 1,865; West Germany 602.

Table 3.—Switzerland: Imports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
NONMETALS —Continued			
Magnesite	3,793	3,486	Austria 3,259; France 87.
Mica:			
Crude, including splittings and waste	493	657	West Germany 425; Italy 47; France 35.
Worked, including agglomerated splittings	622	571	France 417; Belgium-Luxembourg 115; Austria 24.
Pigments, mineral:			
Natural, crude	340	413	Austria 119; United Kingdom 118; West Germany 111.
Iron oxides, processed	1,962	2,322	West Germany 2,278; United Kingdom 16; Italy 9.
Precious and semiprecious stone, except diamond:			
Natural thousand carats	217,700	NA	
Manufactured do	40,180	50,700	France 38,585; Austria 2,535.
Pyrite, gross weight	32,081	8,116	Mainly from Italy.
Salt and brines	2,143	1,737	France 1,496; West Germany 208.
Sodium and potassium compounds, n.e.s	8,826	10,591	Italy 3,797; France 3,016; West Germany 2,581.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	145,930	156,415	West Germany 112,885; Italy 18,057; France 14,794.
Worked	54,812	59,324	Italy 47,785; Austria 3,068; West Germany 1,826.
Dolomite, chiefly refractory grade	12,474	12,944	Italy 10,127; France 1,867; West Germany 585.
Gravel and crushed rock thousand tons	4,061	3,858	France 2,303; West Germany 673; Italy 647.
Limestone (except dimension)	7,027	7,293	France 7,187.
Quartz and quartzite	15,321	7,516	Italy 3,626; West Germany 3,516; France 158.
Sand, excluding metal bearing thousand tons	1,097	1,073	Italy 592; France 244; West Germany 173.
Sulfur:			
Elemental:			
Other than colloidal	27,816	33,676	West Germany 30,381; France 3,246; Belgium-Luxembourg 41.
Colloidal	261	251	West Germany 152; France 99.
Sulfur dioxide	29	38	Italy 35; France 2.
Sulfuric acid	1,843	2,093	France 920; west Germany 735; Italy 152.
Talc, steatite, soapstone, pyrophyllite	9,216	9,379	Austria 5,708; France 1,454; Norway 536.
Other nonmetals, n.e.s.:			
Crude:			
Meerschaum, amber, jet kilograms	2	25,000	West Germany 25,000.
Other	36,406	43,042	West Germany 21,868; France 6,914; Netherlands 6,703.
Slag, dross and similar waste, not metal bearing:			
From iron and steel manufacture	12,144	7,776	France 3,315; Italy 3,012; West Germany 1,315.
Slag and ash, n.e.s	15,563	19,593	West Germany 18,216; France 1,231; Italy 122.
Oxides and hydroxides of magnesium, strontium, barium	282	691	Netherlands 209; Spain 124; West Germany 87.
Bromine, iodine, fluorine	2,540	2,357	France 658; United States 615; Israel 570.
Building materials of asphalt, asbestos and fiber cement, unfired nonmetals n.e.s	20,610	22,321	West Germany 8,170; Austria 6,921; France 4,728.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	1,995	1,358	Trinidad 916; France 295; United States 125.
Carbon black and gas carbon:			
Carbon black	5,723	6,448	West Germany 2,567; France 1,744; Italy 1,531.
Gas carbon	25	15	NA.
Coal, all grades including briquets	180,165	166,423	West Germany 104,022; Poland 31,530; France 8,831.
Coke and semicoke	141,157	138,179	West Germany 103,677; France 22,881; Italy 4,027.
Gas, hydrocarbon, manufactured	1	(1)	
Hydrogen, helium, rare gases	1,351	1,838	West Germany 1,146; Italy 507; France 135.
Peat, including peat briquets and litter	60,789	67,295	West Germany 54,875; U.S.S.R. 8,597; Poland 2,677.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	32,750	30,039	United Arab Emirates 10,852; Nigeria 5,753; Iran 4,410.
Refinery products:			
Gasoline, including natural do	15,168	15,020	France 4,803; Italy 4,802; West Germany 1,971.
Distillate fuel oil do	5,822	9,396	Italy 1,795; France 1,104; West Germany 795.
Residual fuel oil do	33,065	37,210	France 11,214; U.S.S.R. 7,494; West Germany 5,193.
Lubricants do	4	6	West Germany 2; Belgium-Luxembourg 1; France 1.
Other:			
Liquefied petroleum gas do	6,014	6,300	Netherlands 5,841; West Germany 451.
Petroleum coke do	473	226	Italy 159; West Germany 55; United States 7.

COMMODITY REVIEW

METALS

Aluminum.—During 1977, three aluminum plants were in operation. Two plants, one at Chippis, Valais, and the other in Steg, Valais, were operated by Swiss Aluminium Ltd. (Alusuisse). The third plant, situated at Martigny, was owned by Usine d'Aluminium de Martigny S.A. Switzerland did not produce bauxite or alumina but imported alumina from Surinam, Guinea, and Australia to meet its demand.

Iron and Steel.—The Swiss iron and steel industry makes a much narrower range of products than the main producing countries in Europe. The range is completely dominated by production of reinforcing bars, which was affected by the downswing in the activities of the building sector during 1977.

During 1977, Monteforno Acciaierie e Laminatoi S.A. (Monteforno) was taken over by Von Roll AG, the largest steel producer in Switzerland, after an option to purchase was dropped by the Italian Romi ministeel group. Economic difficulties at Monteforno, which operated electric furnaces at Bodio, had resulted from an 8-month strike and the general slowdown of the economy. The purchase included all of Monteforno's holdings in subsidiaries, including a steel trading company.

In addition to the Bodio plant and Von Roll's Gerlafingen plant, two other plants at Lucerne (A.G. der von Moosschen Eisenwerke - Von Moos) and Wohlen (Ferrowohlen AG) were in operation. Approximate total annual capacity of all four plants was 700,000 tons.

Von Roll, dating back to the 18th century, is the largest steel company in Switzerland. At Bodio, acquired from Monteforno, the company operated three 80-ton electric furnaces and one 40-ton unit. An 80-ton Daniel continuous-billet caster, a blooming mill, and four billet mills were part of the operation. Electric power was supplied by two company-owned hydropower stations. At Gerlafingen, Von Roll operated two 45-ton electric-arc furnaces and two continuous-casting machines, giving a total capacity of 200,000 tons per year. Rolling mills, a 10,000-ton-per-year forging shop, and a number of foundries at different locations with a total output of 90,000 tons per year are part of the Von Roll operations. Von Roll was the country's only producer of pig iron in a 110-ton-per-day, low-shaft furnace, which was consumed in centrifugal casting of pipes.

The Von Moos steel mill is located beside the Emme River at Emmenbrucke, near Lucerne. Steel production at this site dates back to the mid-17th century, the present company was founded in 1842. The equipment consists of a 4-strand Concast, a 50 to 60-ton electric furnace, two smaller arc furnaces, and a 170,000-ton-per-year Schloemann mill.

At Wohlen, Ferrowohlen operates facilities, built in 1955, consisting of five electric-arc furnaces with a total annual capacity of 150,000 tons of steel, a continuous-casting machine of the same capacity, and two Banning bar mills with a capacity of about 130,000 tons per year of reinforced bars.

NONMETALS

Cement.—Cement remained the most important nonmetal produced in Switzerland during 1977. Fifteen cement plants, with an installed annual capacity of 6.2 million tons of cement, and four clinker grinding plants were in production. Of the total number of kilns, 18 were rotary dry type. Employment was about 1,600 persons. The largest cement producer remained Portland-Cement-Werk-Wuerenlingen-Siggenthal AG with its 1-million-ton-per-year plant at Siggenthal.

Other Nonmetals.—Switzerland produced salt, lime, gypsum, stone, and sand and gravel. Output of all nonmetals was of only domestic significance. Most of the salt was produced near Basel by a state monopoly and much of its output was consumed in Solvay's chemical works at Zurzach.

MINERAL FUELS

With no domestic production, imports of mineral fuels were essential to meet the energy demand of Switzerland. Domestic production of primary energy was limited to noncommercial fuels and hydroelectric power. Petroleum remained the principal source of energy in the country and accounted for 79% of the country's fuel consumption. Domestic hydropower and natural gas from abroad followed. Coal for coking and production of manufactured gas was imported since there was no production of coal.

Petroleum and Natural Gas.—During 1977, Switzerland did not produce crude petroleum or natural gas, and there was no drilling for hydrocarbons. Exploration was limited to geophysical activities mostly by Swisspetrol Holding AG (Swisspetrol), from Lake Geneva to Lake Constance aimed at the Molasse Formation of Miocene age. Swisspetrol completed half of its 7-year exploration program. Except for some show of hydrocarbons and general stratigraphic information, no discovery of commercial oil or gas was made.

The three refineries, with a capacity of 6.8 million tons, were in operation. At the Cressier refinery, a 420-ton-per-day isomerization plant, improving octane number of low-octane gasolines by 20 units, went onstream during the summer of 1977.

During 1977, Transigas AG was authorized, by pipeline authority, to double to 1,000 million cubic meters per year the volume of gas taken from the Netherlands-Italy pipeline for Swiss consumption.

Uranium.—As in 1976, three nuclear powerplants were operational, and four were in various stages of construction. When all are completed, installed capacity of nuclear powerplants in Switzerland should reach 4,500 Mwe.

The Mineral Industry of Taiwan

By E. Chin[1]

Taiwan's gross national product (GNP) for 1977 was estimated at $20.8 billion[2] at current prices and at $11.3 billion at 1971 prices, compared with $18.1 billion and $10.5 billion, respectively, for 1976.[3] The average annual growth rate in GNP during 1953-76 was 7.3% in absolute terms, and its growth in 1977 was 8.5% over that of the previous year. The net domestic product (NDP) in 1977 was $16.1 billion in current prices. By sector, the largest inputs to the NDP were manufacturing, 28.5%; agriculture, forestry, fishery, and livestock, 13.5%; Government services, 12.8%; commerce, 11.6%; real estate ownership, 6.6%; transportation and communications, 6.3%; construction, 5.9%; and banking, 5.2%. The mining sector accounted for only 1.0% of the NDP in 1977, compared with 1.5% in 1970, and according to the Directorate General of Budget, Accounting and Statistics of the Executive Yuan, the input of the mining sector was expected to be below 1% in 1978.

The index for agriculture production (1971=100) was 123.2 in 1977 compared with 117.7 in 1976. By commodity, the major growth areas were in the value of fruits and vegetables, livestock, and fishery products. Owing to strong export demand for domestically produced goods, Taiwan's industrial production index increased 12% in 1977. Manufacturing (the largest component of the index), construction, and public utilities were the major sectors showing vigorous growth. The indices of industrial production (1972-77) for mineral-related components of the economy are given in the following tabulation:

Industrial sector	1972	1973	1974	1975	1976	1977
Mining:						
Coal	97.7	83.1	73.3	78.4	80.8	73.8
Metals	138.9	152.8	195.5	192.4	263.7	255.0
Nonmetals	114.1	131.6	128.7	155.4	260.8	333.8
Salt evaporation	64.7	56.9	54.0	39.8	71.6	73.6
Chemicals and petroleum refinery:						
Acids and alkalis	104.1	109.9	112.3	94.2	101.8	109.1
Fertilizers	110.2	122.6	144.3	115.2	161.4	167.5
Petroleum refining	124.2	149.7	126.0	137.0	189.5	212.8
Miscellaneous petroleum products	123.2	152.0	158.0	223.8	406.6	503.8
Coke	98.0	85.8	73.7	79.3	89.9	90.1
Nonmetallic mineral products:						
Structural clay products	101.5	108.6	100.9	101.8	117.3	127.5
Cement	111.1	115.4	116.9	128.7	165.7	195.4
Cement products	114.9	117.4	111.5	121.0	88.2	78.0
Metal products:						
Basic metals	112.6	132.6	130.5	112.9	147.9	172.5
Nonferrous metals	123.2	135.4	115.9	111.4	107.5	121.8

Taiwan has small coal mines, small- to medium-size quarries, and medium- to large-size industrial plants. Taiwan is deficient in minerals, except construction raw materials. Ranked by value, fuels (primarily coal and some crude petroleum and natural gas), dolomite, lime, and limestone (including marble) were the leading mineral

Digitized by Google

products mined in Taiwan. However, output of each of these minerals was not significant in terms of the world market. Other economically important minerals mined domestically included copper, gold, salt, sulfur, and talc. However, the value of Taiwan's processing activities of imported minerals and metals continued to overshadow the value of indigenous extraction. In 1977, the mineral-processing sector outweighed the domestic mining sector 22 to 1 in output value, compared with a 16:1 ratio in 1976. A breakdown by value of output for mineral-related sectors, in million dollars, follows:

Industrial sector	1976	1977
Mining:		
Crude oil and natural gas	116	124
Coal	115	112
Metals	27	25
Evaporated salt	7	7
Miscellaneous nonmetals	32	41
Manufacturing:		
Chemical products	2,563	3,233
Oil and coal products	1,462	1,841
Basic metals	614	782
Nonmetallic mineral products	535	666
Metal products	175	225
Total	5,646	7,056

The average number of persons employed monthly by the mining and quarrying sector in 1977 was 44,546, compared with 1,270,781 in manufacturing, 286,415 in transportation and communications, 202,051 in construction, and 145,781 in services. The average number of working days per month for employees in mining and quarrying (22.4) was lower than that of the other major industrial sectors which ranged between 23.7 and 27.6 days. Employees of the electricity, gas, and water utilities had the highest average monthly earnings ($231), followed by transportation and communications ($177), construction ($164), manufacturing ($152), mining and quarrying ($135), and services ($111).

During 1968-77, Taiwan's total supply of energy increased 10.96% annually, with the largest growth resulting from imports of coal (34.98%), crude oil (18.48%), and petroleum products (15.5%). In 1977, the island's total supply of energy was estimated at 25 million kiloliters, expressed in oil equivalent. Domestic production of fuels accounted for 22% of the total, which by commodity was as follows: Coal 39%, natural gas 36%, hydroelectric power 20%, and crude oil 5%. Imports provided 78% of the total energy supply, distributed as follows: Crude oil 79%, petroleum products 20% and coal 1%. The demand for commercial energy was as follows, in million kiloliters of oil equivalent: Hydroelectric power, 1.1; thermal electric power, 7.2; coal and coal products, 1.9; petroleum products, 11.2; natural gas, 1.5; nuclear power, 0.04; exports, 1.6; and inventory adjustment, 0.4.

Taiwan's industrial consumption of energy increased 11% in 1977. The estimated breakdown of consumption, expressed in electric energy equivalent and detailed by the mineral-related industries, was as follows, in million kilowatt-hours:

Sector	1973	1974	1975	1976	1977
Mining and quarrying	311	317	339	364	381
Basic industrial chemicals	1,050	1,132	1,172	1,236	1,222
Chemical fertilizers	536	536	480	472	529
Other chemical products	1,546	1,645	2,084	2,519	2,894
Cement	763	761	885	1,127	1,311
Iron and steel	1,302	1,387	1,560	1,726	1,966
Aluminum	181	352	231	334	517
Metal products	324	325	443	523	591
Other industries	7,553	7,290	8,609	10,057	10,999
Total	13,566	13,745	15,803	18,358	20,410

In the early 1970's, the Government initiated the Ten Major Construction Projects designed to place Taiwan in the ranks of the developed countries by the end of the decade. By the end of 1977, construction on the 10 infrastructure projects was well underway, and most of them were due to be completed in 1979. The Government subsequently proposed 12 additional projects, almost all of which are a continuation of the 10 original projects. They include further expansion of railroads, highways, steel mills, harbors, nuclear powerplants, and agricultural mechanization. Additionally, Government-owned enterprises such as the Chinese Petroleum Corp. (CPC), Tang Eng

Digitized by Google

Iron Works, and Taiwan Machinery Manufacturing Co. were to invest substantially in large-scale manufacturing facilities for heavy industry projects.

Through its contribution to exports, foreign investment continued to play an important role in Taiwan's economy, inasmuch as 28% of exports came from foreign-owned plants and factories, which generally provided more sophisticated technology and management. Foreign investment approvals in 1977 totaled $164 million compared with $142 million in 1976. Because of low labor costs and high productivity, a stable economy, and attractive investment incentives, Government approvals in 1978 were expected to reach $180 million. Since 1973, the Government has shifted its foreign investment recruitment policy toward attracting capital-intensive industries. Paralleling the increase in foreign investments, domestic private investments recovered from the depressed levels that followed the 1974-75 recession during which plant capacity utilization was sharply reduced. Growth in imports, improvements in product quality, and mechanization of labor-intensive processes are credited for the recent rise in domestic investment.

PRODUCTION

Coal was the most important mineral commodity mined in Taiwan. However, output of bituminous coal in 1977 decreased 9% to 2.9 million tons, valued at $112 million. Although crude petroleum production increased 3% over that of 1976, the principal significance of indigenous oil was as a very small supplement to imported crude oil in the production of refinery products. Natural gas output also increased 3% in 1977, but it was of little consequence by world standards.

The overall value of production by the mining industry was estimated at $310 million[4] which was distributed as follows, in million dollars: Crude petroleum and natural gas, 124; coal, 112; metals, 25; evaporated salt, 7; and miscellaneous nonmetallic mining and quarrying, 42. By comparison, the output value added by secondary and tertiary mineral-related industries was as follows, in million dollars: Chemicals and chemical products, 3,233; petroleum and coal products, 1,841; basic metals and metal products, 1,006; and nonmetallic mineral products, 666.

Other than coal, the only minerals domestically mined in significant quantities included salt, dolomite, lime and limestone, marble, clays, and soapstone.[5] Small amounts of metals were produced domestically (notably copper, iron, gold, and silver). In addition to byproduct sulfur, domestic production of other nonmetals included gypsum, serpentine, asbestos, talc, feldspar, mica, and sand.

The bulk of Taiwan's industrial output of mineral-derived products is from imported materials. Domestic production of finished articles and semimanufactures are distributed for export markets as well as internal consumption. Metal production includes ingot and manufactures of iron and steel, aluminum, copper, gold, and silver. In addition, there is significant output of derivative materials from nonmetals and petroleum refining, including mineral acids and alkalies, chemical fertilizers, chemicals, and pharmaceuticals, organic solvents and fuels, refractory brick, and cement. In 1977, the output value of the mineral-processing sector was estimated at $6.7 billion.

TRADE

Taiwan's two-way trade in 1977 totaled $17,872 million, up 13% from that of 1976. Exports increased from $8,166 million in 1976 to $9,361 million in 1977. Similarly, imports increased from $7,599 million to $8,511 million. The largest import categories during 1977 were as follows, in million dollars: Basic metals and metal products, 3,465 (includes iron and steel, 596, and nonferrous metals, 292); nonmetallic minerals, 1,495 (includes crude petroleum, 1,320); agricultural, forest, and food products, 1,484; chemical and pharmaceutical products, 1,083 (includes chemical compounds, 461, and chemical fertilizers, 20); textiles and related products, 643; and nonmetallic mineral products, 343 (includes refined petroleum products, 288).

Textile, leather, wood, and related products, valued at $3,477 million, constituted 37% of total exports. Exports of basic metals and metal products were valued at $3,465 million, the majority of which was electrical machinery and apparatus valued at $1,568 million. In this category, exports of iron and steel and nonferrous metals were valued at only $115,000 and $20,995, respectively, illustrating Taiwan's ability to export value-added manufactures. The other leading export categories included agricultural and food products, $1,237 million; nonmetallic mineral products, $355 million (includes refined petroleum products, $183 million; cement, $44 million; and glass and glass products, $43 million); and chemical and pharmaceutical products, $218 million. Exports of nonmetallic minerals were valued at only $4 million during 1977.

Taiwan's major export destinations were the United States (39%), Japan (12%), Hong Kong (7%), and the Federal Republic of Germany (5%). Exports to Malaysia and Singapore, the United Kingdom, Canada, Saudi Arabia, and Australia each ranged from 2% to 3%.

By value, imports from Japan accounted for 31% of Taiwan's total imports, followed by the United States 23%, Kuwait 8%, Saudi Arabia 6%, and the Federal Republic of Germany 3%. Imports from Hong Kong, Malaysia and Singapore, Australia, and the United Kingdom were each around 2% of total imports.

Taiwan is dependent on imported raw materials, which account for close to 80% of total imports, to meet the demands of its export-oriented industries. Petroleum is the single largest import item. By value, about 50% of the country's foreign trade is with Japan and the United States. To counterbalance the adverse effects of currency revaluations, higher fuel costs, and other factors on the economy, Taiwan was attempting to diversify export markets and overseas supply sources. Part of this promotion program included sponsoring exhibitions of domestically produced goods and manufactures in new markets and upgrading the quality of existing product lines. Publicly funded institutes were established in the textile, electronics, and metalworking fields to aid producers in improving product quality. The Government was planning to abolish geographic restrictions on imports of more than 1,000 items in a move to reduce inflationary pressures on the economy owing to higher import prices. Also, an export-import bank was scheduled to begin operations in 1979 to assist domestic industries with export financing.

Table 2.—Taiwan: Exports and reexports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Oxide and hydroxide	975	230	Philippines 110; Japan 100; Republic of Korea 20.
Metal including alloys, all forms	5,174	3,963	Hong Kong 1,284; Japan 1,112; Saudi Arabia 245.
Beryllium metal, waste and scrap	353	358	All to Japan.
Copper:			
Ore and concentrate	792	264	Do.
Copper sulfate	60	4	NA.
Metal including alloys:			
Scrap	400	443	NA.
Unwrought	1,673	5,267	Mainly to Japan.
Semimanufactures	4,702	3,877	Japan 1,895; Hong Kong 1,320.
Iron and steel metal:			
Scrap	32,348	98,898	Japan 43,711; Hong Kong 28,411; Thailand 12,804.
Pig iron, ferroalloys, similar materials	53,883	43,129	Japan 26,950; Thailand 3,951; Singapore 2,257.
Steel, primary forms	5,658	894	NA.
Semimanufactures:			
Bars, rods, angles, shapes, sections:			
Wire rod, other bars and rods	106,074	102,122	NA.
Angles, shapes, sections	21,883	33,380	Mainly to Indonesia and Saudi Arabia.
Universals, plates, sheets	23,676	15,722	NA.
Hoop and strip	13,419	11,199	Mainly to Indonesia and Saudi Arabia.
Rails and accessories	255	9,203	Singapore 8,625; Thailand 280; Colombia 150.
Wire	8,863	5,725	Mainly to Saudi Arabia.
Tubes, pipes, fittings	64,312	101,385	United States 51,047; Saudi Arabia 13,656.
Castings and forgings, rough	5,316	7,274	NA.
Lead metal including alloys, all forms	932	1,380	Japan 850; Singapore 223; Saudi Arabia 70.
Magnesium metal including alloys, all forms	247	243	United States 223; Japan 20.
Manganese oxide	1	--	
Mercury 76-pound flasks	17	23	All to Thailand.
Nickel:			
Matte, speiss, similar materials	61	275	Mainly to Japan.
Metal including alloys:			
Scrap	202	643	Do.
Unwrought and semimanufactures	56	41	Japan 28; Jordan 12.
Platinum-group metals and silver:			
Waste and sweepings:			
Silver troy ounces	2,347	--	
Other do	579	111,562	NA.
Metals including alloys:			
Platinum-group do	3,247	482	All to United States.
Silver do	155,545	18,455	Saudi Arabia 11,381; United States 4,758.
Tin metal including alloys, all forms	60	146	Singapore 64; Hong Kong 56; Philippines 16.
Tungsten (wolfram) metal including alloys, all forms	5	3	West Germany 1; Hong Kong 1.
Zinc:			
Oxide and peroxide	847	1,004	Japan 798; Philippines 150.
Metal including alloys, all forms	43	72	Philippines 28; Saudi Arabia 14; Japan 12.
Other:			
Ash and residue containing nonferrous metals	61	102	All to Japan.
Oxides, hydroxides, and peroxide of metals, n.e.s.	10	30	All to Indonesia.
Metals including alloys, all forms:			
Metalloids: Silicon	184	157	NA.
Alkali, alkaline-earth, rare-earth metals	1	10	All to Hong Kong.
Pyrophoric alloys	15	10	West Germany 6; Hong Kong 3.
Base metals including alloys, all forms, n.e.s.	10	484	Singapore 450; Japan 19; Indonesia 10.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	9	33	Philippines 20; Thailand 8.
Dust and powder of precious and semiprecious stones kilograms	--	230	Singapore 101; Trinidad and Tobago 99; United States 30.
Grinding and polishing wheels and stones	778	1,205	Philippines 192; Australia 191; Thailand 172.
Asbestos	8	11	Mainly to Japan.
Barite and witherite	3	21	Mainly to Indonesia.
Boric oxide, acid, borates, perborates	37	72	Mainly to West Germany.

COMMODITY REVIEW

METALS

Aluminum.—Taiwan Aluminum Corp. (Talco) was the country's sole producer of aluminum. Talco was 100% Government owned and was integrated from alumina production through the metal-semifabricating stage. On July 25, typhoon Thelma hit southern Taiwan, inflicting substantial damage to Kaohsiung. Smelter No. 1, with an annual capacity of 38,000 tons, was severely damaged, and about 150 pots were either totally or partially decommissioned by the typhoon. By September, some 30 of the pots had been repaired and 56 more were to be online in October. Repair of 60 pots that were the most seriously damaged was to be completed by yearend.

Construction of Talco's Smelter No. 1 (annual capacity of 37,000 tons) was completed in 1976, but its commissioning was delayed. When the typhoon struck, the 60 pots in operation were shut down but were reactivated in August. The 40 that were to be brought onstream in August were scheduled for startup in October.

Alumina production in 1977 was 51,074 tons, and ingot production totaled 29,740 tons. Manufacture of aluminum sheet was 20,295 tons; foil, 2,740 tons; and miscellaneous aluminum products, 37,744 tons. The aluminum industry consumed 516.9 million kilowatt-hours of electricity in 1977 compared with 333.5 million kilowatt-hours in 1976.

Taiwan imports bauxite as the primary raw material for its aluminum industry. During prospecting for geothermal development, the Mining Research Service Organization discovered a low-grade bauxite occurrence in a 300-square-kilometer area between Tamsui and Yehliu in northern Taiwan. Ore tonnage was estimated to be in the hundred millions, averaging about 30% Al_2O_3.

Copper.—Taiwan Metal Mining Corp. (TMMC), a Government-owned company, controlled most of the copper industry in Taiwan. TMMC operates the only copper mine in Taiwan, which is located at Chinkuashih and produces around 2,000 tons (metal content) of copper annually. Copper concentrate is imported to food the 10,000-ton-per-year smelter near the mine. Metal output during the year was 11,500 tons. Lurgi Chemie was awarded contracts for construction of a 50,000-ton-per-year smelter at Taichung. Estimated cost of the project was $50 million, with completion scheduled for 1979.

Iron and Steel.—Taiwan's small magnetite placer operations are located along the northern coast between Tanshui and Wandi. Mine production was only 32,400 tons, and most of Taiwan's requirements for iron ore and concentrate were met by large tonnage imports from India and Australia to feed its Government-owned integrated steel mill. The industry's demand for other ferrous metals is met by imports of iron and steel scrap metal and by imports of old ships and vessels for scrapping.

China Steel Corp. (CSC), a State enterprise, completed the first-stage construction of its integrated steelworks at Kaohsiung on December 16. Construction was to begin on the second-stage facilities in May 1978 to increase annual output capacity from 1.5 million tons to 3.25 million tons of steel. Second-stage construction, costing $1.34 billion, was scheduled for completion in mid-1982, with financing provided equally by the Government and banking institutions.

Presently, CSC produces steel plate, rebar, wire rods, pig iron, and billet. Upon completion of the second stage, CSC's products will include hot-rolled strips and sheets, cold-rolled sheet, and base plate. A third-stage expansion was planned to increase annual capacity to 4.75 million tons, considerably below the originally planned target of 6 million tons per year.

The Government was planning measures to assist private producers of iron and steel products by providing the small producers with aid in renovating equipment, upgrading product quality, lowering costs, and expanding overseas sales. In principle, these Government-approved measures included insuring that CSC supplies high-quality pig iron at reasonable prices to small domestic users, assisting small foundries and steel mills to merge, providing technical guidance for iron smelters, and prohibiting the establishment of new private iron and steel works.

In addition to CSC, there were 34 small pig iron producers in Taiwan, 80% of them in the northern part of the island. Pig iron production during the year totaled 72,425 tons; ferrosilicon, 25,621 tons; and steel ingot, 644,000 tons. Semimanufactures of

Digitized by Google

iron and steel in 1977 were as follows, in thousand tons: Cast iron pipe, 82; iron wire, 54; galvanized wire, 43; tin plate, 69; galvanized sheet, 36; steel rod and bar, 1,001; steel sections, 478; steel tubes and pipes, 165; steel ball, 1; and steel cable, 15. Power consumption by the iron and steel industry in 1977 was estimated at 1,966 million kilowatt-hours.

Taiwan Machinery was planning an expansion of its electrolytic tin plate facility at Kaohsiung. The project would increase its annual production capacity of tin plate from 30,000 tons to 100,000 tons. The company has a technical cooperation agreement with Aetna Standard Engineering Co. of Pittsburgh, Pa., to produce tin plate.

Tang Eng completed construction of a $39.5 million alloy steel plant in Kaohsiung. The new plant was designed to produce 75,000 tons of alloy steel per year including carbon steel, chrome steel, nickel-chrome steel, stainless steels, tool steel, spring and shaft steels, and other alloys. Facilities at the plant include a rolling mill, steelmaking shop, heat treatment shop, machine shop, forging shop, and cold finishing works. The plant was being operated under a technical cooperation agreement with Krupp Co. of the Federal Republic of Germany.

Other.—Gold was produced from vein deposits at the Chinkuashih mine. No placer deposits were being worked in Taiwan. In 1977, domestic production of gold and silver decreased 44% and 32%, respectively. Taiwan does not produce any primary zinc, lead, tin, or nickel, but consumes sizable tonnages of these metals annually. Industrial demand for these metals are met by imports primarily from Australia, Canada, Japan, Malaysia, and the United States.

NONMETALS

Cement.—Cement production totaled 10.3 million tons, 1.57 million tons more than that of 1976. Exports of cement increased sharply, reaching 1.56 million tons in 1977 compared with 543,251 tons in 1976. The principal export destinations were Hong Kong, Singapore, and Saudi Arabia. Domestic demand for cement continued to increase owing to consumption resulting from construction in connection with Taiwan's Ten Major Construction Projects, new Government projects, and increased export shipments.

There were 14 operating cement plants in Taiwan (6 in the south, 6 in the north, and 2 in the east) with a total annual production capacity of nearly 11 million tons. Most of the plants had their own limestone quarries, and only a few small plants purchased limestone raw materials from quarries operated by others. The eastern coast of the island was becoming the cement export center because of rich natural resources and Government directives aimed at accelerating the growth of eastern Taiwan. Also, the completion of the Suao-Hualien railroad provided a direct link for cement plants to Hualien Harbor.

Taiwan Cement Corp. (TCC) was the largest cement producer on the island with plants at Kaohsiung, Chutung, Suao, and Hualien, with a combined annual capacity of 3.8 million tons. Asia Cement Corp., with a 2.5-million-ton-per-year plant at Tahu near Hsinchu, ranked next to TCC. The remaining cement capacity, 4.7 million tons, was distributed among nine plants of eight companies. Energy consumption by the cement industry was estimated at 1,311 million kilowatt-hours.

Expansion and modernization programs underway or planned included a 1,000-ton-per-day expansion of Chien Tai Cement Co. Ltd., a 3,000-ton-per-day expansion of the Kangshan plant of Chia-Hsin Cement Corp., the purchase of major equipment for the new 2,200-ton-per-day plant of Hsin Hsin Cement Corp., expansion of the Hualien plant of Asia Cement from 2,200 tons to 5,200 tons per day, and a 3,200-ton-per-day expansion of the Suao plant of TCC.[6]

Fertilizer Materials.—In 1977, Taiwan produced 602,176 tons of ammonium sulfate, 395,967 tons of anhydrous ammonia, 271,407 tons of compound fertilizers, 190,206 tons of calcium superphhosphate, 204,966 tons of urea, and 18,113 tons of Nitrochalk. Taiwan has no potash resources and only small apatite resources. During 1977, Taiwan imported 314,950 tons of natural phosphates and 285,429 tons of chemical fertilizers to meet domestic demand for fertilizer materials. Energy consumption by the chemical fertilizer industry totaled 520.5 million kilowatt-hours of electricity.

Salt.—All salt production was by Taiwan Salt Works, a Government monopoly. The saltfields are distributed along the southwestern coast, and crude salt was produced by solar evaporation. In 1977, salt production totaled 496,058 tons, about the 1976 level of output. Imports of salt were over 1 million tons. The largest consumer of salt was the soda-chlorine industry, which produced 86,060 tons of caustic soda, 285,374

Digitized by Google

tons of liquid soda, 74,625 tons of soda ash, and 30,691 tons of liquid chlorine.

Stone.—Dolomite deposits are extensive and widespread, particularly in eastern Taiwan. The most important dolomite quarries were situated along the Techoshuichi stream, north of Hualien, with lesser quarries operating near Hoping, Hojen, and Chungte. Total production of dolomite in 1977 was 274,000 tons, compared with 172,421 tons in 1976. Most of the dolomite was used by ironworks, glass manufactures, and chemical plants.

Commercial limestone deposits occur in many parts of Taiwan, and large quarries were being worked, particularly in the southwest and east. Limestone reserves were estimated at more than 450 billion tons. Production in 1977 totaled 11,679,360 tons, a 22% increase over output in 1976. The cement industry continued to be one of the largest consumers of limestone. Considerable quantities were also used for sugar refining. Burned or calcined limestone went into lime manufacture, and high-purity raw limestone was the chief raw material for making carbide cyanamide.

The crystalline limestone in the metamorphic terrain of eastern Taiwan is classified as commercial marble. Production of marble increased 33% to 4,379,385 tons in 1977. Most marble consumption was by the cement and fertilizer industries. The percentage of the total output of marble used as building stone was small, but it was increasing. Output of decorative marble in 1977 was 1.6 million cubic meters, compared with 1.2 million cubic meters in 1976 and 0.5 million cubic meters in 1975.

Other.—Sulfur production was mainly from the Kaohsiung refinery of Chinese Petroleum Corp. and from pyrite recovery from copper mining. Sulfur recovery during the year was about 7,778 tons. Taiwan produces small quantities of asbestos and gypsum from schistose rocks in the eastern part of the island. Production of other nonmetals included low-grade clay, gem stones, mica, glass sand, serpentine, and talc.

MINERAL FUELS[7]

Coal.—Coal, the most important mineral commodity mined in Taiwan, occurs mainly in northern Taiwan. The coalfields are geologically complicated, having abundant faults and folds. Generally, coal production has decreased annually since the 1960's. Output in 1977 was 2,955,915 tons compared with 3,235,810 tons in 1976. Mine production was as follows, in thousand tons:

District	Number of mines	Production
Taipei Hsien	85	1,728
Taoyüan Hsien	10	95
Hsinchu Hsien	24	155
Miaoli Hsien	27	310
Chiayi Hsien	1	--
Taipei City	18	215
Keelung City and other	23	453
Total	188	2,956

By volume, 92 mines produced less than 500 tons per month, 22 mines between 500 and 1,000 tons per month, 54 between 1,000 and 2,000 tons per month, 10 mines between 3,000 and 5,000 tons per month, and 10 mines above 5,000 tons per month. Under the current economic plan, the target output for coal in 1977 was 3.3 million tons, decreasing to 3.1 million tons in 1978. Sales of coal to major end users in 1977 were as follows, in thousand tons:

End User	Source	
	Domestic	Imported
Government enterprises:		
Taiwan Power Co	551	19
China Steel Corp	--	637
Taiwan Railroad Co	106	--
Taiwan Sugar Corp	29	--
Other	89	--
Private enterprises:		
Taiwan Cement Corp	105	--
Chia-Hsin Cement Corp	89	23
Asia Cement Corp	66	--
Global Cement Corp	64	15
Other cement plants	180	--
Other	1,672	24

About 20% of the coal produced in Taiwan was classified as coking coal. Pioneer Chemical Corp. and Hsin-Chu Chemical Corp. operated the only byproduct coke plants in Taiwan; both also produced coal gas for municipal use. Total production of coking coal in 1977 was 229,000 tons including 153,000 tons of metallurgical coke and 26,000 tons of foundry coke. The principal domestic user industries were iron and steel works and carbide and plastic manufacturers.

Natural Gas.—The Government's production targets for natural gas in 1977 and 1978 were 1,902 million and 2,145 million cubic meters, respectively. Actual output in 1977, however, totaled 1,886 million cubic meters. Production was largely from 20 producing wells in the Chinshui gasfield and from 29 producing wells in the Tiehchenshan gas-

Digitized by Google

field. Taiwan's natural gas reserves were estimated at 29 billion cubic meters. While annual production is small by world standards, the island's output and reserves of natural gas were considered an important energy supplement sufficient to meet the current consumption level of natural gas.

Petroleum.—Production of crude oil in 1977 was 253,928 kiloliters (about 216,000 tons), a 3% increase over that of 1976. Domestic production equaled less than 2% of crude oil imports in 1977. During the year, Taiwan imported 13,569,000 tons of crude oil valued at $1,251 million and 3,316,926 tons of refined petroleum products valued at $273 million.

CPC produces, imports, refines, and markets all petroleum, natural gas, and their products used in Taiwan. CPC owns seven 100,000-ton tankers and one 36,000 ton ship, which collectively are capable of handling 70% of the crude oil Taiwan imports to meet its needs. In addition, CPC maintains loading and storage facilities for the imported oil; its storage field contains six tanks capable of holding 450,000 tons of crude oil.

CPC has two refineries in operation at Kaohsiung; one has a capacity of 334,500 barrels per day, and the other, which came onstream in 1977, has a capacity of 100,000 barrels per day. Construction of a new refinery at Taoyüan, with a capacity of 100,000 barrels per day, was scheduled for completion late in the year. Additionally, CPC operates two petrochemical complexes —One at Kaohsiung (the largest), which utilizes petroleum as its raw material, and the other at Toufen in the north, which uses natural gas. Kaohsiung has three naphtha crackers—one with an annual capacity of 54,000 tons of ethylene and two with annual capacities of 230,000 tons of ethylene. CPC also has invested in downstream plants, including China Petrochemical Development Corp., Chung-Tai Chemical Industries Corp., Taiwan Alkali Co., Taiwan Polypropylene Co., and China American Petrochemical Co. Principal products produced in 1977 were as follows, in kiloliters: Fuel oil, 7,722,557; diesel oil, 2,585,508; gasoline, 1,554,575; lubricating oil, 120,801; and kerosine, 50,906.

The Mineral Industry of Tanzania

By David E. Morse[1]

Mineral production in Tanzania remained modest by world standards in 1977. Diamond, salt, and other gem stones were the only commodities exported in significant quantities. The State Mining Corp. through subsidiaries controlled the nation's mining operations, conducted mineral exploration, and, in cooperation with teams from several foreign countries, assessed beach sand deposits along the southern coast, kaolin resources at Pugu Hill, coal deposits near Mbeya, and iron ore deposits in the Chunya region. The mineral resources of Tanzania have not been fully evaluated since the country has been only 60% surveyed geologically and 20% prospected.

The third 5-year development plan, which began in July 1977, projected a 6% annual increase in the gross domestic product (GDP). The emphasis of the plan was the development and processing of domestic raw materials to supply local industry. Development of an iron and steel industry in the Mbeya region and expanded cement production were among the major projects of the plan. Planned growth in the mining sector was to be 9.3% per year during the 5-year period.

In February, Tanzania officially closed the border between Tanzania and Kenya. This action significantly affected many domestic firms that relied on Kenya as a supplier of raw materials, spare parts, and consumer goods. It also signaled the end of the East African Community (EAC), a commercial and shared-service pact among Tanzania, Kenya, and Uganda. Tanzania created new organizations in 1977 to replace the airline, rail, and harbor corporations that had been managed by EAC.

PRODUCTION

Diamond retained its position as the most important mineral product in terms of value in 1977 although output declined 7%. Petroleum refinery throughput and solar-evaporated salt production also declined during 1977. Gold production increased significantly owing to the start of trial milling of ore from the Lupa goldfield. Cement production from the Wazo Hill plant increased 7.8% over that of 1976. Production of gem stones other than diamond continued on a small scale from mines in the Merelaui area in northern Tanzania.

TRADE

Diamond, salt, and other gem stones were the major mineral exports of Tanzania in 1977. Diamond exports declined 39% in quantity but only 29% in value owing to an increase in the world market price. Exports of residual fuel oil from the Dar es Salaam refinery were valued at $8.6 million.

During 1977, imports were restrained by the Government as they had been in 1975 and 1976. The balance-of-trade deficit in 1977 was approximately $103 million compared with $72 million in 1976 and $296 million in 1975. The balance-of-payments picture brightened; the deficit was $11 million in 1977 compared with $45 million in 1976 and $229 million in 1975. Imports of fuel and lubricants, valued at approximately $106 million, continued to be a burden on the economy despite a 30% decrease in the volume of imported crude oil.

COMMODITY REVIEW

METALS

Gold.—Small scale production of gold has continued in Tanzania since 1970 when the last major gold mine was closed for lack of ore. Development work and trial milling at the Lupa goldfield produced an estimated 5,466 troy ounces in 1977. The Lupa operation was to be commissioned in 1979 and will produce about 9,600 troy ounces of gold per year. Work on development of the Buck Reef project in the Rwamagaza area of the Geita District continued in 1977. Preliminary work at Buck Reef indicated reserves of 100,000 tons grading 0.3 troy ounce per ton. The Buck Reef project was to come onstream in 1979 and produce 1,125 troy ounces of gold per month.

Iron Ore.—Teams from the People's Republic of China continued a program of study and evaluation on the Chunya iron ore deposits in southwestern Tanzania. The Government planned to develop an iron and steel industry near Mbeya based on iron ore from the Chunya deposits and coal from the Songwe-Kirwera coalfields.

Digitized by Google

NONMETALS

Cement.—Output of cement from Tanzania's only cement plant at Wazo Hill near Dar es Salaam remained well below rated capacity of 340,000 tons per year. Cement imports continued to increase to meet the country's cement demand. An expansion program was in progress to increase capacity at the Wazo Hill facility to 600,000 tons per year. Two new cement plants were under construction: F. L. Smidth of Denmark was supplying the major components for a 500,000-ton-per-year cement plant at Tanga in the northeast and a 250,000-ton-per-year plant at Mbeya in southwestern Tanzania near the Zambian border. The Wazo Hill expansion was to come online in 1978, and the new plants at Tanga and Mbeya were to commence production in late 1979.

Diamond.—Diamond production decreased 7% in quantity but increased 15% in value owing to the increase in price on the world market. The Mwadui mine in northern Tanzania was responsible for the bulk of the nation's production and the decline in production was attributed to the decreasing grade of ore treated.

Gem Stones.—A wide variety of gem-quality minerals were produced by smallscale operations in northern Tanzania. In 1977, gem stone production of amethyst, beryl, corundum, garnet, zircon, and zoisite (tanzanite) was valued at approximately $81,000. Tanzania Gemstone Industries, Ltd. functioned as the nation's only authorized dealer to export precious and semiprecious stones.

Fertilizer Materials.—*Phosphate.*—State Mining planned to mine the guano derived phosphate deposits at Minjingu Koje near Lake Mangara, 112 kilometers west of Arusha in northeastern Tanzania. The deposit contains approximately 10 million tons of ore with an average grade of 20% P_2O_5. Samples have been sent for testing to the Tanga fertilizer plant which manufactures complex fertilizers from imported materials.

Salt.—For the past several years, salt has been one of Tanzania's most valuable mineral products. The largest producer was Nyanza Salt Mines Ltd., which produced salt by solar evaporation of brines pumped from saline springs at Uvinza, 110 kilometers east of Kigoma. The Uvinza operation satisfied the salt demand of western Tanzania and exported about 6,800 tons to Zaire and Zambia. Coastal saltworks near Tanga, Dar es Salaam, Kunduchi, Mtwara, and Lindi produced salt for domestic consumption. An additional and considerable amount of salt was collected from various salt lakes and playa deposits by local inhabitants for their own consumption and for trading purposes.

Other.—Minor quantities of kaolin and glass sand were extracted from the Pugu Hills, about 25 kilometers west of Dar es Salaam. Kaolin reserves there were estimated to be 2 billion tons, and State Mining has attempted to raise sufficient capital to finance a large-scale operation (50,000 tons per year).

The Lake Natron soda ash deposits have been studied, and Japanese firms have expressed considerable interest in their development. The lack of adequate transport facilities and the existence of an established soda ash operation at Lake Magadi in Kenya have deterred development at Lake Natron.

MINERAL FUELS

Coal.—Teams from the People's Republic of China continued investigations in the Songwe-Kiwera coalfields in southwestern Tanzania near the Malawi border. The studies and recommendations to the Government are to be completed by 1980.

Natural Gas.—The Oil and Natural Gas Commission (ONGC) of India, working under a service contract for the State agency Tanzania Petroleum Development Corp. (TPDC), confirmed a natural gas discovery on Songo Songo Island in 1977. Estimated reserves were placed at 30 billion cubic meters. ONGC planned to drill another well to assess the size of the reservoir in 1978.

Petroleum.—Efforts to find an indigenous supply of crude oil in Tanzania continued in 1977. Agip Tanzania Ltd. held a service contract with TPDC covering a 16,486-square-mile onshore and offshore area along the eastern coast. Oceanic Exploration Co. retained a 15,400-square-mile offshore area under a service contract with TPDC. Service contracts required that the companies bear all development costs with the Government in order to receive 50% of any production.

The Dar es Salaam petroleum refinery operated by Tanzania & Italian Petroleum Refining Co. Ltd. had a throughput of 664,000 tons in 1977 and provided most of the nation's requirement of refined petroleum products. Imports of crude oil and petroleum products continued to be restrained owing to Tanzania's foreign exchange shortage.

The Mineral Industry of Thailand

By Gordon L. Kinney[1]

The Thai economy registered gains in construction, mining, and manufacturing, and benefited from higher agricultural and mineral export prices and increased tourism in 1977. The economy showed an improvement over 1976; Thailand reached the targeted growth rate of 7%. These gains would have been larger except for lagging productivity in the agricultural sector, serious drought in one section of the country, and a record high foreign trade deficit. Although declining food prices in December kept the inflation rate just under 10%, price rises in other commodities caused serious concern that real wages would deteriorate for the workers. The rate of inflation will likely surpass 10% in 1978.

The gross national product for 1977 was reported to be over $18 billion,[2] a growth of more than 11% at current prices and more than 7.7% in terms of constant 1962 prices.

Farming continued to employ about 70% of the labor force but its relative importance in the Thai economy dropped from 34% of the gross domestic product (GDP) in 1973 to a little over 28% in 1977. Mining and quarrying, on the other hand, have gained in relative importance during the last 3 years, contributing 1.3% of GDP in 1975, 1.42% in 1976, and 2.0% in 1977. The increased value was also reflected in the employment data, which varied widely from month to month. Total mining industry figures, with December as the index month, showed that employment increased from 40,000 in 1975 to over 58,500 in 1977. The tin and tin-tungsten operations were the dominant employers in the mining industry and Thailand's relative dependence on these operations for mining employment has increased steadily in recent years, from 75% in 1974 to over 83% of the mining work force in December 1977.

Several developments in the tin sector contributed to a 66% increase in the value of tin production in 1977. A major factor was a substantial rise in the world price of tin. Another was that Billiton Thailand Ltd., and the Government's Offshore Mining Organization signed a sliding scale agreement to dredge for tin in the offshore waters. This permitted the dredge *NARAI*, the world's largest suction-cutter dredge, to resume operating after nearly 2 years of inactivity. The additional production from *NARAI* contributed to the 18% increase in overall tin production.

In the natural gas sector, two more gas strikes confirmed the availability of commercial deposits of natural gas in the Gulf of Thailand. The overall situation, however, showed little change during the year because no agreement was reached in tedious gas-pricing negotiations between the oil companies and the Government. Eventually, the development of the domestic natural gas reserves will be a strong stimulus to industrial growth of the Sattahip to Bangkok area, and will help to lessen the current large foreign exchange outlay for imported crude oil.

The new Investment Promotion Act officially became effective on April 29, 1977. Its primary purpose was to encourage investment outside the Bangkok metropolitan area. Mineral prospecting, mining, ore dressing, smelting, and the processing or production of various metals or nonmetallic minerals were among the areas that were eligible for promotional privileges. The Act created 10 investment promotion zones, with extra investment incentives. These incentives included a substantial business tax reduction for up to 5 years, a 50%

Digitized by Google

reduction of corporate income tax for 5 years, liberalized tax deductions from taxable corporate income, and tax deductions for infrastructure construction expenses for 10 years.[3]

The new law reportedly makes Thailand as favorable an area for investment in terms of promotional privileges as any country in the area. The passage of the law emphasized the Government's concern for hastening economic development in Thailand. Further encouragement to investment was provided by the establishment of an Investment Services Center. This was to be a "one-stop shop" where potential investors could obtain the necessary permits and approvals needed to begin a new mining or production operation. Businessmen had previously complained of lengthy delays and the undue redtape needed before any project was approved.

Just 1 year after the military seized power and installed Tanin Kraivicxien as Premier, the same group of generals who appointed him, removed him from office and an interim Government was announced on November 11, 1977, headed by General Kriangsak Chamanan. The new Government was well received by the people and the business community.

PRODUCTION

Thai mineral production is strongly oriented to the export market. Domestic demand is negligible except for small amounts of lignite, barite, manganese, lead, and some of the nonmetallics used in the construction industry. Production of tin and tungsten increased markedly in response to higher world prices. Production of manganese ore, gypsum, fluorite, feldspar, kaolin, iron ore, marl, quartz, and limestone also increased. On the other hand, antimony ore, lead ore, barite, phosphate, and lignite production all decreased. The value of tin concentrate production for 1977 was approximately $250 million, a 66% increase over the 1976 figure. Tungsten concentrates were valued at $45 million, up 50% over 1976.[4] The overall value of mineral production increased by more than 50%, to $331 million in 1977, surpassing the previous record of $231 million set in 1974.

TRADE

The value of trade in 1977 totaled over $8 billion, an increase of more than 21% over 1976 figures. Exports in excess of $3.5 billion were offset by imports of over $4.5 billion, resulting in a balance of trade deficit of more than $1 billion. This was an increase in the deficit of about 68% over 1976. Japan was again the major market for Thai exports, but taking only 20% of the total, a significant decline from the 26% in 1976. The Netherlands, United States, and Singapore followed with 13%, 9%, and 7%, respectively.

Agricultural products were the major foreign exchange earners, accounting for over 60% of total exports. In 1977, rice exports alone were a record 2.8 million tons and were valued at about $675 million or 19% of total exports.[5] Tapioca, sugar, and rubber also contributed over $300 million each in value. Poor weather conditions during the 1977-78 crop season will bring an estimated 10% smaller rice harvest. As a result of this and lower reserve stocks, restraints were imposed on 1978 rice exports. The Government lowered its 1978 rice export forecast to a conservative 1.2 to 1.4 million tons. The drought conditions also affected other farm products and no substantial increase in other agricultural exports is likely in 1978.

Mineral trade was generally good for the year. Encouraged by high world prices for tin and tungsten, Thailand exported minerals and metals worth about $320 million in 1977. Of this total, tin accounted for about $246 million. Other major exports were tungsten, fluorite, and cement. The gross value of precious stones exports ranked second, but much of this value was from the cutting and polishing of imported rough stones. Overall, minerals ranked fourth as a major export, coming between sugar and rubber in value.

Thailand's major imports, in descending order, were machinery, mineral fuels and lubricants, manufactured goods, and chemicals. Nearly one-third of total imports came from Japan, with the United States, Saudi Arabia, and the Federal Republic of Germany supplying 13%, 8%, and 6%, respectively. These countries have supplied the same relative proportions of Thailand's major imports during the last 3 years. The value of mineral fuels accounted for over 22% of total imports, a figure that also has remained relatively constant since 1974.

COMMODITY REVIEW

METALS

Antimony.—Production of antimony dropped nearly one-third in 1977, to about 5,800 tons of 60% concentrate. Antimony metal output fell even more to less than 160 tons, or one-third of the 1976 level. The 4,000 tons of concentrate exported was estimated to value less than $4 million in 1977. An additional 60 tons of refined metal was also exported.

The lower world prices for antimony during the year were probably the main cause of the production slump. Most of Thailand's antimony is mined in small-scale manual operations that are highly sensitive to price fluctuations. When the price gets too low the diggings are simply closed until prices recover. Employment went from 2,180 persons in 44 antimony mines during December 1976, to a low of 1,280 persons in 23 active mines in November of 1977. At year-end, the employment figure increased modestly to over 1,700 in active mines.[6]

Iron and Steel.—Iron ore production, while more than doubling in 1977, was still of little actual significance in the mineral production of Thailand. About 63,000 tons of ore were produced and consumed locally in a small blast furnace at the Siam Iron & Steel Co. Ltd.'s plant. Five plants in the country have smelting capability and 24 firms have rerolling mills. The five smelters produce bars, wire rod, and sections for the construction industry. The rerolling mills have a combined capacity of about 300,000 tons per year of bars.[7]

Plans for the construction of a direct reduction sponge iron plant continued to be discussed in industry and Government circles. The discovery of natural gas in the Gulf of Thailand changed the plans for using lignite as the reductant. A Government committee selected an Austrian consultant firm to study the feasibility of setting up a direct reduction plant using natural gas as both the fuel and reducing agent. The study was begun in November and was expected to be completed early in 1978.

The Government would like to see some sort of integrated steel production based on local minerals and fuels. Thailand presently consumes over 1 million tons of steel per year, almost all of which is imported either as semimanufactures, scrap, or ingots.

The Government planned to continue surveying the central and eastern provinces for additional iron ore reserves. Thailand's present iron ore reserves are placed at about 40 million tons in scattered small deposits.

Tin.—Thailand's most valuable mineral commodity continued to be tin during 1977. Total production of 73% concentrate from all mining methods was reported at over 33,000 tons, an 18% increase over 1976. The smelting of the concentrate by the Thaisarco plant at Phuket produced about 23,000 tons of metal, more than 10% of world

Digitized by Google

production. The production was valued at about $250 million, an increase of 66% over 1976, a result of the large increases in world tin prices. In addition to the reported production, up to 5,000 tons of tin concentrates may have been smuggled out of Thailand during 1977 to avoid payment of Government royalties.

A breakdown of mining methods showed that gravel pumping still predominated but was steadily losing ground to other techniques. Offshore dredging should show a sizable increase in the next few years. Tin-mining methods and output by type of operation in Thailand, in metric tons and percent of annual production, follows:

Type of mining operation	1973		1974		1975		1976		1977

Billiton Thailand Ltd., which bought out the old TEMCO holdings and equipment, signed a 5-year contract with the Government's Offshore Mining Organization (OMO) to dredge in Phangnga Bay off Phuket. The final agreement called for a sliding scale arrangement in which Billiton's revenue goes from 68.75% of the first 1,300 tons of tin produced per year, down to 40% of all over 1,700 tons per year. Operations began in January 1977. The big *NARAI* dredge (formerly *TEMCO II*, the world's largest suction-cutter dredge) was expected to produce about 1,500 tons of tin-in-concentrate during the year.

The Government introduced a new sliding scale tin royalty schedule effective July 15, 1977, designed to increase Government revenue in light of the marked world price increases in tin. The royalty increases were not popular with the industry. Also, the royalty increases fell heavily on the Government's own OMO because of the contract terms with Billiton. The higher payments made the already widespread smuggling of tin concentrate even more attractive to the smaller or marginal mine operators. By yearend, the Government was reportedly reviewing the situation and an announcement of a lowering of the rate was expected in January 1978.

In an effort to encourage more tin mining, the OMO signed a 5-year contract toward the end of the year, with Sethasap Karn Rae Co., a Thai firm, to operate two 270-ton-per-year bucket dredgers off the west coast of Phangnga Province. The sliding scale contract conditions were a little stricter than with Billiton. The company will receive from 58.15% to 44.15% of the receipts from the ores mined, depending on the Malaysian tin price. OMO receives the remainder and is to pay royalty from its share.

In December 1977, the Thai Cabinet was reportedly ready to approve an OMO proposal to purchase and operate directly an $18 million deepwater dredge from a Netherlands firm. Actual construction will probably be done in Singapore. Through direct operation by OMO, and not through a contractor, the Government would increase revenue considerably and also allow a tighter control of the offshore mining operations.

In an effort to lower transportation costs from the tin-mining areas north of Bangkok, the Department of Mineral Resources issued licenses for construction of three new small smelters near Bangkok. In the past, all tin for export was by law required to be smelted at the Thaisarco smelter at Phuket. The other two smelters in Thailand are small, 5 tons per month capacity, and cannot meet international quality standards.

The new licensees were: (1) Thailand Present and Smelting Co, Ltd. (Thaipasco),

Digitized by Google

reportedly in Nakhon Pathom about 55 kilometers west of Bangkok, capacity at least 3,600 tons per year; (2) Thai Pioneer Enterprise Co. at Amphoe Bang Kradi near Pathum Thani in Pathum Thani Province, capacity 3,600 tons per year; and (3) Mr. Suchin Sadcharnong, Bangkok, capacity 360 tons per year. Construction began during the year on the $3.7 million Thaipasco project, a joint venture reportedly by Thai, Swiss, and Federal Republic of Germany firms. Reported financing difficulties may delay or cancel plans for the other two smelters.

Tungsten.—Tungsten has been Thailand's second most valuable mineral since 1972, when it surpassed the value of fluorite mined. Production of tungsten concentrate increased about 7% during 1977, to 4,276 tons, ranking Thailand about fifth in the world among market economy nations. The value, however, reflecting the year's higher prices, increased about 50% to around $45 million. Exports of tungsten were in the form of scheelite and wolframite concentrates and were roughly equal to the amount produced, since there were no chemical processing facilities in the country. As in the tin industry, a considerable amount of tungsten concentrate was smuggled out of the country to avoid payment of the taxes.

There were 17 tungsten lode mines in operation at yearend 1977, and 197 tin-tungsten placer mines. Much of the country's tungsten was produced in conjunction with tin placers. Over 600 people were employed in tungsten lode mining. About 6,200 additional workers were counted as tin miners but they contributed up to 40% of the tungsten output.

Uranium.—Thai Government sources reported the discovery of uranium ore deposits about 390 kilometers northeast of Bangkok. At least 20 drill holes in Khon Kaen Province intersected uranium occurrences well above the minimum required for commercial ore. The tonnages available have not been determined but drilling is continuing. Another discovery was also reported northeast of the first but in a remote jungle-covered area that made prospecting more difficult. The nature of the geologic formations in the deposits is similar to the Colorado Plateau uranium deposits in the United States.

If these deposits prove to be commercially exploitable, their discovery could be an important factor in the Government's long-studied plan to build a 600-Mw nuclear powerplant at Ao Pai in Chon Buri Province. The Government's consideration of a nuclear powerplant has been extremely controversial and each new Government that comes to power must consider the advantages and disadvantages of this extremely expensive and politically sensitive project.

Zinc.—After years of planning, research, negotiations, and delays, the Thai Zinc Ltd., a subsidiary of New Jersey Zinc Co., finally signed a contract on July 18, 1977, with the Thai Government, permitting the construction of an electrolytic zinc refinery, and mining of the rich zinc ores. Capacity of the refinery was to be at least 40,000 tons per year.[8] It will be located at the provincial capital of Tak (16°52'N, 99°08'E) in northwest Thailand. The ores, containing smithsonite and hemimorphite, will be mined at Mae Sot (16°40'N, 98°40'E), 70 kilometers west of Tak and only a few kilometers from the Burmese border. New Jersey Zinc Co. built a pilot plant at its research facilities in Palmerton, Pa., to test the complicated leaching cycle needed to economically refine the 25% zinc content ore.[9]

Despite the contract signing, construction of the refinery was not likely to begin soon. A land ownership problem was encountered in November 1977. Thai Zinc Co. filed a civil suit in Bangkok on November 7 to obtain title to the 400 hectares of land the refinery was to be constructed on. The land had been purchased for Thai Zinc Co. by a third party in 1973 at a time when the company did not have the right to own land. Also, terms of the contract with the Department of Mineral Resources state that Thai Zinc Co. had 6 months to arrange financing for the project and 30 months to complete the work. At yearend, little progress had been made toward the financing and it was rumored that the Whashin Industrial Corp. of the Republic of Korea, the proposed prime contractor for the refinery, was interested in financing the project as well.

Total cost of the project would be over $100 million and the cost of just the refinery was set at about $40 million.

NONMETALS

Barite.—Production of barite dropped in 1977 to under 120,000 tons valued at over $5.5 million. The decline in production was again due to a lack of demand for drilling and in the oil exploration industry in South-

Digitized by Google

east Asia.

Cement.—The cement industry operated at 99% of rated capacity in 1977. Just over 5 million tons was produced, a 14% increase over 1976. The Board of Investment (BOI) announced it would accept applications for new plants to increase production by not less than 1.6 million tons per year by 1981, and by a similar amount by 1983. Minimum plant size per application was to be 800,000 tons per year and Thai shareholding of not less than 60% was required.[10] Because of the high domestic demand, exports of portland cement dropped to 292,000 tons in 1977. Indonesia, United Arab Emirates, and Hong Kong received over two-thirds of the total cement exports. The demand increased during the year and finally, on November 30, 1977, the Ministry of Commerce, in order to alleviate the growing shortage, prohibited all exportation of cement. It was necessary to import foreign cement toward yearend and the Foreign Trade Department forecast that these imports would increase steadily to about 1.2 million tons per year by 1980. Imports of 210,000 tons of cement were authorized by the Ministry of Commerce for 1978. In light of a proposal to build a deepwater port, a new airport, and the gas pipeline project, the projected cement demand could be much higher than Government's estimate of 6.8 million tons in 1980.

Fluorite.—Two applications were made at yearend to the BOI to open new fluorite mines. One was to be at Amphoe Khlong Thom, in Krabi Province and have a 30,000-ton-per-year capacity of chemical grade fluorite. The other application was to engage in mining or dressing of ore to produce annually, 12,000 tons of metallurgical-grade, 60,000 tons of low-grade, and 90,000 tons of crushed low-grade fluorite. The plant would be located at Amphoe Mae Tha, in Lamphun Province. Proposed employment for the two projects would total over 180 persons. Submission of the application to the BOI does not assure the startup of a given project.

Overall, crude fluorite production rose about 20% in 1977. Production of salable metallurgical grade reached 193,000 tons and 29,000 tons of acid grade flourite was also produced. A total of 242,000 tons of all grades valued at over $11 million was exported. This was the first reversal of the downward spiral that began after the 1974 peak year production of over 428,000 tons.

The Thai fluorite industry was highly dependent on the Japanese steel industry for its major market. The effects of the slump in world steel production, a steady reduction in the amount of fluorite used per ton of steel produced in Japan, and because Japan now buys its fluorite from a variety of sources, combined to cause the severe reduction in Thai export sales. The 1977 increase reflects Thailand's determination to diversify its markets as widely as possible. Some of the recent customers include the U.S.S.R., Poland, Taiwan, the Republic of Korea, the Netherlands, and the United States.

Other.—During 1977 the Asian Development Bank financed a detailed economic feasibility study of the proposed soda ash (Na_2CO_3) plant on the Khorat Plateau in northeastern Thailand. The findings will be presented to the Thai Government in mid-1978. The project would utilize the large reserves of very pure salt and nearby limestone. However, to make the project economically viable, a deepwater port, probably at Laem Chabang southeast of Bangkok and about 160 kilometers of new railroad spur lines would be required. The present transportation system between the deposits and the Gulf of Thailand is incapable of handling the large tonnage of materials that would be required.

In 1972 and 1974 the soda ash project proposal met with considerable local opposition when foreign companies showed an interest in development. In 1976, the Government proposed this as a regional project of the Association of Southeast Asian Nations (ASEAN), in which ASEAN partners as well as private investors will be invited to take an equity interest. Estimated cost of the project would be $160 million, not counting the needed infrastructure improvements.

The Department of Mineral Resources (DMR) continued its potash exploration program in 1977, finding additional large deposits of carnallite ($KMgCl_3.6H_2O$) and highly promising deposits of sylvite (KCl) in the Cretaceous evaporite basins of northeastern Thailand. In October 1977, the DMR reportedly invited a number of companies to submit proposals for further exploration and eventually the development of the deposits.[11]

MINERAL FUELS

Lignite.—The lignite mine at Mae Moh was being mechanized and expanded during

Digitized by Google

1976 and most of 1977. The project, managed by a group of West European firms for the Electricity Generating Authority of Thailand, was designed to furnish a reliable and inexpensive source of fuel to the onsite thermoelectric powerplant. The plant was designed in 75-Mw units. The first unit was reportedly completed in September 1977, and the second unit was scheduled for an August 1978 startup. Two more units are planned for 1981-83.[12] Power generation remains the major end use of Thailand's lignite production. A small amount was supplied to the State-owned Chemical Fertilizer Co. Ltd.

Lignite production was nearly 440,000 tons during 1977, a 35% drop from 1976. The lower production was probably because of the construction work at Mae Moh.

Oil Shale.—Detailed surveying of the shale oil deposit at Mae Sot was begun in February 1974 and continued until May 1977. Over 180 diamond drill holes were sunk to delineate the deposits. The survey was not complete but there is little chance of the Government beginning exploitation of these deposits, regardless of the reserves, considering the imminent development of the natural gas deposits in the Gulf of Thailand.

Natural Gas and Petroleum.—On March 9, 1977, the Thai Government officially announced the formation of the Natural Gas Organization of Thailand (NGOT). The new organization was responsible for the development, production, transportation, storage, purchase, sale, and distribution of natural gas in Thailand. NGOT thus became the authority over virtually all activity connected with natural gas, from granting of exploration licenses to determining its end use.

The three major natural gas strikes made in 1976, were supplemented by two more successful wells in 1977, both by the Texas Pacific Thailand Inc. consortium (Texas Pacific). The Union Oil Co. of Thailand Ltd.'s (Union Oil) reserves are placed at over 1 trillion cubic feet (28 billion cubic meters) and Texas Pacific's reserves are estimated at over 3.4 trillion cubic feet (96 billion cubic meters). At yearend AMOCO was drilling in block 5 for scheduled well completion in early 1978.

Union Oil and NGOT continued the protracted negotiations on pricing of the natural gas discovered in blocks 12 and 13. Although both sides were anxious to sign a contract, each felt the other's price was unreasonable. No construction will begin until the talks result in a firm contract. Despite the impasse, which may continue well into 1978, the NGOT has hired consultants to evaluate sea and seafloor conditions along the proposed pipeline route from the gas deposits to Bangkok. Tentative alinement of the pipeline would be approximately north for about 400 kilometers to landfall near Rayong east of Sattahip. The line will then be laid overland an additional 160 kilometers to Bangkok.

Overall cost of developing the gasfield, laying the off- and onshore pipelines, and building the gas processing plant was estimated at between $500 million and $600 million. This price would not include the cost of developing the Texas Pacific discoveries that would be funded separately.

The Texas Pacific gasfield in blocks 15 and 16 lies roughly 190 kilometers southeast of the Union Oil fields. The bulk of the natural gas consumption will be in the Bangkok area, so the Government planned to bring the gas to market by connecting with the Union Oil pipeline. Texas Pacific will face the same gas pricing negotiations that Union Oil and NGOT are engaged in. It was assumed, however, that once the first settlement is completed, the terms of the Texas Pacific contract would be similar and the contract should be signed without much additional delay.

Domestic oil production was economically insignificant and totaled about 280 barrels per day, and was processed locally at the 1,000-barrel-per-day Fang refinery near Chieng Mai.

The country's three large refineries, totaling 165,000-barrels-per-day capacity, operated entirely on imported petroleum. Imports of crude oil and topped crude oil to these refineries totaled about 9.7 million kiloliters (61 million barrels) at a cost of over $820 million.[13] The main source of imports continued to be the Persian Gulf countries, with Saudi Arabia, Qatar, and Kuwait supplying nearly 84% of Thailand's crude oil needs.

The Mineral Industry of Tunisia

By E. Shekarchi[1]

Production of phosphate rock in Tunisia, the third largest producer among market economy countries, was in the hands of Cie. des Phosphates de Gafsa (CPG), which operated eight mines, seven of them in the Gafsa basin. Total sales of phosphate rock reached 3.7 million tons in 1977, compared with 3.5 million tons in 1976. The increased demand was largely from the domestic market, which used an additional 175,000 tons in 1977. Production of other minerals such as fluorite, barite, iron, lead-zinc, silver, and marine salt contributed significantly to the otherwise agrarian economy of Tunisia. The preliminary gross domestic product (GDP) for 1977, based on current prices, was estimated at $4.9 billion, an increase of 11% over the 1976 GDP. Per capita GDP increased 8% to about $825 from $762 the previous year.

The fifth development plan (1977-81) was initiated during the year with the following goals: To reach self-sustaining economic growth free from dependence on external assistance, to provide a job for each new entrant into the labor force in 1981, and to maintain an annual real growth of 7.5%. Total industrial investment, including energy and mining, was to be $7.8 million annually under the fifth plan. Four capital-intensive sectors were to receive the bulk of the financing — phosphates, fertilizers, chemicals, and electric power. The major industrial investment projects foreseen were a program to double output of phosphate rock, a new nitrogenous phosphate fertilizer plan, a third unit shifting the phosphate industry toward intermediate finished products, four new cement plants, and development of the Miskar offshore natural gas field. Gas, to be available by 1981 from the Algerian-Italian pipeline transiting Tunisia and from Miskar gasfield, was regarded as the energy key to industrial development and the means to reserve crude oil for export. Production of petroleum, the most important mineral industry both now and in the future, reached 90,000 barrels per day, and output was to increase to 120,000 barrels per day by 1981. Petroleum production was anticipated to increase further if offshore prospects materialize. The first steps were taken toward arbitration of an offshore boundary dispute between Tunisia and Libya, the settlement of which could be beneficial to both parties.

The Trans-Mediterranean gas pipeline, to carry 1,200 million cubic meters annually of Algerian gas through Tunisia and across the Mediterranean to Italy, came closer to reality during the year when strained relations between Algeria and Tunisia were finally relieved and Italy and Tunisia signed an agreement for construction of the pipeline. The pipeline was scheduled to be completed by 1980, and not only was it to supply Italy with natural gas for the next 20 years from Algerian fields, but Tunisia was also to receive a percentage of the natural gas instead of cash payments for royalties.

PRODUCTION AND TRADE

Available data on mineral production are given in table 1. Data on exports and imports are given in tables 2 and 3, respectively.

COMMODITY REVIEW

METALS

Iron and Steel.—Iron ore production from Djebel Djerissa Tamera, Douaria decreased to 343,000 tons in 1977 from 495,000 tons in 1976. Exports of iron ore declined to 102,000 tons in 1977 from 155,000 tons the previous year. The remainder of production was used indigenously, supplying the El Fouladh and Menzel Bourgiha steel mills. The expansion of the El Fouladh steel mill, by addition of a 30,000-ton-capacity electric arc furnace, was completed, and the company produced 464,000 tons of cast iron and steel in 1977.

Since easily retrievable deposits of hematite ore were about to be exhausted and most of the production was from iron-carbonate reserves, the Government made the decision that after 1978 no iron ore is to be exported. All operating mines in 1977 were underground and expensive to oper-

Digitized by Google

ate; however, domestic production was more economically viable than importation of ore from abroad.

Lead and Zinc.—The Government-owned mining company Soc. Tunisienne d'Expansion Minière (SOTEMI) was the sole producer of lead and zinc ore in 1977. Lead concentrate continued its long decline, with output totaling only 16,500 tons in 1977, while zinc concentrate registered a gain to 13,000 tons.

Refined lead was exported to Greece (6,000 tons) and Italy (5,000 tons), and in small amounts to other European countries.

NONMETALS

Cement.—Cement production continued to receive national priority, and significant investments were made in 1977 and for the coming year. Tunisia produced 630,000 tons of cement in 1977 which was slated to increase to 930,000 tons in 1978 and 1.5 million tons in 1979. Demand for cement continued to grow in this rapidly developing country, and cement imports met 60% of demand in 1977. The planning organization set goals of reducing import dependence and becoming a net cement exporter by 1981.

Work on the cement plant in western Tunisia near the Algerian border continued, completion set for 1979. Work on a new cement plant in central Tunisia began in late 1977, and cement plants at Bizerte and Gabès produced at full capacity during 1977. Construction of the plant near Bizerte for asbestos cement products, primarily pipe, continued during the year at a cost of $10 million. The facility, expected to produce 26,000 meters of pipe for irrigation and sanitation purposes, was to go into production by the end of 1979. The plant was financed by a group of private investors under the name of Ciment-Amiante-Tunisia.

Fertilizer Materials.—In 1977, Tunisia produced 3.6 million tons of phosphate rock, a 9% increase over the 1976 output. The price of Tunisian phosphates on international markets, however, decreased 26% in 1977, accompanied by a slight decrease in the price of the superphosphates exported. For this reason, the 1977 foreign exchange earnings of phosphates remained at the 1976 level, although quantities exported increased. This price decline affected production projections for future years, as 4.1 million tons was forecast for 1978. The phosphate mining industry was concentrated in the Gafsa basin in south-central Tunisia. During 1977, there were eight mines operating in this basin, one opencast (Kef es Schfair) and seven underground, in which longwall and load-haul-dump mining techniques prevailed. Phosphate-processing plants were also centered in the Gafsa area, usually close to the mine and connected by State railways. In 1977, six phosphate rock washing plants were in operation, with four more expected to be online by mid-1980.

A phosphoric acid production plant was operated in Gabès by Industrie Chemique Maghrebines (ICM). The facility included a triple superphosphate plant and sulfuric acid plant. ICM used two long-term chartered tankers to export its product and processed 1 million tons of phosphate rock in 1977.

Tunisia continued its ambitious plan to double phosphate production to approximately 7 million tons between 1976 and 1981. By the end of 1977, it was apparent that this level of production will not be achieved by 1981 but could well be obtained by 1985. To achieve better coordination among various sectors of the phosphate mining and processing organizations, the Government proposed a new office, Groupment Public des Phosphates et Derives, to be established during the coming year. The chief responsibility of this office will be to bring together various phosphate company representatives with Government ministry representatives interested in mining and national planning.

The World Bank committed a loan of $23 million to assist Tunisia in doubling production of phosphate, and the Abu Dhabi Fund for Arab Economic Development provided investments of $189 million for the first stage of an ambitious program for six plants at Gabès, forecast to produce 170,000 tons of phosphoric acid and 330,000 tons of ammonium phosphate annually. Operation of the Gabès plant is to be managed by Soc. d'Engrais Phosphates et Azotes (SEPA) and involves two existing phosphoric acid producers at Gabès.

Other.—Fluorspar production decreased 16% in 1977. Unlike in previous years, most of the production was earmarked as feedstock for Industries Chemiques de Fluor's aluminum fluoride plant, which started full production in 1977. Barite, which has found limited use within the country, is associated with fluorite in the Zriba mine. Most of the barite had accumulated in the waste ponds. The only other nonmetals produced were

Digitized by Google

lime, which increased 6% in 1977, and marine salt, which increased 41%.

MINERAL FUELS

Natural Gas.—Tunisia's energy plan through 1985 is principally based upon the use of natural gas for industrial and power projects, thus reserving crude oil for export. A decision was made in 1977 to proceed with development of the domestic offshore gasfield to meet domestic industrial needs. However, the successful revival of the project for a pipeline to transport Algerian gas across Tunisia and the Mediterranean Sea to Italy gave Tunisia another option, with negligible capital costs compared with the nearly $500 million estimated for Miskar. The gas-based energy policy remained unchanged and the Government contracted for drilling of the reserves and studies of the economic feasibility of this project.

Production of natural gas increased by about 116 million cubic meters in 1977. About 250 million cubic meters of total production was consumed by domestic industries for power generation and other industrial uses.

Petroleum.—While still small by world standards, Tunisia's petroleum production provided its largest source of foreign exchange and a domestic energy base for industrialization. As a result of secondary recovery programs in the two major Tunisian oilfields and small new producing areas onshore, Tunisia's output increased to 4.3 million tons in 1977 from 3.7 million tons the previous year. Annual consumption increased to about 1.8 million tons, which still left Tunisia with a large net trade surplus on the energy account. Development drilling in 1977 involved 13 wells. Of the 10 wells in the El Borma field, 7 were for production and 3 were for water injection. Two production wells were drilled in the Ashtart field and one in the Sidi El Itayem field west of Sfax. In 1977, there were a total of 12 wildcat wells, 11 of which were offshore. The upward trend in exploration activity was more clearly evident in geophysical work; 9,900 kilometers of seismic surveys were completed in 1977, compared with 4,000 kilometers in 1976. Wildcat drilling in 1977 resulted in two finds each of oil and combustible gas. At yearend, there were 17 active permits. The total area subject to exploration permits was 146,000 square kilometers, of which 71,000 was offshore.

Output of the country's only refinery at Bizerte was 1.22 million tons in 1977. Both economic and energy considerations made it more advantageous for Tunisia to export most of its own crude oil, importing 97% of its oil from Iraq and Saudi Arabia to fuel the Bizerte refinery. Petroleum pricing in Tunisia continued to be below the world market for all products except gasoline during 1977.

The Mineral Industry of Turkey

By T. John Rowland, Jr.[1]

The mineral industry of Turkey directly contributed about 1% of the gross national product (GNP) of $46 billion[2] in 1977. According to estimates by the State Institute of Statistics, Turkey's GNP grew 5% in 1977; the highest growth rate was recorded by the industrial sector at 7%. Turkey's development plans give high priority to the mineral sector.

The lack of available usable energy is one of Turkey's fundamental economic problems. Turkey, a minor producer of petroleum, was deeply affected by the worldwide rise in oil prices in 1973. The proportion of oil imports to total domestic needs has increased sharply in recent years. In 1972, petroleum imports cost $124 million and constituted 7.9% of total imports, while in 1977 the cost of petroleum imports increased to $1.2 billion and accounted for 20% of import value. Turkey's plans are to develop lignite and hydroelectric resources to reduce its reliance on oil.

Investment in the mineral sector, including petroleum, was $418 million in 1977. The bulk (94%) of this investment went to public sector mines. Maden Tetkik ve Arama EnstitüSü (MTA) (Mineral Research and Exploration Institute), a State organization, was responsible for the full spectrum of mineral exploration activities from basic geological studies to the preparation of mining feasibility studies. MTA employed 2,000 technical and professional personnel with a budget of $120 million in 1977. Total planned expenditures by MTA for the period 1977-82 were allocated as follows, in million dollars:

Commodity	Expenditures
Base metals	117
Iron ore	97
Chromite	40
Ceramic and refractory raw materials	36
Phosphate	14
Bauxite	13

Mining activities in Turkey were legislated by Mining Law 6309, enacted in 1954, Petroleum Law 6324 of 1954, and the amended Petroleum Reform Law 102 of 1973. The Government owned all mineral resources and granted exploration and mining permits. Mining activities were conducted in Turkey by major State-owned economic enterprises such as Etibank Genel. Mudurlugu, Black Sea Copper Co., and Türkiye Komuleri Işletmesi (TKI) Turkish coal works and by private companies. A bill to nationalize the mining of boron, lignite, and some other important minerals was examined by the Government but had not been approved by Parliament by yearend.

During 1977, the Government introduced an economic stabilization program to reduce the Government's budgetary deficit. One of the major budgetary measures was an increase in the prices of products marketed by the State Economic Enterprises (SEE). This measure was to reduce SEE deficits, most of which were subsidized by Government revenues. Another important measure was an increase in the price of energy, including gasoline which nearly doubled in price. Before the September 9, 1977, increase, gasoline was selling at a

Digitized by Google

lower price in Turkey than in any other European country.

PRODUCTION

Mineral production registered both gains and losses in 1977. Increases were evidenced in the production of bauxite, boron materials, copper ore, magnesite, perlite, and sulfur ore. Commodities registering declines included iron ore, pyrite, chromite, and mercury. The production of mineral fuels (lignite, bituminous coal, and petroleum) remained relatively stable compared with that of previous years.

TRADE

In 1977, mineral exports increased to $200 million or 7% of total exports. Principal mineral exports were boron materials ($80 million), chromite ($60 million), and magnesite ($12 million). Other significant mineral exports included meerschaum, diasporite, emery, zinc concentrate, and alumina. Imports of minerals increased 32% in 1977, accounting for $111 million or 2% of total imports. Phosphate rock, iron ore, and coking coal were the leading nonfuel mineral imports.

COMMODITY REVIEW

METALS

Aluminum.—Located principally in the Taurus Mountains, bauxite deposits were estimated to contain reserves of 400 million tons of 46% Al_2O_3. MTA calculated that Turkey possessed 4% of the world's known bauxite reserves.

Etibank's aluminum smelter at Seydisehir operated at about 25% of capacity most of the year because of a shortage of electric power. The capacity of the Seydisehir Integrated Aluminum plant (SIA) was rated at 200,000 tons of alumina, 60,000 tons of aluminum, and 34,000 tons of semifinished products per year. The primary bauxite minerals processed by SIA were boehmite and gibbsite.

Antimony.—Production of antimony ore in 1977 was 38,318 tons, an increase of 12% over that of the previous year. The major producing mine, Turhal, was situated near Tokat in central Anatolia. Substantial reserves were known in the Balikesir-Kutahya and Aydin regions. Tectomin (Italy) was contracted to construct a 2,600-ton-per-year antimony plant in the Province of Balikesir. Production at the plant was expected to begin by the end of 1978. MTA estimated Turkey's reserves of antimony at 2.4 million tons, which was nearly 1.7% of the world's known reserves in 1977. Demand for antimony in the world market stimulated MTA exploration for economic deposits in the western and central areas of Turkey.

Chromite.—MTA calculated chromite reserves at 35 million tons in 1977. Chromite deposits in Turkey are associated with ultrabasic rocks, especially peridotite and serpentine. Chromite production by both State and private enterprises totaled 905,524 tons in 1977, a decrease of 4% from that of the previous year. Output of chromite concentrates increased 10% in 1977 from the 1976 level. Etibank's new ferrochrome plant at Elazig produced 25,000 tons of high-carbon ferrochrome in 1977, which represented 50% of the plant's capacity. The Elazig plant was to commence full production in 1978. Construction continued on a ferrochrome plant near Mardin with production of 50,000 tons per year scheduled for 1978.

Digitized by Google

Etibank was conducting an exploration program at the Guleman ore district believed to be a potential source of high-grade metallurgical chromite.

Copper.—Production of copper ore in 1977 increased 14% to 2.3 million tons. MTA estimated reserves of copper at 4 million tons of metal equivalent. Deposits were located in Ergani, Cakmakkiay, Damar, Cayeli, Kure, Lahanos, and Madenkoy. Etibank and Black Sea Copper each operated a mine in the Black Sea Zone (Küre) and on the East Anatolian Massif (Murgul). Black Sea Copper was 72% State owned, of which Etibank controlled 29.4%. The remaining 28% ownership was private, with Işbank as one of the principal shareholders. Black Sea Copper planned to increase the output of copper ore at the Murgul mine to 4.1 million tons per year and to increase concentrator capacity to 180,000 tons per year of copper concentrates.

Etibank and Black Sea Copper jointly contracted a Finnish company to construct a concentrator and smelter in Küre in 1978 with an annual capacity of 2 million tons of ore. At Samsun, the Black Sea Copper smelter, with a design capacity of 40,000 tons per year of blister copper, had not reached planned output by yearend. Etibank planned an integrated copper project at Küre-Cayeli to produce 100,000 tons of blister copper annually along with about 50,000 tons of zinc, gold, silver, and cadmium.

Iron Ore.—Iron ore production in Turkey was 3.3 million tons in 1977, a decrease of 8% from the 1976 output. Iron ore reserves of Turkey have been estimated at 870 million tons. Two significant iron ore occurrences are located in Sivas and Malatya Provinces; the Divrigi and the Hassan Celebi deposits. The Divrigi mine supplied lump ore (57% iron) for the State-owned Divrigi Concentration and Pelletizing Plant. The capacity of the mine was 2.6 million tons per year, to be expanded to 5.2 million tons of iron ore per year beginning in 1979.

The Hassan Celebi deposits had reserves estimated at 306 million tons of ore with a grade of 28% to 48% magnetite, equivalent to 118 million tons of 58% iron ore. The ore consisted of low-grade magnetite in nine massive occurrences and occasionally in disseminated form. In Kayseri and Adana Provinces, a large sedimentary iron belt was present. The deposit was analyzed as low-grade ore that would require beneficiation. In the Bitlis Massif of southeastern Turkey, an extensive deposit of iron ore was associated with metamorphic rocks and generally occurred as magnetite. Examination of the Bitlis Massif iron ore indicated that beneficiation would be necessary.

Iron and Steel.—Production of raw steel registered a decrease of 4% to 1.4 million tons. A contributing factor in the decline was a lack of foreign currency which limited the import of capital goods necessary for the industry. Turkey operated three iron and steel plants, with a fourth in the planning stage. The Karabuk iron and steel complex utilized domestic ore from Divrigi, while the Eregli iron and steel plant used both domestic and foreign ore. The 2-million-ton-per-year Iskenderun steel plant produced only iron metal and not steel because of difficulties in importing both coal and iron ore. Expansion of the Iskenderun facility was to increase annual capacity to 4 million tons. Studies were underway for a fourth iron and steel complex with a capacity of 2 million tons per year at Sivas by Ayyildiz of Turkey and Kaiser Steel Corp. of the United States. The feasibility study was expected to be completed by yearend 1978.

Lead-Zinc.—Production of lead-zinc ore increased to 106,250 tons in 1977, an increase of 18% over the 1976 level. MTA estimated reserves of lead at 1.3 million tons and reserves of zinc at 3.6 million tons, both reported in metal equivalents. Three belts of base metal mineralization have been identified by MTA as the most important mining regions in Turkey for copper, lead, and zinc. One belt is associated with the basic volcanic units of the ophiolite rocks that occur in southeastern Turkey. Here, Madenkoy, in Siirt Province, was identified as having the most significant lead-zinc deposits. Another belt extends through southeastern Turkey's central Taurus region. Mineralization is of the strata-bound type containing lead and barite. In northern Turkey, another major belt of base metals extends from the eastern Black Sea area to the western end of the country. The northern belt divides into two sections, one extending through northern Thrace in Bulgaria and the other striking through Balikesir to the south of the Sea of Marmara.

The new Cinkur-Kursun Metal Sanayii A.S. lead-zinc plant at Kayseri in central Anatolia processed concentrates from the Zamanti mines to recover zinc, lead, and silver. Etibank's Keban Works produced

Digitized by Google

lead and zinc concentrates. The ore was extracted by underground mining and concentrated by a flotation plant erected near the mine. The concentrate has 50% lead with substantial quantities of silver. Zinc concentrates produced at Keban Works were principally derived from sphalerite. The flotation plant near the mines produced 40% zinc concentrates. The concentrates were exported for custom smelting and returned as metal for domestic consumption.

Manganese.—MTA reported manganese ore reserves at 32 million tons with a metal content of 30.3%. Production of ore in 1977 amounted to approximately 33,715 tons. No production of ferromanganese was reported in 1977. Production of manganese came from mines between Bolu and Zonguldak and near Denizli, Gaziantep, and Eregli.

Mercury.—Mercury and antimony mineralization are closely associated in Turkey. Reserves of mercury were reported at 12,000 tons in metal equivalent. Production for 1977 from Etibank's Sizma and Halikoy smelters totaled 4,509 flasks, a decrease of 15% from that of 1976. The decrease in production was a result of the decline in world market prices and the subsequent closing of some private companies. Substantial reserves of mercury ore were located in western and central Anatolia. The principal mercury mines were the Halikoy and Turhonu mines near Aydin, the Karaburn mine near Izmir, and the Sizma and Sarayonu mines near Konya.

Tungsten.—The major deposit of tungsten is located in the Ulu Dag Mountains near Bursa. MTA estimated the Ulu Dag deposits to contain 14.5 million tons of ore at 0.3% WO_3. The Elazig-Keban district possessed another 500,000 tons at 0.5% WO_3 ore. Tungsten mineralization occurs in Turkey in skarns in association with contact zones of acid intrusives. The mine and concentrator at Ulu Dag, a joint venture of Etibank and Salzgitter AG of the Federal Republic of Germany, began production in 1976. Approximately 2,000 tons of scheelite concentrates was produced annually and exported to the Federal Republic of Germany for further processing.

Uranium.—Reserves of uranium were reported at 4,000 tons of U_3O_8. Significant uranium mineralization has been located by MTA in the Neogene sediments in various areas. Extensive surveys of the Manisa-Afyon region have been conducted. A pilot plant was established at Koprubas to produce yellow cake (U_3O_8). In mid-1977, a survey by Woods Hole Oceanographic Institute uncovered further uranium reserves in deep water off the Black Sea coast. No other details were known by yearend. MTA carried out surveys on the Neogene basins in Thrace and near Ankara.

NONMETALS

Asbestos.—Production of asbestos, mostly chrysotile, decreased to 3,767 tons in 1977 from nearly 10,000 tons in 1976. Reserves were estimated at 5 million tons of asbestos ore. Principal deposits were located in the vicinity of Sivas, Erzincan, and Bursa. No exports of asbestos were reported in 1977.

Barite.—According to a report by MTA, barite reserves were calculated at over 33 million tons of ore. Barit Maden Turk A.S. (BMT) was the sole producer of barite in Turkey in 1977. The important producing regions were Muş, Alanya, and Konya. Barite occurred throughout Turkey as vein deposits, generally associated with schists.

Boron.—Occurring in Neogene lacustrine sediments, Turkish boron deposits comprised 80% of known world reserves. MTA estimated boron reserves at nearly 506 million tons of ore. The principal deposits are located in the Kütahya-Eskişehir-Balikesir area of western Turkey. Combined production from State and private firms increased 21% to 1.1 million tons in 1977. The Kirka tincal mine has a capacity of 750,000 tons per year. A refinery was planned for Kirka-Eskişehir, the world's largest tincal deposit. Construction of the Etibank plant at Kirka was to cost $65 million, with completion scheduled for early 1978. The refining facilities were to produce 163,000 tons of crude pentahydrate borax, 60,000 tons of crude and anhydrous borax, and 15,000 tons of refined decahydrate borax per year. Upon operation of the facility, Turkey was expected to earn $35 million per year through export of the products.

The Bandirma Borax and Acid Works operated at full capacity throughout the year. Borax decahydrate produced at the Bandirma plant consisted of refined crystals of technical grade containing 37% B_2O_3 and 16.5% Na_2O. The product was exported from the port of Bandirma on the Marmara Sea. Boric acid was also produced at the Bandirma works as technical-grade refined crystals containing 56.2% B_2O_3. The European market was the major recipient of the boric acid.

Cement.—Production of cement in 1977 registered an increase of 12%. Turkish ce-

Digitized by Google

ment production capacity was 14.5 million tons concentrated in 34 plants. By 1980, Turkey expected to increase cement production capacity to nearly 20 million tons per year. The cement plant at Adana, Turkey's largest, was being expanded 67% to a capacity of 1.5 million tons per year by 1978.

Emery.—Reserves of emery were estimated at 9 million tons. Production of emery in 1977 declined 4% to 64,488 tons. Turkey has provided nearly 80% of world emery production. Turkish emery's fine-grain quality has increased the demand for it for use in coated abrasives. Production of emery could be increased with increased demand. Turkish emery contains approximately 62% alumina and 32% magnetic iron oxide. Mugla was the center of the emery industry, and Gulluk was the port of export.

Magnesite.—Turkish magnesite reserves were estimated at over 65 million tons of high-grade ore. In 1977, Summerbank and Etibank undertook an extensive magnesite development program. Several magnesite deposits were located at Eskişehir, Bilecik, Bursa, Denizli, and Içel, and were mined by open pit methods. Production of magnesite increased 21% in 1977. Valued at $12 million, magnesite was one of Turkey's most important mineral export commodities. The plant at Kumas near Kütahya, an Etibank joint venture, produced 70,000 tons per year of sintered magnesite and planned to produce 55,000 tons per year of refractory brick within 5 years. Etibank announced plans to establish a 100,000-ton-per-year sintered magnesite brick plant at Eskişehir. The completion date and cost were not available at yearend.

Marble.—Reserves of marble were estimated at 1.3 million tons in 1977. The provinces of Denizli, Erzurum, Izmir, Kirşehir, and Sivas and Marmara Island were the principal locations of marble deposits. Production of marble in 1977 was 118,600 tons valued at $11.1 million. High-quality marble was exported as both unfinished blocks and finished products.

Perlite.—Production of perlite in 1977 was estimated at 30,000 tons, a 22% increase over that of the previous year. Deposits of perlite are located in central Turkey and in the southwestern regions of Van, Erzerum, and Nevşehir. MTA estimated reserves of perlite to be more than 4.7 billion tons in 1977. Construction of an integrated perlite mine and processing plant continued at Cumaovasi-Ismir. Upon completion, the plant was to produce 137,000 tons per year of processed perlite and 50,000 tons per year of expanded perlite. The second stage of the plant, to be completed in 1978, is to manufacture prefabricated building material. The total cost of the project was set at $15 million.

Phosphate.—Production of phosphate rock in 1977 was reported at 65,418 tons. MTA estimated phosphate reserves at 410 million tons of ore of 10% to 21% P_2O_5. Phosphate reserves were considered adequate to supply the country's needs. A feasibility study was undertaken for the exploitation of the phosphate rock deposit at Mazidag, in southeastern Turkey.

Pyrite.—Production of pyrite declined in 1977 to about 38,300 tons from a 1976 level of 84,630 tons. The Ergani, Murgul, and Küre Copper Works produced pyrite concentrates as a byproduct of copper production. Pyrite concentrates were used for the production of sulfuric acid in Turkish acid plants while cupriferrous pyrite was exported, primarily to the Federal Republic of Germany.

Sulfur.—Sulfur production remained relatively stable in 1977 at 20,040 tons from 89,600 tons of ore. MTA reported sulfur ore reserves of more than 1.6 million tons. Etibank was to expand the Keciborlu Sulfur Works to produce 180,000 tons per year of crude sulfur and 55,000 tons per year of pure sulfur. At Keciborlu, ore was extracted by underground and open pit methods. Production was for domestic consumption with nearly 75% going to the industrial sector and the remainder going to agriculture.

MINERAL FUELS

Coal.—Lignite production from five Turkish operations totaled 8.2 million tons in 1977. MTA estimated Turkish lignite reserves at nearly 5.7 billion tons. Neogene sedimentary basins containing lignite cover vast regions of Turkey. In western and central Turkey, large reserves of lignite are known to exist at Tuncbiek, Seyitomer, Soma, Beypazari, and Yatagan. In southeastern Turkey, another large deposit of lignite is located at Elbistan. The Elbistan deposit was estimated to contain over 3 billion tons of lignite. The expansion of the Elbistan project by TKI continued in 1977 and was near completion. In 1979, output was to reach 20 million tons of lignite, of which 87.5% was to be used to supply thermal powerplants and 12.5% for other domestic fuel requirements. Lignite in the deposit has been rated as of low calorific

Digitized by Google

value that will require treatment before domestic use. MTA reported other Neogene basins of lignite potential including an area near Erzurum where extensive exploration continued throughout 1977.

Bituminous coal reserves were estimated at 1.3 billion tons. Production from the Zonguldak coalfield was 4.5 million tons in 1977. Both advance and retreat longwall methods were used in the underground mining of the bituminous coal. There were six operating collieries. Most hard coal in the Zonguldak district was used by State railroads, by steel and gas plants, and as a source of coking coal. TKI produced all Turkish bituminous coal and about 70% of the lignite.

Petroleum.—Petroleum production totaled 53,227 barrels per day in 1977 which supplied about 25% of the country's requirements. Turkey also imported crude oil during the year, primarily from Iraq.

Crude oil reserves were estimated at 65 million barrels. Türkiye Petrolleri Anonim Ortakligi (TPAO) (Turkish Petroleum Corp.), a Government company which produced about 25% of the country's oil, continued its extensive exploration program. In 1977, TPAO discovered oil in the southern Diyarbakir region near Tigris. The well tested 1,100 barrels per day from a depth of 8,000 feet. TPAO was also reported to have discovered oil in two wells near Adiyaman on the Syrian border.

The 1,000-kilometer petroleum pipeline linking Turkey and Iraq began operation in 1977. The pipeline extended from Iraq's northern Kirkuk oilfield area to the Turkish port of Dortyol on the Gulf of Iskenderun. By yearend, Turkey's offtake from the pipeline was nearly 200,000 barrels per day or 66% of the pipeline's capacity. The Iraqi Government agreed to increase Turkey's liftings as the capacity of the line is eventually boosted to a maximum of 700,000 barrels per day.

Turkey's four petroleum refineries had a total capacity of 14 million tons of petroleum products per year. TPAO operated refineries at Batman and Izmir. The Izmir refinery was to increase production capacity to 5 million tons per year by 1979. Istanbul Petrol Rafinerisi (IPRAS) was to increase the production capacity of its refinery at Izmit to 13 million tons per year with the construction of two new units.

The Mineral Industry of the U.S.S.R.[1]

By V. V. Strishkov[2]

The U.S.S.R., with a centrally planned economy, is the world's second largest producer of industrial products. It is the leading world producer of iron ore, manganese ore, platinum-group metals, petroleum, steel, potassium salts, asbestos, and cement. It occupies second place, following the United States, in world output of aluminum, lead, natural gas, coal, and phosphate rock; it ranks second, after Canada, in the production of nickel; and is second to the Republic of South Africa in gold and chromium ore output. The U.S.S.R.'s mineral industry has been the major factor in the country's development and continues to be a principal support of the country's strong industrial growth. The country has large reserves and resources of many minerals and its mineral exports make the U.S.S.R. mineral industry a significant factor in the mineral economy of the world.

Compared with 1976 figures, the following increases, in million tons, were reported: raw coal and lignite, 10.0; oil (including condensate), 26; natural gas (billion cubic meters), 25; iron ore, 0.9; pig iron, 2.0; crude steel, 2.0; finished rolled ferrous metals, 0.6; steel pipe, 0.2; mineral fertilizers (Soviet standard), 4.5; and cement, 3.0. Electric power output increased 39 billion kilowatt-hours. Output of many nonferrous, rare, and precious metals, oil refinery and petroleum products, and nonmetallic minerals was also higher than in 1976.

Reportedly, industrial output increased 5.7% (5.6% planned), and its value increased by 30 billion rubles, from 532 billion rubles[3] in 1976 to 562 billion rubles in 1977. National income rose 3.6% (4.1% planned) to 398 billion rubles. Heavy industry (group A) output rose 6.0% (5.9% planned), and consumer goods (group B) production rose 5% (4.9% planned). Investment rose to 122 billion rubles at the planned rate of 3%.

Despite the impressive gains in mineral production, reported in the Soviet press, there have been consistent reports of failures to reach planned goals for several mineral commodities and to supply industrial needs. New goals set for 1976-80 were chiefly to fulfill quantitative targets in the mineral commodities; there were indications that a considerable part of industrial output did not meet Soviet standards of quality.

Goals of the 1977 plan were closely approached in many areas of the mineral industry, as can be seen from the following tabulation:

Commodity	1977 (million tons)	
	Planned	Reported
Iron ore (usable)	243.3	240
Pig iron	110.2	107
Steel, raw	151.1	147
Coal, raw (bituminous, anthracite, and lignite)	733	722
Crude oil (including condensate)	550	546
Natural gas billion cubic meters	342	346
Mineral fertilizers (Soviet standard)	98.5	96.7
Cement	NA	127
Power, electric billion kilowatt-hours	1,160	1,150

NA Not available.

The year 1977 was disappointing in terms of growth for the Soviet economy. Reported industrial growth exceeded the (reduced) plan target, but the key indicator, labor productivity, rose only by 4.1% (planned 5.3%). As in previous years, this shortfall must have been offset by an above-plan

Digitized by Google

increase in the industrial-labor force. Soviet statistics for 1977 performance indicate that the growth rate has not been sufficient to bring the output of coal, iron ore, pig iron, steel, and mineral fertilizers to the levels foreseen for 1980.

The U.S.S.R. Ministry of Ferrous Metallurgy was unable to meet the 1977 plan for production of many types of products. Out of 64 enterprises, 55 were unable to meet the planned quota for rolled steel products in the first half of 1977.[4] Many industrial consumers did not receive many of the products ordered. Insufficient production of high-quality steel for special requirements such as aircraft and nuclear reactors compelled the machine-building industry to use other available products, and the shortage of rolled products forced the import of ordinary steel sections, steel pipe, and special steel from Japan and Western countries.

The Soviet Union's mineral economy continued its steady expansion in 1977 but at a slower rate. Expansion of the mineral industry continued to be achieved mainly through increased input of labor and capital rather than advancing technology. It is estimated that two to three times more investment and labor, in real terms, is required in the U.S.S.R. than in the principal countries of the West to achieve a given increase in mineral output.

With a total population of 260 million (139.1 million women and 120.9 million men) in January 1978 (a growth of 2.1 million in 1977), the Soviet economy employed 106.4 million industrial workers and 14.7 million farmers (Kolkhozniks). In 1977, women accounted for 51% of the labor force in the Soviet economy. Until recently, women represented a major labor reserve, but this reserve has been practically exhausted and the use of other Comecon[5] member nations' labor in the Soviet Union is growing.

Practically all sectors of the mineral industries maintained more production personnel than called for by plan targets. The Soviet ferrous and nonferrous industries employed over 3 million workers;[6] the ferrous industry alone accounted for about 1.4 million "production" workers, 75,000 university graduate engineers, and 125,000 graduate technicians. The Soviet coal industry employed 2,152,700 men and women, including 1.2 million "production" workers, some 0.7 million "nonproduction" workers, 212,800 graduate engineers and technicians, and 27,800 managers and general managers.[7] The coal industry employed 770,000 women, including 109,000 at underground mines.[8] The oil, gas, and petrochemical industries employed 2.6 million, including over 250,000 in the development of oilfields and gasfields.[9] The crude oil extraction industry employed about 740,000 and the gas extraction industry 240,000 persons.[10] The fuel and energy sector of industry employs more than 10% of all workers engaged in industry.[11] The standard workweek in the U.S.S.R. is 41 hours.

There were about 150,000 graduate mining engineers in the Soviet economy in 1975. Of these, 37% were employed in the coal industry, 11% in ferrous metallurgy, 10.5% in nonferrous industry, 3.3% in the construction material industry, 2.7% in the mineral fertilizers industry, and 35.5% in other branches of the national economy.[12] Mining engineers are trained at 38 Soviet institutes.

The piece-rate principle has become an important feature of industry. Soviet labor legislation requires that workers achieve a minimum output within a given period. This minimum is the work norm and is established for virtually every phase of employment. Following the significant increase in output quotas, there has been a substantial increase in the proportion of workers not meeting the increased quotas established during the last 3 years. For some mineral industry enterprises it amounted to 15% and more in 1975.[13]

Although the trade unions in Western countries are principally wage-bargaining organizations, their Soviet counterparts function largely as an avenue for increasing labor productivity and fulfilling planned quotas. The unions operate the insurance system and also work with management on safety. Practically every worker, including the entire management team, belongs to the union.

The administration of Soviet coal mines, with the approval of trade unions, has often used overtime work to fulfill the planned coal production quota; it has sometimes required workers to work two shifts in succession and has even required underground miners to work an 8-hour shift instead of a 6-hour shift, a violation of the labor law.[14]

The U.S.S.R. does not publish comprehensive data on injuries in the mineral industry. Available Soviet information reveals

Digitized by Google

that in 1974 there were fatal injuries at 48% of the Soviet coal mines and at 3% of the metallic mines.[15] For many years, the largest number of accidents occurred at the coal mines of the Ukraine, Kazakhstan, and the Kuznetsk coal basin in Siberia.[16] The number of fatal accidents at development faces of the Ukrainian coal mines was 80% greater in 1974 than in 1969.[17] Accidents at many coal and metallic mines are caused mainly by inadequate ventilation, the low level of equipment repair, and violation of technological processes.[18] The accumulation of dust at work sites in underground mines of the Soviet Union is high and often exceeds the sanitary standard.[19]

The turnover of personnel in mineral industry operations ranged from 25% to 80% per year. This was caused mainly by the delays in building houses and providing public and medical services, by low material incentives, and by heavy manual work and unsafe working conditions.[20] At certain mineral industry operations there are insufficient workers. The shortage of qualified young workers, especially in the eastern regions of the country, was becoming acute. The Soviet press has already expressed serious apprehensions about the capability of the educational system to replace the present labor force at metallurgical enterprises.[21]

At the end of 1977, the Central Committee of the C.P.S.U. and the Council of Ministers of the U.S.S.R. issued a joint Decree "On Further Improvement of Training and Education of Students in High Schools and Their Preparation for Work."[22] The decree called for increasing the time devoted to labor education in the last two grades from 2 to 4 hours a week and arranging for the planned integration in the country's labor force of all high school graduates who do not continue their education. Much of what was proposed in the decree had already been several times attempted and rejected as inefficient.

Soviet statistical agencies do not publish data on the actual earnings of workers in the mineral industry, with the exception of highly paid underground "production workers." The average official monthly income of Soviet workers and employees in 1977 was 155 rubles, compared with 151 rubles in 1976, an increase of 2.6%. In 1977, the raising of the monthly minimum wage from 60 to 70 rubles continued in the North and Soviet Far East and in some European regions of the U.S.S.R. According to Soviet calculations, the minimum family income for satisfactory life is 100 to 150 rubles per person per month.[23]

Government Policies and Programs.—Soviet mineral policy is based on the principle of maximum self-sufficiency at any price. With State-owned and State-operated enterprises, low wage labor and low per capita consumption, the U.S.S.R. has become the most self-sufficient of the world's leading industrial nations. Actual or estimated costs of production in the U.S.S.R. are not a prime factor in the selling price of a commodity on the domestic or international market. The Soviet system permits the establishment of selling prices at any level believed desirable to meet political or economic requirements. Therefore, many mineral ventures in the Soviet Union would be uneconomic by Western standards. Mineral development, as the basis of industrial growth, holds a key place in Soviet economic policy. Very large sums are spent on mineral exploration and production; these funds are distributed over a dozen specialized ministries.

The Soviet mineral economy has been totally planned since 1929. Production goals are established at a very senior level and are formally approved by the Supreme Soviet of the U.S.S.R. There are 5-year plans and 1-year plans; both types of plans set a definite program for all mineral and energy resources. Besides setting national priorities and goals for each industry, the plans are law and carry mandatory obligations.

Relations With Comecon Countries.—Considerable attention is now being devoted to economic "integration" and industrial "cooperation" between the Comecon countries, and this makes East Europe, Mongolia, and Cuba more dependent upon the Soviet mineral industry. Between 1973 and 1975, the Comecon countries prepared and adopted a Synchronized Plan of Multilateral Integration Measures for 1976 and 1980. It covered the construction of joint industrial enterprises in the current 5-year plan, for the period to 1990, and in part to the year 2000.

The construction of the several industrial enterprises included in the Synchronized Plan is linked through Comecon countries on an "equalization" basis; that is, the countries that grant credits receive a corresponding quantity of products. An example is the construction of the Kiyembay as-

Digitized by Google

bestos production complex in Orenburg Oblast', with an annual capacity of 500,000 tons of asbestos. The Comecon countries will supply the U.S.S.R. with raw materials, machines, equipment, and consumer goods. Soviet deliveries of asbestos to the countries participating in the project will amount to about 80,000 tons annually; beginning in 1980, they will run for 12 years. The reserves at the Kiyembay complex are adequate for 40 years.

Construction of the natural gas pipeline from Orenburg to the western border of the U.S.S.R. continued in 1977. It is expected that the European Comecon countries constructing this line will receive 15 billion cubic meters of gas in 1980. The 2,750-kilometer pipeline (1,420 millimeters in diameter) is to operate at 75 atmospheres pressure. Each country builds a segment of the pipeline on its own, with the appropriate number of compressor stations and other items required in the project.

In 1974, the U.S.S.R. and five European Comecon countries signed an agreement for additional iron ore capacities in the area of the Kursk Magnetic Anomaly and in the Ukrainian S.S.R. Under this project agreement the European member-countries were to provide credits to the U.S.S.R. amounting to 675 million rubles during 1974-78. At the same time, these countries concluded an agreement for additional capacities of selected ferroalloys in the U.S.S.R. in the ferroalloy works of Nikopol' (Ukraine) and Yermak (Kazakhstan). The East European countries supply different materials, machines, equipment, and consumer goods for the construction of the facilities. The U.S.S.R. is to deliver iron-containing raw materials and some ferroalloys to participating countries from 1979 through 1990.

In 1976, the U.S.S.R., Cuba, and six European Comecon countries concluded an agreement on the joint construction of nickel and cobalt facilities in Cuba. The Comecon countries were supplying both materials and specialists. A plant with a capacity of 60,000 tons per year nickel and cobalt was to be built, bringing Cuban production to 130,000 tons per year. The largest part was to be shipped to the U.S.S.R. and East European Comecon countries.

A considerable increase in nonferrous metal production was planned in the U.S.S.R. and Mongolia. A project for the construction of a copper smelter in Mongolia (based on the Chagan Suburga mine) and another project (based on the Ugodzir tungsten-molybdenum deposit) were under study. East Germany was assisting in the renovation and expansion of facilities at the Booken Chogt tungsten concentrator in Mongolia.

In June 1976, Bulgaria signed an agreement with the U.S.S.R. for joint development of its nonferrous industry in 1976-80 and beyond. The U.S.S.R. was to aid Bulgaria in the construction and modernization of 14 projects of the nonferrous industry. Construction of facilities for production of bauxite in Hungary, copper and zinc in Poland, and tin and tungsten in Czechoslovakia continued in 1977.

The Comecon countries were assisting in the construction of the potassium mineral fertilizers facility in the U.S.S.R. Some member-countries will participate in the construction of the second stage of the Kingisepp phosphorite complex in Leningrad Oblast' and in the development of the phosphorite basin "Hybsugul" in Mongolia.

The estimated costs of all projects under construction was over 9 billion rubles, only half of this amount being paid by the U.S.S.R. The further integration of economies of member-countries is an objective of the U.S.S.R. in the Comecon.

A plan for the development of a unified inter-Comecon power transmission system called for the creation of a single large power grid by 1990, to tie all the European Comecon countries and Yugoslavia into a single system. The 750-kilovolt line from Vinnitsa (U.S.S.R.) to Albertirsa (Hungary), to supply power to East European countries, was to be built jointly by the U.S.S.R. and Hungary.

The protocol on Yugoslav-Soviet economic and scientific cooperation, signed in October 1977, provides for an additional $210 million Soviet credit to Yugoslavia.

Relations With Developed Countries.—In its economic relations with developed countries, the Soviet Union strives for all-round economic "cooperation." Long-term agreements on developing economic, scientific, technical and industrial cooperation have been signed with the United States, the Federal Republic of Germany, France, Italy, the United Kingdom, Denmark, Austria, the Netherlands, Portugal, and Switzerland, and with many individual companies in the West. These provide for cooperation in the construction of industrial complexes, expansion and modernization of existing

Digitized by Google

industrial enterprises, and research planning.

Soviet law does not permit private ownership of the "means of production," but foreign investors are invited to develop deposits and to construct plants in the U.S.S.R. and repayment is to be made in the form of production from these operations. Thus the Soviet Union is able to bring much needed investment and technology from Western countries by using "joint" or "compensation" venture arrangements. Joint operations are provided in such fields as the chemical industry, the ferrous and nonferrous industries, and the oil, coal, and mineral fertilizer industries. Agreements have been concluded with Western countries for construction of more than 60 large projects in the U.S.S.R. on a compensation basis. The U.S.S.R. needs Western technology to solve many of the problems in the mineral industry. At the same time, Soviet organizations are taking part in the construction of a number of industrial projects in developing countries.

Transition to large-scale cooperation on a long-term basis is a new feature in the U.S.S.R.'s trade and economic relations with many countries; early examples were with France, the Federal Republic of Germany, Italy, Finland, and the United States. Payback agreements have been signed with British firms. These agreements usually provide long-term bank credits to Soviet foreign trade organizations. The Soviet Union uses these credits to buy licenses, equipment, machinery, and materials for the construction of major industry projects. In their turn, the creditor countries, also on a long-term basis (usually 10 to 15 years), purchase in the Soviet Union a part of the finished products produced by these projects and other enterprises. The projects themselves become the property of the Soviet Union. The share of output exported as repayment of the credit usually amounts to 20% to 30%.

Relations With Developing Countries.—The Soviet Union encourages State-managed mineral resource development in the developing countries. The U.S.S.R. sends technicians and makes loans to countries willing to promote State development and distribution of fuels and minerals. Soviet technical assistance and economic aid programs include 426 industrial projects in about 70 countries at a cost of some 5 billion rubles. Soviet specialists provide technical assistance for geological research, prospecting, and exploration in 30 developing countries.

In many instances, developing countries pay for Soviet assistance with mineral commodities. The U.S.S.R. is now able to secure a substantial flow of mineral imports at low cost from friendly developing countries, and there are indications that it intends to extend this pattern to gain exclusive access, for itself and other Comecon countries, to deposits of exceptional quality.

The U.S.S.R. sent more than 6,000 Soviet geological and exploration personnel to more than 30 developing countries and supplied over 650 million rubles worth of prospecting equipment. The Soviet Union is to provide financing for a $300 million aluminum smelter to be built on the Indonesian island of Bintan. Reportedly, a major agreement has been signed for Soviet development of the Meskala phosphate deposit in Morocco, in exchange for Moroccan phosphate rock and triple superphosphate. The phosphate open pit is to begin production in the mid-1980's at a rate of 2 million tons per year, rising to 10 million tons per year by 1990. The Soviets are expected to be taking up to 9 million tons per year by 1990.

According to a Soviet source,[24] the following annual productive capacities had been constructed, were being constructed, or were to be constructed in the developing countries with Soviet assistance, as of January 1, 1977:

	Million tons
Pig iron	15.8
Steel-crude	19.6
Rolled steel products	15.2
Iron ore	14.0
Coal, raw	20.8
Crude oil	53.4
Petroleum products	19.1
Powerplants million kilowatt-hours	11.6

Reportedly, under an agreement signed in September 1977, the Soviet(50%)-Italian (50%) Tecnicon Co. was the first joint venture between a Western concern and a U.S.S.R. State agency. Tecnicon will specialize in the design and construction of steel plants in developing countries.

Projects built or being built in developing countries with Soviet assistance are as follows:

Source: Foreign Trade, Moscow, No. 6, June 1977, pp. 13-14.

During 1977, Soviet theoreticians and practitioners searched intensively for ways of improving the economic system. Statements made by Soviet economists show that the indicator of "realized" production—that is, output accepted and purchased by the consumer—which was introduced during the reform of September 1965, replacing the indicator of gross output (the "val") as a basic indicator of an enterprise's operation, did not meet expectations. The Soviet command economy continued to emphasize quantitative output and "fulfilling the planned targets."

In July 1977, the U.S.S.R. Council of Ministers adopted a decision on providing measures to economize in the use of fuel and energy resources; differentiated norms for the expenditure of fuel and energy per quarter were to be established for enterprises and organizations starting in 1977.

Transfer of Technology.—A leading article in Pravda (December 6, 1977) criticizes the lagging rate of introduction of new technology by Soviet industrial ministries, including ferrous metallurgy, petroleum and petroleum refining, and petrochemical ministries.

Western technology is a key factor that can favorably influence Soviet economic performance. The import of such technology does not resolve many of the contradictions in the Soviet economy, but it does accelerate the industrialization of the country.

the Federal Republic of Germany was the largest Western exporter of equipment and machinery to the U.S.S.R. in 1977. Its involvement included the construction of a gas transportation system in Siberia, deliveries of trucks for the construction of the Baykal-Amur Main Railway, and the construction of the Kama automobile works, Oskol metallurgical complex, and a number of large chemical complexes. The Japanese-Soviet Economic Committee, which was organized in 1965 at the suggestion of the U.S.S.R., plays a major role in developing Siberian natural resources using Japanese capital and know-how. In 1977 the committee was engaged in Southern Yakutia coking coal development, Yakutia natural gas exploration, and Sakhalin continental shelf oil and gas exploration. Reportedly, the Soviet Union offered to supply Japan with enriched uranium in exchange for nuclear-power-generating equipment. The Soviet and Italian Governments agreed on a new 3-year credit of $650 million (in addition to a previous $900 million), to be used for financing turnkey projects.

Digitized by Google

Soviet imports of Western plants and technology related to mineral industry projects fall into several categories: Extraction, transportation, loading and refining of crude oil, and construction of petrochemical and metallurgical complexes.

The Soviet Union is planning to increase oil and gas production to boost foreign exchange earnings, as well as to improve its energy output. For development of these resources, it is turning to Japan, to West Europe, and particularly to the United States and planned to spend several billion dollars during 1976-80 on imports for the petroleum and gas industry alone. Petrobaltic, the joint Baltic offshore exploration company of the U.S.S.R., Poland, and German Democratic Republic, is looking in the West for a rig capable of operating in 700 meters water with drilling capacity up to 5,000 meters. The U.S.S.R. was also interested in the purchase of gas-lift extraction equipment, to be used in the development of Samotlor and Fedorovsk, two of the largest Soviet oilfields in Western Siberia.

Frendi Serete finished construction of a geological survey and coring vessel ordered by the Soviet Union. Negotiations between the U.S.S.R. and British Petroleum concerning foreign assistance in construction of a $150 million oil platform fabrication plant near Baku continued in 1977. The Soviet representatives also discussed this project with other Western firms. The Soviet Mashinoimport awarded a consortium of four Japanese firms a $10 million order for cast-steel valves, to be used in construction of an oil pipeline. The contract called for delivery within 1977. Reportedly, the Italian Pressindustria SpA won a 20,000-million-lire contract from the Soviet Union for a plant to produce 250,000 tons per year of nonionic surfactants, which are used in tertiary oil recovery. The plant was to go onstream in 1980.

A West German banking consortium granted a DM600 million credit to finance the latest Soviet order for 380,000 tons of large-diameter steel pipe from Mannesmann Handel A.G. and Thyssen Stahlunion A.G. The Soviet Union signed a $630 million contract with the Federal Republic of Germany for purchase of 17 compressor installations for use on the Orenburg natural gas pipeline. A new contract worth F130 million was signed between Constructions Metaliques de Provence and Mashinoimport. The French company was to supply equipment for the treatment and processing of gas at a plant in the western Ukraine. Its yearly output of 35 billion cubic meters was to be piped to Western Europe.

Mitsubishi Heavy Industries Ltd. received an order to supply 61 liquefied petroleum gas (LPG) compressors, to be shipped in 1978 and installed at three plants, to be built in the Tyumen' region, Western Siberia, by Japan Steel Works, Ltd., by 1980. Reportedly, Japan's Asahi Chemical Co. signed a contract with Tekhmashimport for delivery of technology for three benzene plants, each with an annual capacity of 120,000 tons, by 1981. Italy's contract to purchase Soviet natural gas was extended from its original 1992 expiration date to the year 2000 in repayment for more oil refinery and petrochemical construction work.

In 1976, Unit Rig signed two agreements for delivery to the U.S.S.R. of eighty-four 180-ton dump trucks worth $119 million. These were to be used in the Nerungra coal open pit in Yakutia.

According to the Finnish-Soviet protocol on the construction of the Kostamush iron ore project, signed in October 1973, a railroad and highway on the Soviet territory have already been built by the Finns from the national border to the Kostamush construction site. Annual mine output at Kostamush will be about 24 million tons of iron ore, from which about 8.9 million tons of iron pellets will be produced annually. The building of the concentration plant is to be carried out in three stages. The first stage is scheduled for completion in 1977-82. After completion of this stage, Finland will buy up to 1.2 million tons of pellets annually in 1983-90.

In 1976, the Pechiney Ugine Kuhlmann (PUK) signed a F1,200 million contract for the French to furnish equipment and assistance in construction of a million-ton alumina plant at Nikolayev on the Black Sea. This was to supply the Sayan aluminum plant near Abakan in Siberia. Specialists from PUK were also helping in the construction of the Sayan. The first potline was to be operational in 1980. PUK was assisting in the construction of the Regar aluminum plant in Tadzhikistan and was also seeking Soviet contracts for a 100,000-ton graphite electrode plant and for a selenium metal facility worth F500 million.

Midrex Corp. concluded a contract between Soviet Metallurgimport and Korf A.G. and Lurgi Chemie and Huettentechnik, the Federal Republic of Germany,

Digitized by Google

for the construction of four Midrex 400 Series Direct Reduction Modules. The four Midrex Modules, with a total annual capacity of 1.7 million tons per year of high-quality iron, were to be constructed within the Oskol iron and steel complex in Belgorod Oblast'. The U.S.S.R. was negotiating with the Western firms on construction of the 100,000-ton-per-year Armansk No. 2 titanium dioxide plant. The contract value was about £100 million. The first Armansk plant, with a capacity of 30,000 tons per year, was built by Tecnimont using technology supplied by its parent, Montedison.

The Soviet Union signed a F340 million contract with Azote et Produits Chimiques and PEC Engineering of France to provide equipment for seven 1,200-ton-per-day liquid ammonia plants. An ammonia plant, with a capacity of 365,000 tons per year, was constructed by Toyo Engineering Corp. at the Nevinnomysk chemical complex. Soviet ammonia, to be delivered to France over a 10-year period starting in 1980, represents compensation for four ammonia plants supplied by Creusot-Loire. Czechoslovakia and Mitsui of Japan were to supply the U.S.S.R. with 10 ammonia plants. Negotiations were underway between the Soviet and Western firms for another ammonia plant, with an annual capacity of 450,000 tons, to be built at Angarsk by 1981.

Reportedly, five complex fertilizer plants, each with a capacity of 1,840 tons per day, were to be built by Toyo Engineering by 1981. Two of the plants were to be located at Novgorod, two at Rossosh (Voronezh Oblast'), and one at Dorogobyzh. Speichim of France has signed a F450 million contract for three 800,000-ton-per-year fertilizer plants scheduled for completion by 1981. The plants were to be located at Novyy Rozdol (Ukraine), at Byelorechensk near Krasnodar, and at Meleuz. France's Rhone-Poulenc has signed a $1,200 million contract with the Soviet Tekhmashimport for two-way trade in equipment for fertilizer plants and chemical products.

Spie Batignolles of France signed an agreement for the construction of nine phosphoric acid units, to be completed by 1980. Coppée-Rust of Belgium signed a $135 million contract with Tekhmashimport to build four phosphoric acid units by 1981; two at Cherepovets, one at Meleuz, and one at Byelorechensk. Société Krebs was to construct a 500-ton-per-day phosphoric acid plant in the Ukraine.

Reportedly, France's PEC-Engineering signed a F140 million contract with Tekhmashimport for the construction of a potassium chloride plant in 1980. A DM3 million contract was signed with GHH Sterkrade, for the supply of loaders, with bucket capacity of 5.6 cubic meters, and spare parts for use in potash mining. In 1975, the company supplied the U.S.S.R. with similar loaders.

The largest contract ever completed between the U.S.S.R. and the United Kingdom was signed in May 1977, when Davy Powergas Ltd. agreed to supply two complete methanol plants at a cost of $250 million. The units were to be built at Gubakha in the Urals and at Tomsk in Siberia. A consortium of companies to be led by Technip signed a $500 million contract with the Soviet Tekhmashimport to build two aromatic complexes, to be located at Ufa in the Urals and at Omsk in Siberia. The complexes were to be completed in 1980-81. According to an agreement, Czechoslovakia was to deliver to the U.S.S.R. three urea production units, each with an annual capacity of 161,000 tons. The units were to be installed at the Cherkassy, Dneprodzerzhinsk, and Grodno fertilizer plants. Poland signed a contract with the Soviet Union for the supply of three sulfuric acid plants. Forty-four sulfuric acid units, with a total capacity of 17 million tons per year, have been ordered from Poland, over half during the 1970-77 period.

Reportedly, British International Computers, Ltd., sold a computer worth £200,000 to the U.S.S.R. The Control Data Corp. sold a Cyber 172 computer system for use in oil and gas exploration offshore Sakhalin Island.

The Plan for 1978.—The State plan for 1978 was ratified by the Supreme Soviet on December 16, 1977. The original target for 1978, set as part of the 1976-80 plan, was reduced, and heavy industry production was to be stressed for the year. Industrial growth was to be 4.5% compared with the average annual rate of 6.5% projected in the tenth 5-year plan in 1977. Heavy industry was to grow by 4.7% (compared with 5.9% projected in 1977) and consumer goods industry by 3.7% (compared with 4.9% planned for 1977). Capital investment was to total 125.5 billion rubles, a 3.4% rise over that of 1977. Major investment areas in 1978 continued to be the fuel energy sector, the ferrous, nonferrous, chemical, and machine construction industries.

Special attention in the 1978 plan (as in 1977) was to be focused on the fuel and

Digitized by Google

power sector. The generation of electric power was to be increased by 4.7% to 1,207 billion kilowatt-hours. The planned production of electric power was in line with the 1980 target of 1,340 to 1,380 billion kilowatt-hours. Because of the continuing fuel crisis and to improve the fuel-energy balance in the European part of the U.S.S.R., special attention was to be given in 1978 to the rapid expansion of nuclear powerplants. It was planned to complete a 1-million-kilowatt unit at the Novovoronezh, Chernobyl, and Kursk nuclear powerplants in 1978.

Crude oil extraction (including condensate) was planned at 575 million tons in 1978, 29 million tons over that of 1977. This goal was in line with the tenth 5-year plan (491 million tons in 1975 and 620 to 640 million tons planned for 1980) and suggested that the peaking of Soviet oil output predicted by some Western experts may occur later than originally expected. The increase in petroleum production in 1978 was to come from Western Siberia. Natural gas output was to amount to 370 billion cubic meters, an increase of 6.5% over that of 1977 and was to come mainly from Western Siberia, Central Asia, and Orenburg Oblast'. The planned output of natural gas was also in line with the 1980 target of 400 to 435 billion cubic meters.

Raw coal and lignite output was to be 746 million tons, 24 million tons over the 1977 level. The main increase was to be from open pit lignite operations in Kazakhstan and Siberia. Increased hard coal production was to be from the Donets, Kuznetsk, and Karaganda basins. The new 1978 target for raw coal and lignite implied that the 1980 goal (790 to 810 million tons) was unlikely to be met.

Raw steel output was to be increased by 5.6 million tons to 152.6 million tons. Compared with the 1977 production, finished ferrous rolled metal output was to be increased by 4.3 million tons to 106.3 million tons. The 1980 target for raw steel (160 to 170 million tons) was unlikely to be met. Steel pipe production was to be increased by 0.7 million tons to 17.7 million tons. It was planned to produce 101.5 million tons (Soviet standard) of mineral fertilizers in 1978, or 4.8 million tons over the 1977 level.

The 1978 nonferrous metallurgy plan called for increased production of aluminum, copper, and nickel. The output of platinum-group metals, gold, and rare and other nonferrous metals was also to be increased. It was planned to increase production of aluminum at the Krasnoyarsk and Regar plants and that of alumina at the Uralsk, Bogoslovsk, and Pavlodar plants. Geological exploration would be concentrated in the regions of established deposits and plants. The 1978 plan provided for a 10% rise in foreign trade. A number of industrial commodities were deleted from the 1978 plan report, including iron ore, pig iron, cement, and sulfuric acid.

Declining reserves of raw materials and fuels in the European part of the country have forced Soviet planners to give increased attention to the northern and eastern areas. Development and exploitation of these reserves will be difficult, however, and the extreme climatic conditions will necessitate large capital investments in railroad and pipelines for long-distance transportation.

The plan stressed that capital is to be channeled, in the first place, towards the technical reequipment of operating enterprises. The plan called for a low growth rate in key sections of the Soviet economy during 1978, including the smallest increase in heavy industrial production since World War II. The low economic goals made it likely that the Soviet Union will fall short of its many 5-year plan targets. The increases in 1977 and those projected for 1978 were below the 5-year planned average, while the index itself was distorted by the existence of covert inflation and the overvaluation of transfer payments.

The lower growth rates for the Soviet economy set for 1978 were indicative of key economic problems: low productivity of labor and equipment, low return on capital investments, hard-currency trade deficit, low recovery of metals from the ores, and misuse of mineral resources. The 1978 plan showed the beginning of a recognition by the Soviet planners that growth at any cost is bad economics. Soviet industrial production in 1977 and plans for 1978 are as follows, in million tons unless otherwise specified:

Exploration.—Over 5,000 deposits of various minerals were being exploited in 1977, and exploration continues on a large scale. There were over 500,000 employees in the geological and prospecting organizations of the U.S.S.R. in 1977, including over 65,000 graduate specialists with university educations and about 55,000 graduate technicians. Over 4 billion rubles was allocated for geological exploration in 1977. Over 2 billion rubles was for oil and gas, and some 200 million rubles was for coal. Over 2,500 geological and geophysical teams are permanently employed in oil and gas exploration, and about 2,200 exploratory wells are completed each year, using some 2,500 drilling rigs. In 1976, the Ministry of Geology did not meet the planned targets for petroleum prospecting.[25] There were 13 plants that supplied prospecting and exploration activities with machinery and equipment.

During 1971-77, exploration of the Talnakh and Oktyabr' copper-nickel and platinum-group metals in Krasnoyarsk Kray was completed, and the reserves were confirmed, enabling the Norilsk complex to expand its production of copper, nickel, cobalt, and platinum-group metals. Exploration of the Gay and Uzel'gin copper-pyrite deposits (in the Urals) and of the Vezhayu-Vorykvin (Timan) and Vislovsk (Kursk Magnetic Anomaly region) bauxite deposits was completed in 1977.

The coking-coal reserves at Neryungra in the South Yakutia Basin have been confirmed. An open pit, with a capacity of 13 million tons per year of raw coal, was under development. In the Kuznetsk Coal Basin, a group of deposits was explored for the development of a number of open pits, and in the Kansk-Achinsk Basin reserves of 3 billion tons lignite were confirmed in the northwestern part of the Aban deposit. The explored iron ore reserves of the Kursk Magnetic Anomaly were increased by 2.3 billion tons, and the Chernyanka deposit in Belgorod Oblast', with reserves of 1 billion tons, was prepared for development. An apatite deposit was discovered at Seligdar in South Yakutia, with reserves of 2 to 2.5 billion tons; this was the first such deposit in the Soviet Far East. Exploration of the vast territory of East Siberia and the Soviet Far East in the region of the Baykal-Amur Main Line (BAM) has been started. In 1977, about 200 teams were prospecting in the vicinity of BAM.

A Japanese firm was participating in geological surveys on the Sakhalin continental shelf under an agreement signed in 1975. The Sakhalin Petroleum Development Co. of Japan, established under the same agreement, has extended a credit to the U.S.S.R. permitting it to borrow a floating rig, special machines, ships, and other equipment needed for the geological surveys. In repayment, the Japanese company will receive Sakhalin oil. A joint Japanese-Soviet exploration has already resulted in an oil discovery on the northernmost tip of Sakhalin Island.

The 1976-80 5-year plan called for a substantial expansion of exploration, particularly in existing mining areas and in little-known regions of the Far North, East Siberia, and the Far East. The Ministry of Geology set the following main directions for prospecting in the Russian Federated Soviet Socialist Republic (R.S.F.S.R.) of the most important minerals in 1976-80:

Digitized by Google

Oil and Gas.—Prospecting and exploration will be continued in the European North, and work in West Siberia is being intensified. Exploration continues in East Siberia to assess the prospects of this new gas-bearing region. The area near the Caspian Lowland is being studied, and work on a study of the offshore potential is being expanded.

Solid Fossil Fuels.—Prospecting and exploration is continuing in the European part of the R.S.F.S.R. to expand reserves of coking coal in the Pechora Basin, of anthracite in the Donets Basin, and of power-generation lignite in the Moscow Basin. In Siberia, exploration for coking coal in the Kuznetsk Basin and the South Yakutia Basin is at hand; in the Kansk-Achinsk lignite basin several open pits are being prepared for development.

Ferrous Metals.—Exploration is primarily to provide iron ore reserves for existing operations in the Northwest, the Central region, the Urals, and Siberia and for the preparation of new open pit operations in the KMA area.

In the Northeast region, exploration continues on ferrous quartzites and compound apatite-magnetite ores at the Olenogorsk and Kovdor mining complexes and at the Kostomush complex; in the South Urals work is being conducted on the magnetite deposits of the Tagil-Kushva iron ore region. To strengthen ore reserves for the West Siberian metallurgical complex, prospecting continues at Gornaya Shoriya, at Kuznetskiy Altau, and in the western Sayan Mountains. Simultaneously, prospecting is being expanded in the Angara and Aldan iron ore regions with a view to creating the raw materials base for new enterprises in the eastern regions. An appraisal program is being conducted at the promising manganese deposit at Porozhinskoye on the Yenisey Ridge and at a number of iron ore discoveries in the Trans-Baykal and Uda-Selemdzha regions. Prospecting for chromite ore is being conducted in the Arctic Urals.

Nonferrous Metals.—Prospecting for bauxite in the North Urals and Belgorod regions has been intensified. Promising areas of the Angara and the Altay-Sayan regions and other areas in Siberia are being examined. Prospecting is also being expanded in West and East Siberia for nepheline syenites and alunites.

To expand known copper reserves and to prepare new areas, prospecting for copper-pyrite ores has been intensified in the Urals. Exploration of Udokan deposit and adjacent regions is being expanded.

Lead and zinc exploration is aimed at strengthening the raw material base for existing operations in the North Caucasus, Altay, Baykal, and Primorsk regions. In Uzbekistan, exploration of the Sarycheku, Kalmakyr, and Dal'noye copper and Khandizin lead-zinc deposits continued in 1977. Prospecting for lead and zinc continues on the BAM route, where the Gorevskoye, Ozernoye, Kholodninskoye, and Sardana deposits have already been found.

The bulk of the prospecting and exploration for tin is being conducted within the tin-bearing zones of the Pacific Ocean folded belt and in the existing mining regions. Prospecting for the evaluation of tin-bearing areas—the Pyrkakayskoye, Telekayskoye, Pestrinskoye, and Odinokoye in the Northeast and at Khabarov Kray—will continue.

Mercury and antimony prospecting is planned mainly in the areas of existing enterprises in West Siberia, East Siberia, and the Yakutsk A.S.S.R. Simultaneously, exploration of the richest deposits of the Tamvatneyskoye, Zvezdochka, and Sentachanskoye areas in the Northeast is to be completed. The Yakhtons tungsten deposit has been developed for exploitation.

Nonmetallic Minerals.—Exploration of the deep levels of the Khibiny apatite deposit is to be conducted, and a study is to be made of the Seligdorsk Massif in the Aldan Mountains and of phosphorites at the Vyatka-Kama deposit. Prospecting for potash salts in the Volga-Urals region is to be continued, and prospecting has started at the Nepskiy dome of Irkutsk Oblast'.

The Ukraine contains 82% of the Soviet total explored reserves of manganese ores, 33% of iron ores, 29% of hard coal, and about 28% of coking coal.

The performance of geologists is measured not in the number of deposits explored, but in the footage of drilled holes and drifts—a fact that encourages the drilling of many shallow holes rather than the more time-consuming deep holes. As a result, in many cases, there are discrepancies in quantitative and qualitative indices between exploration reports and actual conditions of deposits. For example, actual indices of the Turgay bauxite and Sayansk copper deposits in Kazakhstan are different than those reported by geologists.[26]

Construction.—The U.S.S.R. continued to

Digitized by Google

experience difficulties completing mineral industry projects on schedule because of shortages of material, equipment, and labor, and organizational problems. Construction of new projects remained slow, and expensive, and was frequently dispersed over a large number of projects. The work took two to three times as long as specified by the U.S.S.R. State Construction Committee. The 10- to 15-year period required to develop a mine with a capacity of 1 to 2 million tons per year contributed to disparities between the capacities of mines, mills, and metallurgical plants. The number of incompleted projects in the construction industry rose considerably in 1965-75; in 1965, only 1.7% of the total planned construction projects were not completed, but in 1975 the figure had risen to 40.8%.[27]

The plan calls for a certain amount of construction in a certain period, with goals expressed in terms of their ruble value. So the enterprises use more expensive equipment and materials than are needed. This is advantageous both to the construction workers and to industry, but the economy suffers large losses. The construction industry suffers particularly from deliveries. "It is no secret that idling in construction frequently amounts to 20% or more of the working time because of disruptions in the material supplies and other reasons," wrote Prof. D.V. Volovoy in a three-part series.[28]

Construction in industry is carried out mainly by the contracting method (80% of all the construction and installation work). The principal constructor in the nonferrous industry is the U.S.S.R. Ministry of Construction of Heavy Industry Enterprises (Mintyazhstroy). Its organizations also construct enterprises for ferrous and coal industries. The U.S.S.R. Ministry of Industrial Construction also does a large amount of constructing work (primarily enterprises for the chemical and petroleum refining industry). The average Soviet-planned cost of a 0.5-million-ton-per-year lead-zinc underground mine was 20.9 million rubles. The average planned cost of a Soviet lead-zinc plant, with an annual capacity of 60,000 tons of lead and 70,000 tons of zinc, was 156 million rubles.[29]

In 1977, the capital construction emphasis was on expansion and renovation of existing enterprises rather than on new construction. Special attention was devoted to the construction of the Nikolayev alumina plant, the Regar and Sayan aluminum plants, the Nadezhda copper and nickel plants in Norilsk, the facilities at the Almalyk complex, and generally increasing capacities of the petroleum, natural gas, and petrochemical industries.

New enterprises that became operational in the iron and steel industry included an oxygen converter complex at the Azovstal' plant and a rolling mill at the Nizhniy Tagil complex. Big capacities were started at the Bogatyr' lignite open pit in Kazakh U.S.S.R. In the mineral fertilizer industry, new capacities included facilities at the Balakovo chemical plant and at the Ionava nitrogen fertilizer plant. New capacities were commissioned at existing enterprises for production of zinc, aluminum, titanium, and rolled nonferrous metals.

Construction of the BAM railway continued in 1977. There were about 60,000 people working on this railway. Once BAM is completed, about 1982, the emphasis is to be transferred to the railway linking BAM with Yakutsk. The Yakut A.S.S.R. is planned to become a major mineral producer during the 1980's.

A decision was made to stop construction of the Razdan mining and chemical complex in Armenia, designed for alumina production from nepheline.[30] This project had been under construction since 1967 and was scheduled to be the second largest (after Achinsk) alumina from nepheline producer.

In 1978, it was planned to complete facilities for generating 11.9 million kilowatts of electric power, and for producing 23.7 million tons of raw coal and lignite, 15.9 million tons (Soviet standard) of mineral fertilizers, 23.4 million tons of crude iron ore, 2.2 million tons of pig iron, and 2.33 million tons of raw steel. The following tabulation gives data reported on additional production facilities, in million tons unless otherwise specified:

Digitized by Google

Commodity[1]	1975	1976	1977	1978 (planned)
Iron ore, crude	27.3	45.0	14.1	23.4

NA Not available.
[1]Includes new or expanded plant and renovation of existing facilities.

Mineral Production.—Soviet industry is organized into ministries, each controlling one sector of the economy throughout the U.S.S.R. The operation of these ministries is in turn controlled by the U.S.S.R. Council of Ministers and State Planning Committee (Gosplan U.S.S.R.).

These two bodies establish production tasks and allocate investment within the limits of the overall plans drawn by the Politburo of the Communist Party of the U.S.S.R. Mineral production of the Soviet Union is entrusted to 13 all-Union specialized ministries and 1 Committee as follows: Coal industry, ferrous metallurgy, nonferrous metallurgy, crude oil production, gas industry, geology, construction materials industry, chemical industry, petroleum and petrochemical industry, power and electrification, construction of heavy industry enterprises, construction of crude oil and gas industry enterprises, land reclamation and water resources, and State Committee for supervision of safe working practices in industry and for mine supervision.

A Soviet decree of April 1956 classified all data on production capacity and production plans of nonferrous, precious and rare metals, and some nonmetallics as State secrets. However, although the U.S.S.R. does not publish official statistics on many mineral commodities, information is available on most. Together with published information on industrial development, this information provides a basis for estimating the output of other commodities. The increase in Soviet mineral production in 1977 was largely due to additional capacity and labor rather than to productivity gains.

During 1966-75, output of aluminum grew by 120%, titanium by 150%, nickel by 94%, silicon by almost 470%, germanium by 130%, rolled copper and nickel products by 170%, and aluminum foil by 120%. Annual ore and rock mining in the nonferrous industry increased from 1,300 million tons to 2,100 million tons during the decade. The proportion of surface mining grew from 60% to 65%. The volume of nonferrous ore processing at concentration plants increased by 50% during the 1966-75 period. In 1976, 71% of the lead and 63.3% of the zinc were produced with the use of oxygen.

In 1977, nonferrous industry enterprises produced more than 70 elements and about 700 different types of industrial products. Almost all silver, bismuth, and platinum-group metals; over 20% of gold; about 30% of sulfur; and up to 10% of zinc, lead, and copper were produced as byproducts. In the surface mining of ferrous and nonferrous ores, excavations were reaching depths of 150 to 200 meters and were becoming deeper at the rate of 10 to 15 meters each year. The average depth of underground coal mining increased from 320 meters in 1965 to 410 meters in 1975, and it is increasing by 9 meters annually.

The Asian part of the U.S.S.R. (east of the Urals) provides about 45% of the total Soviet coal and lignite output, more than 35% of the crude oil, and over 30% of the electric power. The R.S.F.S.R. continues to rank first among the 15 Soviet Republics in mineral production. It produces over 80% of the gold and silver; practically all of the platinum-group metals; more than 80% of the petroleum; about two-thirds of phosphate ores and electric power; over 50% of pig iron, steel, and rolled ferrous products; and roughly 50% of the coal and natural gas.

The Ukraine continues to rank first in the output of coking coal, manganese, and iron ores, and second in natural gas. The Urals economic region, with only 3.2% of the Soviet Union's territory, accounts for one-third of the total Soviet pig iron output, 40% of steel and steel pipes, and over half of potassium fertilizers. There are 41 mines

Digitized by Google

and 6 open pits of the nonferrous industry in the Urals. The Asian Republic of Kazakhstan, one of the most important base metal producing areas in the U.S.S.R., occupies third place in the Soviet mineral production and is the nation's leading producer of chromite, copper, lead and zinc, and rare metals. The Urals-Volga region produced nearly half of the nation's 1977 crude oil output; however, most of the U.S.S.R.'s increased petroleum production was derived from Western Siberia.

There are tremendous losses in the Soviet economy, which ought to be divided in two groups: Production losses, lowering the effectiveness of manufacture of goods; and nonproductive losses, lowering the consumption effectiveness of already manufactured goods. Soviet production losses, in turn, should be divided in two subgroups: "labor" and "material."[31]

Referred to "labor"' losses are losses of work time, including absence from work without reason, whole-day work stoppage, and idle time within the shifts.

There are three types of "material" losses: losses from defective goods, from unutilized raw materials, and from idle equipment. Many enterprises are producing goods with deviations from GOST's (All-Union State Standard) and technical specifications. At a number of enterprises there are very high percentages of wasted materials. This waste is especially high in the metal-processing industry because of the ineffective use of metal and obsolete equipment. The losses caused by idle equipment are expressed in unfinished products and also in underused capacities. Much of the idle time is due to untimely repairs and absence of spare parts. For these reasons, production technology is often disturbed, the share of manual labor grows, and the efficiency of mineral production drops.

A second group of losses is unproductive losses; that is, losses of already-manufactured products. These losses are composed of different elements, including losses in procurement and supply and protection of "unsalable goods," which do not correspond to consumer demand.

Production suffers great losses from labor turnover. Discrepancies in planning and organization are also a source of losses in the mineral industry. A great deal of time is spent on shipping and transportation and on various everyday services.

In the first half of 1977, the plan of shipments of rolled steel products in tons was fulfilled by 99.4%, but the plan was not met for 31 of the 46 products. The Cherepovets plant, for example, undershipped 323,000 tons; the Karaganda complex, 239,000 tons; the Orsk Khalilovo complex, 115,000 tons; and the Krivoy Rog plant, 130,000 tons. The disruptions of contractual obligations created pressure in material and technical supply of construction projects.[33] The Karaganda and Orsk-Khalilovo iron and steel complexes, the Zhdanov Il'ich plant, and the Kommunar and several other metallurgical plants operated poorly for a long period of time. A large number of iron and steel enterprises overspend considerable consumption per unit of production of pig iron, metal scrap, steel casting, and coke.[34] Because of poor engineering service, the coal mines do not meet production quotas.[35]

A number of nonferrous enterprises in Kazakhstan did not meet the 1976 planned targets for exploration, mine development, stripping of overburden, and permissible losses of ores in mining. Therefore, such large enterprises as the Leninogorsk and Irtysh polymetallic complexes did not produce the planned amount of copper, lead, and zinc in concentrates. Due to unsatisfactory utilization of mining equipment, and poor organization of labor and production, the plan for surface mining was not fulfilled by the Sayak and Severo-Dzhezkazgan open pits in Kazakhstan and by the open pit of the Uchaly complex in the Urals.[36]

In 1976, at the underground mines of many enterprises, including the Leninogorsk, Irtysh, and Almalyk polymetallic complexes and the Zyranov lead complex, self-propelled equipment was used poorly. As a result of the irregular and uncoordinated work of mines and concentrators, as well as violation of technological process, many beneficiation plants did not meet planned targets on extraction and allowed losses of nonferrous metals. The Alaverdy complex in Armenia operated unsatisfactorily. Labor and technological discipline was very poor, and high losses of metals were permitted. Performance of the Chimkent lead plant in Kazakhstan was the lowest in the industry. The slag processing facilities at this plant were used only 55% of the working time.[37]

Many enterprises did not operate up to their planned capacities; Achinsk alumina plant, the Revda and Orsk plants for processing nonferrous metals, and the Pol-

Digitized by Google

evskiy cryolite plant were the lowest in the nonferrous industry. Some enterprises do not observe schedules for preventive maintenance, technical servicing of equipment is poor, and rules for technical operation of units and machines are violated and lead to accidents and idle time.[38]

In 1976, many enterprises did not fulfill the goals on production costs and exceeded norms for material, power, and labor expenditures. For example, the Revda plant for processing nonferrous metals paid a fine of 334,000 rubles for not delivering finished products according to the plan, and the Balkhash complex paid a fine of 946,000 rubles for the same reason. Many enterprises did not fulfill their goals on raising labor productivity, and at some enterprises of nonferrous industry the level of labor productivity was reduced. The Solnechnyy tin complex, the Dzhezkazgan polymetallic complex, and the Donetsk nonferrous metals processing plant employed more industrial production personnel than called for by the plan.[39]

In the last three years, the Soyuzvtortsvetmet (secondary nonferrous) enterprises did not fulfill targets on extraction of secondary aluminum. The greatest losses of metals are being allowed by the Mtsensk and Sukhodol'sk secondary nonferrous metal plants and the Gor'kiy, Tashkent, Odessa, and Perm procurement administrations of the Vtortsvetmet. Due to the insufficient work of the Soyuzvtortsvetmet on sorting and finishing copper-containing scrap and tailings necessary for the production of brass rolled products, enterprises of the Soyuztsvetmetobtabotka (processing of nonferrous metals) must use more primary copper and zinc every year.[40]

Transfer of Western technology to the Soviet Union is the most important factor in Soviet mineral industry development. Equipment used in the Soviet mineral industry is standard and mostly of the type made earlier in Western Europe and in the United States. The manufacturing of mineral industry equipment has increased substantially, but the technical standards and the quality of the equipment have fallen short of planned goals. Equipment manufacturing plants have been criticized in the Soviet press for the poor quality of their products.[41] Some enterprises produce only products that are "profitable" for them and pay little attention to the needs of the consumers.[42]

Soviet investigations show that mineral industry equipment is utilized at an average rate of 40% to 45% while the plan calls for 65%. This means that between 55% and 60% of the machinery and equipment is idle. As a result, for example, the coal industry is losing more than 180 million rubles per year.[43] At the open pits of the Ministry of Ferrous Metallurgy U.S.S.R., trucks are idle at an average of 730 units each day.[44] Performance of large imported rotary excavators at the Exibastuz coal open pits in Kazakhstan is poor.[45] The trucks at the Karatau phosphorite open pits in Kazakhstan are used at an average 25% to 37%.[46] The situation is made worse by the fact that generally mineral industry enterprises are not responsible for the low level of equipment utilization, because of the shortage of spare parts,[47] and are not much interested in improving the situation.[48]

The production of mining equipment, especially for mechanizing auxiliary processes, proceeds slowly, according to Soviet press reports, and spare parts output for mining machinery is inadequate. The available machinery did not supplant manual labor at mines. The work performed manually comprises 60% at production faces, 57% in development, and 100% in repair of workings.[49]

Because of a shortage of some needed equipment, there was a rapid increase in stocks at many establishments. Data provided by various ministries have shown that reserves of equipment above the planned limits on construction sites are not diminishing but are actually increasing. At the beginning of 1976 above-plan, uninstalled equipment constituted 36% of equipment as a whole. Much the same applied to equipment bought abroad. During the last 5 years, the value of uninstalled imported equipment has increased to 2.1 billion rubles.[50] Stocks at Soviet nonferrous industrial enterprises reached 108.4 million rubles, including 3.5 million rubles above the planned limits. Many types of equipment are unused for 10 or more years. The quality of the equipment and machines has deteriorated. At the same time, many projects could not be completed because of a shortage of equipment.[51]

In 1977, a number of mines and plants were commissioned despite numerous imperfections and inadequate equipment. Many projects have operated over a long period with lower capacities than originally planned. For example, of all the iron and steel production facilities put into operation

Digitized by Google

in 1960 or later, 49.2% had not achieved planned indices for output, 58.6% had not reached the planned number of workers and personnel staff, 59.7% had not reached the planned level of labor productivity, and 85.3% had not reached the expected level of production costs.[52]

The large number of workers required to operate new facilities is largely connected with the inefficient development of plans for production, mechanization, and automation, the incorporation of machines and assemblies that have not yet been tested in the course of normal operations, and the incomplete planning of mechanization and automation during the construction process.[53]

The significant underutilization of capacity has also been caused by the shortage of raw materials, by the discrepancy of capacity, and by the incomplete development of production. For example, for pig iron, a shortage has been felt of sinter, pellets, and oxygen; for mineral fertilizers, ammonia, phosphorus raw materials, sulfuric acid, and potassium ores have been in short supply.[54]

The Soviets are increasingly conscious of the age and obsolescence of their machine tools and of much of their mining and metallurgical machines and equipment. Soviet industries continue to turn out obsolete models because the emphasis is on production and no time adjustments are made for retooling. The Soviets prefer not to use new and untried equipment with its inherent risk of failure and are inclined to use old and established equipment. In pig iron production, for example, 23% of the industrial production personnel are working with wornout equipment, while the figure is 43% in steel smelting and 42% in rolled steel production.[55]

Arctic Minerals.—The U.S.S.R. extracts vastly greater quantities of Arctic mineral resources than any other country. Deposits of national importance include platinum-group metals, gold, diamonds, tin, nickel, copper, cobalt, rare metals, apatite, and coal. Although mining within permafrost areas is costly, the Soviets are willing to develop these regions in order to achieve greater mineral self-sufficiency and to increase exports of these commodities.

Eastern Siberia and the Soviet Far East hold tremendous stores of useful minerals, ranging from diamonds through metals to coal. Norilsk in Krasnoyarsk Kray is the most important mineral center in the Soviet Arctic. This expanding mining and metallurgical complex, containing four underground and two open pit polymetallic mines and several coal mines as well as beneficiation and several metallurgical plants, yields about three-quarters of the platinum-group metals and more than one-half of the nickel produced in the U.S.S.R. Together with the Kola Peninsula, it contains more than 95% of the Soviet Union's platinum-group metal reserves and 80% of the nickel reserves. Platinum-group metals, cobalt, silver, selenium, tellurium, and other minor metals are recovered as byproducts from the sulfur-copper-nickel ores.

Eastern Siberia, the Yakut A.S.S.R., and the Soviet Far East contain numerous mining sites. Magadan Oblast' is the main gold production center in the U.S.S.R. with 32 placer mines, 22 dredges, and over 500 sand-washing rigs. In Yakutia, the second largest gold-producing region, the Lenzoloto trust is the leading gold-dredging enterprise in the Soviet Union. The Yakut A.S.S.R. also supplies over 90% of Soviet diamonds from the Mirnyy, Akhal, and Udachnyy deposits.

Eastern Siberia, the Yakut A.S.S.R., and the Soviet Far East also account for more than one-third of the total Soviet tin production. Tin is mined at Iul'tin, Omsukchan, and Ege-khayya, with the main center at Pevek. Tin is also produced at Deputatskiy. Several mercury and tungsten deposits have been developed in Magadan Oblast' and in the Chukotka Peninsula.

The Kola Peninsula in the European North of the U.S.S.R. contains the world's largest apatite-nepheline deposit at Khibiny. Reserves are estimated at 2,917,000 million tons of apatite (average grade about 18% P_2O_5), including some 500 million tons of proved reserves. The apatite complex produces 16 million tons of concentrate (39.4% P_2O_5) annually. Kola apatite concentrates provide over 70% of all raw materials for the production of Soviet phosphate fertilizers.

Two nonferrous metallurgical centers function in the Kola Peninsula: The Severonikel' complex, utilizing the copper-nickel ores of the Monchegorsk deposits; and the Pechenganikel' complex, based on four small copper-nickel deposits. Platinum-group metals, cobalt, silver, and a variety of other metals are produced at these complexes as byproducts. The Kola Peninsula also possesses many of the rare metals, mica, and nepheline.

Iron ore is produced at the Olenegorsk

Digitized by Google

and Kovdor complexes. Combined output from two plants reached 10 million tons of concentrate in 1977. The Kostamush iron ore project, which is being constructed jointly with Finland, will produce over 8 million tons of pellets from 24 million tons of iron ore. The first stage of this complex is scheduled for completion in 1982. Mica is also mined in the Kola region.

The Pechora Basin, centered on Vorkuta and Inta, is the second most important coal basin in the European part of the U.S.S.R. The basin produces about 25 million tons of coal per year, including 16 million tons of coking coal. The northern part of West Siberia contains vast reserves of natural gas and crude oil and will be the main Soviet center for production of these commodities in the future.

Mineral Transportation.—About two-thirds of the total tonnage of mineral industry products moved in the U.S.S.R. in 1977 was shipped by rail. The average distances of railroad deliveries in 1976 follow: Coal and lignite, 698 kilometers; crude oil and petroleum products, 1,242 kilometers; iron and manganese ores, 715 kilometers; nonferrous ores, 895 kilometers; ferrous metals, 1,413 kilometers; cement, 512 kilometers; and mineral fertilizers, 1,059 kilometers.

About one-half of the total tonnage of crude oil and refinery products moved in the U.S.S.R. in 1976 was shipped by rail. The total length of crude oil and petroleum products trunk pipelines was 58,600 kilometers at the beginning of 1977, and the average distance of pipeline deliveries in 1976 was about 1,170 kilometers. About 70% of total pipeline capacity was utilized. The total length of trunk gas pipelines in January 1977 was 103,500 kilometers. The U.S.S.R. has several large ports for international shipping on the Black and Baltic Seas. A large port is under construction on the Sea of Japan.

The U.S.S.R. has the sixth largest merchant fleet in the world and the largest number of general cargo vessels. The systematic large-scale undercutting of prices by the growing Soviet cargo fleets is putting in jeopardy the continued existence of the regular services run by Western shipping lines. The need for hard currency will tempt the State-run Soviet fleet to resort to even more slashing of cargo rates. Soviet maritime fleet performance was expected to increase by more than 22% during the 1976-80 period. An increase of 5 million deadweight tons (dwt) in fleet capacity was planned for the same period, involving retirement of 1.6 million dwt and resulting in a net increase of 3.4 million dwt.

No country in the world has such volumes of transport by rail as the U.S.S.R., which "with a span of railway equivalent to 11% of the total world rail network accounts for 53% of the total world freight turnover carried by rail."[56] With an overall length of 138,500 kilometers, Soviet railways carry about 3,300 million tons annually. In 1976, freight turnover in the U.S.S.R. reached 3,295,400 million ton-kilometers; in the United States (where total rail network is more than double that of the Soviet Union) the comparable figure was only 1,200,000 million ton-kilometers.

The intensive use of Soviet railways is related to some extent to the inefficient use of the system. An article published in Gudok[57] reports that diesel fuel is transported both from Kremenchug to Kiyev and in the opposite direction from Polotsk to the Donbass. The Mozyr oil refinery sends gasoline to the Baltic area and to Kaliningrad Oblast', while the Polotsk oil refinery, which is located much closer to these recipients, sends the same quality gasoline to the southwestern Ukraine. There are many other examples.

The transport of petroleum products is also complicated by the distribution of oil refineries and the manner in which decisions are made with respect to their specialized functions. Miscalculations have led to a situation where kerosine is shipped from Ryazan' to Moscow while gasoline is transported from Moscow and Yaroslavl to Ryazan'. Diesel fuel from Kuybyshev is shipped westward, but such fuel is also transported from the west to the Crimea. In 1969-71, a pipeline was laid from Guryev to Kuybyshev, but 3 years later it was decided to lay another pipeline from Kuybyshev to Tikhoretsk (in the Caucasus) and to pump the petroleum in the opposite direction.

Over 38% of all petroleum products are transported by rail in the U.S.S.R., in the United States the comparable figure is 1.5%. According to Soviet data, the situation in other branches of the Soviet economy (particularly the mineral industry) is not much better. This helps to explain the astronomical ton-kilometer rail transport statistics of the U.S.S.R.

The coal-carrying railroads are supplied extremely irregularly with gondolas.[58]

eEstimate. pPreliminary. rRevised.

[1]Estimate unless otherwise noted.

[2]Sources (except where otherwise noted): United Nations Economic Commission for Europe, Annual Bulletin of Steel Statistics for Europe 1977, v. 5, New York 1978, p. 21; Quarterly Bulletin of Steel Statistics for Europe, v. 29, No. 4, 1979, pp. 19, 29.

[3]Estimates for 1976 and 1977 are based upon reported results for the first 6 months of 1976.

[4]Items reported under this heading are produced from semimanufactures listed above and possibly also from similar imported semimanufactures. Therefore, these data are not additive to total semimanufactures listed.

[5]Reported in Soviet sources.

[6]Run-of-mine coal: the average ash content of coal shipped from mines was 20.2%, and the average calorific value was a little more than 5,000 kilocalories per kilogram (9,000 Btu/lb) in 1977.

[7]United Nations. World Energy Supplies 1973-1978. Series J, No. 22, New York, 1979, p. 125.

[8]Not distributed by type, and therefore not suitable for conversion to volumetric units. Data include all energy products, some nonenergy products, and refinery fuel but exclude petrochemical feedstocks, paraffin, petroleum coke, white spirit, unspecified minor nonenergy products, and refinery losses.

[9]United Nations. World Energy Supplies 1973-78. Series J, No. 22, New York, 1979, p. K48.

TRADE

Foreign trade is administered by the Foreign Trade Ministry, operating through more than 60 subsidiary organizations. Political objectives exert a strong and often determining influence. Trade continues to be oriented towards imports of large quantities of Western industrial machinery and technology, including complete industrial plants. Also important are the substantial grain imports. Exports of mineral commodities help pay for these imports, even though there are domestic shortages in almost all mineral commodities exported.

Reportedly, the Soviet Union is making changes in its foreign trade system to make organizations responsible to industrial ministries rather than just to the Foreign Trade Ministry. The amount of statistical data published on the Soviet economy has tended to diminish, for example, the Foreign Trade Statistical Yearbook for 1976 has no data on trade of many nonferrous metals and some nonmetallic minerals.

In recent years, the Soviet Union has moved into a substantial trade deficit with the industrialized West. This has been financed by overseas borrowing (estimated at about $7 billion in 1977). France, Britain, and Italy have all supplied the U.S.S.R. with general credit lines in the past. Predictions are that Soviet credit obligation could reach more than $10 billion by 1980, and some experts suggest that the U.S.S.R. could have trouble meeting these obligations at that time. About 80% of the foreign exchange needs are covered by exports of fuels, metals, and nonmetallic minerals.

Soviet official foreign trade turnover (exports and imports) in 1977 reached 63.4 billion rubles, an increase for the year of 6.6 billion rubles, or 11.6%. The increase reflected mainly higher prices. Whereas in 1976 official import was greater than export by 700 million rubles, the balance became positive in 1977. Export exceeded import by more than 3 billion rubles, so that the net

Digitized by Google

result for the 2 years is a positive balance of more than 2.4 billion rubles. The Soviet Union trades with 118 countries, and in 92 cases the trade is based on intergovernmental agreements. The trade continues to be oriented towards imports of large quantities of Western industrial machinery and technology (including complete industrial plants), food stuffs and raw materials for their production, manufactured consumer goods, ores, metals, and chemicals. Machinery and equipment occupy the leading place in Soviet imports and represent about 40% of the total official import.

Soviet trade with the industrially developed countries decreased slightly in 1977, primarily owing to a large reduction in grain imports. Trade with these countries totaled $27.1 billion, almost the same as in 1976; however, this was 29% of the country's total foreign trade compared with 33% in 1976.

In Soviet economic relations with the industrially developed countries, the Soviet Union prefers the development of trade on a compensation basis, in which the Western companies accept payment in production or in kind, rather than in currency.

According to Soviet sources, the U.S.S.R. had concluded compensation agreements with Western and Japanese companies to supply equipment for construction of more than 60 major projects in such industries as chemical, coal, petroleum, gas, and timber.

The Soviet Union's foreign trade with developing countries rose from $9.57 billion in 1976 to $12.17 billion in 1977. Trade with these countries accounted for 13% of total Soviet trade compared with 11.6% in 1976. Exports to developing countries in 1977 amounted to $7.8 billion.

The largest volume of Soviet trade continues to be with the Federal Republic of Germany, followed by Japan, the United States, and Finland. Foreign trade shipments amounted to 371.5 million tons in 1976; by 1980, they were expected to be 500 million tons. Soviet official foreign trade turnover (exports plus imports) was expected to reach a value of 70 billion rubles in 1980. Most of the Soviet mineral trade has been with nonmarket economy countries, but the U.S.S.R. is now aiming to increase exports to Western countries and especially to the United States. The number of Soviet-controlled firms in the West continues to grow, mostly in marketing, shipping, and fishing. In Vienna, a new joint Soviet-Austrian trading company, Intercom, was established in 1977 to trade in raw materials, mainly ores, coal, and chemical products.

The Soviet Union provides nearly 100% of the other Comecon countries' imports of crude oil, natural gas, pig iron, and electric power; up to 90% of their iron ore; two-thirds of their petroleum products, rolled ferrous metals, and phosphorus fertilizers; and 60% of their coal and manganese ore.

Imports of mineral commodities in which the U.S.S.R. was not self-sufficient in 1977 included ferrous semimanufactures, steel pipe, bauxite and alumina, tin, tungsten concentrates, and high-quality talc and mica. The U.S.S.R. will be importing 70,000 tons of lead ore and 75,000 tons of zinc ore from Iran through 1980. Petroleum and natural gas imports came from the Middle East and North Africa in exchange for manufactured goods and services.

Table 2.—U.S.S.R.: Exports of mineral commodities[1]

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Bauxite	r297	5,282	All to Spain.
Metal including alloys:			
Scrap	r23,368	46,067	United States 29,394; Austria 10,709; United Kingdom 5,781.
Unwrought[2]	[3]502,365	356,458	Hungary 124,887; Czechoslovakia 78,000; Japan 68,760; Yugoslavia 29,185.
Semimanufactures[2]	[3]101,510	9,917	Yugoslavia 4,416; Poland 2,525; Finland 1,447.
Arsenic, acid	--	55	All to Yugoslavia.
Chromium:			
Chromite[3] thousand tons	1,171	975	West Germany 147; Sweden 138; Poland 121; United States 118.
Trioxide	r [3]5,247	[3]6,155	West Germany 1,018; France 970; Japan 825; Czechoslovakia 500[3].

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Copper:			
Copper sulfate[3]	20,361	21,544	Bulgaria 8,600; Hungary 3,080; Switzerland 2,650.
Metal including alloys:			
Scrap	r767	103	All to United Kingdom.
Unwrought[2]	209,859	101,136	Czechoslovakia 41,000; West Germany 23,582; United Kingdom 9,026.
Semimanufactures[2]	17,683	3,876	Yugoslavia 1,972; Poland 1864.
Iron and steel:			
Ore and concentrate[3] thousand tons	43,626	43,126	Czechoslovakia 12,755; Poland 11,828; Romania 5,135; Hungary 4,126.
Metal:			
Scrap[3] do	1,139	1,837	East Germany 511; Italy 349; Yugoslavia 220; Japan 177.
Pig iron[3] do	4,729	4,527	Poland 1,517; Czechoslovakia 874; East Germany 637.
Ferroalloys[3]	396,867	418,124	Czechoslovakia 105,995; Romania 100,671; Hungary 43,507.
Steel ingots and other primary forms thousand tons	2,170	1,559	Bulgaria 1,009[3]; Hungary 235; Yugoslavia 203.
Semimanufactures:			
Bars, rods, angles, shapes, sections do	1,969	1,367	East Germany 712; Hungary 518; Bulgaria 90.
Plates and sheets do	2,874	1,055	East Germany 499; Hungary 265; Bulgaria 147; Poland 107.
Hoop and strip do	9	13	Bulgaria 9; Yugoslavia 3.
Rails and accessories do	371	2	Mainly to Yugoslavia.
Wire[3] do	63	74	Cuba 29; East Germany 12; Bulgaria 10.
Tubes and pipes[3] do	339	594	East Germany 182; Cuba 47; Bulgaria 15.
Unspecified do	r87	2,843	East Germany 1,600[e]; Poland 514.
Total[3] do	5,712	5,948	
Lead metal, unwrought[2]	[3]98,889	35,978	Czechoslovakia 25,000; Finland 6,980; Poland 3,998.
Magnesium metal, all forms[2]	[3]11,380	5,221	West Germany 3,200; Australia 596; Yugoslavia 502.
Manganese ore and concentrate[3] thousand tons	1,411	1,342	Poland 482; Czechoslovakia 356; East Germany 185.
Mercury 76-pound flasks	r6,382	580	Australia 319; Sweden 261.
Nickel:			
Matte and speiss	r236	1,101	Sweden 1,080.
Metal including alloys:			
Scrap	r969	544	Austria 505.
Unwrought	r16,772	17,445	Czechoslovakia 6,686; Japan 2,950; France 2,922; West Germany 2,121.
Semimanufactures	--	29	All to Yugoslavia.
Platinum metal, unmarked or partly worked, not rolled value, thousands	r$203,874	$190,563	Japan $89,128; United States $55,663; West Germany $17,260.
Silver metal, scrap do	--	$165	All to West Germany.
Zinc:			
Oxide	r253	622	France 572; Japan 50.
Metal including alloys, unwrought[2]	[3]100,575	27,331	Czechoslovakia 21,000; Yugoslavia 1,456; Poland 852.
Other:			
Ash and residues, nonferrous[4]	r24,842	36,760	Austria 35,428.
Oxides, hydroxides, peroxides[4]	r1,010	841	United Kingdom 214; West Germany 174; Japan 135.
Metals:			
Metalloids	r2,515	1,479	Japan 1,345.
Alkali and rare earth metals	r318	139	United States 52; Belgium-Luxembourg 50.
Base metals, all forms, n.e.s.[4]	r8,931	4,388	West Germany 2,154; Sweden 719.
Nonferrous metals and alloys:[5]			
Unwrought	43,176	485,242	East Germany 251,672; Poland 33,114; Hungary 17,432; Czechoslovakia 12,880.
Semimanufactures	7,037	125,504	Hungary 28,448; Poland 22,157; Cuba 15,792; Bulgaria 12,390.
NONMETALS			
Abrasives:			
Hard alloys[3]	82	100	Romania 70; Bulgaria 22.
Pumice, emery, natural corundum	r857	623	All to Hungary.

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Abrasives —Continued			
Powder and dust of semiprecious and precious stones value, thousands	r$197	$185	Belgium-Luxembourg $92; Yugoslavia $91.
Grinding and polishing stones[4]	7	6	Yugoslavia 3; Finland 3.
Asbestos	[3]613,303	389,368	Poland 70,192; Japan 54,335; France 47,169; West Germany 41,296.
Boron:			
Crude, natural borates	r1,649	4,174	Japan 4,063.
Oxide and acid	r2,384	5,143	Japan 2,466; Hungary 1,542[3]; Yugoslavia 650[3].
Cement, hydraulic[3] thousand tons	3,322	2,882	Hungary 478; Czechoslovakia 423; Libya 280.
Clay and clay products:			
Crude	r84,089	65,850	Poland 64,917.
Products:			
Refractory including magnesite products[3]	126,714	132,519	Bulgaria 25,292; Romania 23,548; Cuba 21,824.
Nonrefractory	NA	5,891	All to Finland.
Diamond:			
Gem, not set or strung value, thousands	$100,627	$521,977	United Kingdom $372,404; Belgium-Luxembourg $68,090.
Industrial do	$1,464	$1,377	Belgium-Luxembourg $766; United States $610.
Feldspar, fluorspar, fluorite	r1,503	156	All to Hungary.
Fertilizer materials:			
Crude, phosphatic thousand tons	[3]5,856	4,284	East Germany 1,375; Poland 598; Czechoslovakia 496; West Germany 495; Sweden 228.
Manufactured:[3]			
Nitrogenous do	1,311	1,694	Cuba 472; Czechoslovakia 263; Turkey 186; North Vietnam 161.
Phosphatic do	530	533	Cuba 185; Bulgaria 161; Hungary 143.
Potassic do	5,986	5,567	Poland 2,647; Hungary 528; Czechoslovakia 369; Japan 290.
Ammonia do	88	163	France 122; Cuba 14.
Graphite	r10,929	12,739	Japan 5,439; Poland 4,211; United States 1,233.
Gypsum and plasters	r290,973	206,433	Sweden 92,800[3]; Denmark 45,800[3]; Norway 37,488; Finland 28,520[3].
Iodine	r26	28	All to Hungary.
Magnesite, calcined	r23,262	24,212	Hungary 11,691; Japan 4,779; Netherlands 3,982; Sweden 3,760.
Pigment	r915	1,164	All to Hungary.
Precious and semiprecious stones value, thousands	r$2,508	$3,488	Spain $2,364; Japan $349; Belgium-Luxembourg $347.
Pyrite, not roasted[3] thousand tons	1,260	873	Italy 200; East Germany 127; Hungary 81; West Germany 72.
Salt[3]	320,704	429,767	Czechoslovakia 129,828; Hungary 114,152; Finland 37,577.
Sodium and potassium compounds:[3]			
Caustic soda	39,274	43,814	Cuba 25,560; North Vietnam 2,619.
Soda ash	62,776	60,345	Czechoslovakia 23,872; Cuba 10,029; Italy 9,453; Iran 4,372.
Stone, sand and gravel:			
Dimension stone	r17,935	12,146	Italy 4,782; West Germany 4,367.
Limestone	r3,445	5,908	All to Norway.
Quartz and quartzite	r3,156	[4]149	All to Japan.
Sand	r355	325	All to Hungary.
Sulfur:			
Elemental	[3]440,978	52,179	Hungary 27,924; West Germany 11,972.
Sulfuric acid[3]	121,054	65,037	Czechoslovakia 53,750.
Other:			
Crude:			
Meerschaum, amber, jet	r6	7	All to West Germany.
Other	r71,497	56,363	Belgium-Luxembourg 19,388; Italy 11,132; Spain 10,780.
Slag, dross, other waste	--	4,250	All to Italy.
Oxides of strontium, barium, magnesium	r6,770	5,356	Finland 4,581; United States 320.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black[3]	86,635	86,279	East Germany 26,162; Bulgaria 16,840; Czechoslovakia 15,837.
Coal, anthracite and bituminous[3] thousand tons	25,951	26,896	Bulgaria 6,083; East Germany 3,837; Japan 3,224; Czechoslovakia 2,892.
Coke do	[3]4,208	[2]4,200	East Germany 1,085; Romania 1,000[2]; Hungary 795; Finland 646.
Gas, natural[3] million cubic feet	672,141	910,408	Czechoslovakia 151,393; West Germany 140,411; Italy 131,370; East Germany 118,975.

Mineral tar and other coal-, petroleum-, and gas-derived crude chemicals[3] ___ thousand tons__	507	381	East Germany 46; Italy 44; France 42; Austria 15.

[e]Estimate. [r]Revised. NA Not available.

[1]In previous editions of this yearbook chapter, data on exports of the U.S.S.R. were derived wholly from official Soviet trade returns; however, beginning in 1976, these official trade returns no longer included figures for a number of mineral commodities. As a result of this curtailment in publication of detailed statistics, it has proven necessary to use data of trading partner countries in order to provide coverage for a number of commodities. Unless otherwise specified, data in this edition are partly or wholly compiled from information on trading partner country imports from the U.S.S.R. appearing in (1) the 1976 edition of the Supplement to the World Trade Annual, v. 1, published by Walker and Company, New York, utilizing data prepared by the Statistical Office of the United Nations from official trade returns of Australia, Austria, Belgium-Luxembourg, Canada, Denmark, Finland, France, Federal Republic of Germany, Greece, Iceland, Ireland, Israel, Italy, Japan, Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, the United Kingdom, the United States (including Puerto Rico), and Yugoslavia; and (2) official trade statistics of Bulgaria, Czechoslovakia, Hungary, and Poland. As such, the figures presented may represent only a part of total Soviet exports.

[2]Subsequent to 1975, official Soviet trade returns do not provide detail regarding total exports or the distribution by trading partners of this metal; instead they provide only an aggregate for total nonferrous metals, broken down into only two categories—unwrought and semimanufactures. Figures presented here represent officially reported Soviet exports for 1975 and the summation of trading partners' reported imports from the U.S.S.R. for 1976. (See footnote 1 above for detailed list of trading partners included.)

[3]Source: Official trade returns of the U.S.S.R.

[4]Partial figure; some trading partners record additional imports from the U.S.S.R., but only in terms of value.

[5]Figures presented here represent the difference between reported Soviet exports of all nonferrous metals (divided only as to the degree of processing) and detail listed above individually under aluminum, copper, lead, magnesium, mercury, nickel, and zinc, as indicated by footnote 2. For 1975, this figure should represent only metals other than those in the foregoing list together with iron and steel; for 1976, this figure should represent not only these other metals but also quantities of the metals in the foregoing list that were exported to countries not listed in footnote 1.

[r]Revised. NA Not available.

[1]For reasons outlined in footnote 1 of table 2 data entered in this table, unless otherwise specified, are compiled wholly or in part from information on trading partner exports to the U.S.S.R. appearing in the sources listed in footnote 1 of that table. As such, the figures presented may represent only a part of total Soviet imports.

[2]Source: Official trade returns of the U.S.S.R.

[3]Subsequent to 1975, official Soviet trade returns do not provide detail regarding total imports or the distribution by trading partners of this metal, but instead provide only an aggregate for total nonferrous metals, broken down into only two categories—unwrought and semimanufactures. Figures presented here represent officially reported Soviet imports for 1975 and the summation of trading partners' reported exports to the U.S.S.R. for 1976. (See footnote 1 of table 2 for detailed list of trading partners included.)

[4]Estimated gross weight, based on reported figure for copper content of exported ore and concentrate.

[5]Partial figure; Japan reports additional exports to the U.S.S.R., but only in terms of value.

[6]Partial figure; some trading partners record additional exports to U.S.S.R., but only in terms of value.

[7]Figures presented here represent the difference between reported Soviet imports of all nonferrous metals (divided only as to the degree of processing) and detail listed above individually under aluminum, copper, lead, tin, tungsten and zinc as indicated by footnote 3. For 1975, this figure should represent metals other than those in the foregoing list together with iron and steel; for 1976, this figure should represent not only these other metals, but also quantities of the metals in the foregoing list that were imported from countries not listed in footnote 1 of the preceding table.

COMMODITY REVIEW

METALS

Development of the ferrous and nonferrous industries lagged behind goals, as foreseen in the 1976-80 5-year plan; however, production of metals and alloys continued to grow.

Nonferrous ore beneficiation facilities continued to experience poor recoveries of metal, particularly from oxide and mixed ores. Lead concentrates produced from mixed ores at the Zyryanovsk and Leninogorsk complexes in Kazakhstan contained about 60% of the lead present in the ore, and zinc concentrates carried only 30% to 50% of the zinc present in these ores. From 80% to 90% of rare and dispersed elements were discarded in tailings.

Utilization of machinery and equipment continued to be considerably below the planned levels, and modernization and replacement of equipment were slow. As a result, even at advanced enterprises in Kazakhstan's nonferrous industry, productivity was lower than at comparable enterprises in the West. The quality of the drilling rigs and self-propelled equipment lagged.

A number of nonferrous enterprises in Kazakhstan had not fulfilled the plan for exploration, mine development, stripping of overburden, and allowed losses of ores. Therefore, such large enterprises as the Leninogorsk and Irtysh polymetallic complexes did not produce the planned amount of copper, lead, and zinc in concentrates. Owing to unsatisfactory utilization of mining equipment and poor organization of labor and production, the plan for surface mining was not fulfilled by the Sayak and Severo-Dzhezkazgan open pits in Kazakhstan and by the Uchaly complex in the Urals.[59]

As a result of the irregular and uncoordinated work of mines and concentrators, as well as violation of technological processes, many beneficiation plants did not fulfill the plan on extraction and allowed losses of nonferrous metals. Some enterprises do not observe schedules for preventive maintenance and technical servicing of equipment. Leading to accidents and machine idle time.[60]

Many enterprises did not fulfill their goals on raising labor productivity, and at some enterprises of the nonferrous industry, the level of labor productivity was reduced. The Solnechnyy tin complex, the Dzhezkazgan polymetallic complex, and the Donetsk nonferrous metals plant allowed more industrial production personnel than called for by the plan.[61]

Aluminum.—The Soviet Union, second only to the United States in aluminum production, operated 14 primary reduction plants with a total probable annual capacity of 2 million tons by January 1978. Production in 1977 has been estimated at 1.79 million tons, including 150,000 tons of secondary aluminum. The estimated increase in metal output was due mainly to new production from the Krasnayarsk plant in East Siberia. Exports of metal increased from 502,365 tons in 1975 to an estimated 540,000 tons in 1977.

The output of aluminum grew 120% during 1966-75. The 43.3% increase in production of aluminum during the ninth 5-year plan (1971-75) was the highest in the industry's history. During the 1971-75 period, owing to the renovation of the electrolysis unit, output of aluminum increased 10.4% at the Bogoslov aluminum plant. Under the present 5-year plan, output in 1980 is scheduled to be 30% above the 1975 level; the regions east of the Urals are to account for the entire increase. To achieve the planned goals, it is planned to complete construction of the first potline at the Sayansk plant in Siberia. It is also planned to accelerate construction of additional alumina production facilities at the Bogoslovsk and Uralsk aluminum plants in the Urals and at the Kirovabad aluminum plant in Azerbaydzhan. The Nikolayev alumina plant, with an annual capacity of 1 million tons, is to be completed by 1980.

Due to slow construction[62] and delays in the delivery of equipment, construction of the first half of the Regar plant and the first potline at the Sayansk plant will not be completed until 1980. The second stage of the anode plant at the Bratsk aluminum refinery and facilities for the production of alumina from bauxite at the Kirovabad plant have not been completed on schedule. Because of these delays, output of primary and secondary aluminum may not reach 2 million tons by 1980.

In 1977, special attention was given to accelerating construction of the Nikolayev alumina plant and the Sayansk and Regar aluminum plants. The new potline at the

Digitized by Google

Krasnoyarsk was completed in March. The country's largest production facility for the calcined anodes was commissioned, with the assistance of Pechiney-Ugine-Kuhlmann, at the end of 1977. After complete renovation, the No. 1 potline at the Bratsk plant was brought up to designed capacity in September. The potline at the Kirov aluminum plant in Volkhov has also reached designed capacity.

Idle times of railroad cars of the Ministry of Railroads exceeded the norms, for which enterprises of the nonferrous industry paid large fines. The cars were unloaded especially poorly at the Krasnoyarsk, Bratsk, and Ural'sk aluminum plants.[63]

The Northern Urals continue to be the main bauxite and alumina producing region. Production of alumina at the Bogoslovsk plant in the Urals increased 22.7% during 1971-75. An additional 70 to 80 million rubles of capital investment is required to obtain capacities for the production of alumina equal to those put into operation at Bogoslovsk during 1971-75. There are five underground and one open pit bauxite mines in operation in the North Urals bauxite region. Production of bauxite in this region increased by 300% during 1945-57 and by 43% during 1967-77.

The second largest bauxite and alumina producing area is Kazakhstan, where the Pavlodar alumina plant No. 1 is among the nation's largest. Plant No. 2 is under construction. Output of alumina at this plant rose 23.7% during 1971-75. The plans call for increases in production of alumina at Pavlodar by 9.4% in 1980 and by 20.4% in 1985 compared with the 1975 level. The plant processes low-quality Turgay bauxite and high-quality imported bauxite. The Severoonezhsk bauxite deposit in Arkhangel Oblast' came onstream in November. Exploration of the Vezhayu-Vor'ekvin (Timan) and Vislovsk (KMA) desposits of bauxite was completed in 1977.

Although the Soviet Union is a large producer of low-grade bauxite, supplies are insufficient, and it is developing alumina production from nepheline and alunite. The alumina is produced from nepheline concentrates only at the Volkhov aluminum plant and at the Pikalevo complex in Leningrad Oblast'. The nepheline is produced at the Apatit complex in the Kola Peninsula and at the Achinsk alumina plant in Siberia. The Razdan alumina-from-nepheline plant in Armenia, which had been under construction since 1968, was to supply alumina to the Sumgait aluminum plant in Azerbaydzhan. Because of the inefficiency in production of alumina from nepheline and pollution of the atmosphere and water, construction of this plant stopped in 1977.[64]

The nepheline-based alumina capacity in Leningrad Oblast' was limited to processing only 1.5 million tons of nepheline concentrate and production of not more than 335,000 tons of alumina from nepheline in 1977. The Achinsk alumina-from-nepheline plant, based on the Kiya-Shaltyrsk deposit, was under construction for a number of years. When it was started up, it proved unprofitable and the rated output indicators have yet not been achieved.[65]

The Kirovabad alumina-from-alunite plant in Azerbaydzhan started production in 1965 but did not reach its planned output. A massive capital investment was allocated to this plant for the 1976-80 period. Facilities for producing alumina from bauxite were to be commissioned in 1976, but the goals were not met. The facilities, which are twice as large as the earlier ones, were commissioned at the end of 1977.

Under a current agreement, Hungary delivered 260,000 tons of alumina to the Soviet Union annually. The agreement envisaged a gradual increase to 330,000 tons of alumina per year in 1980-85. The Zvornik alumina plant in Yugoslavia, the country's largest enterprise processing bauxite into alumina, was being built with Soviet assistance. Its first output, to be produced in 1978, was to be sent to the U.S.S.R. Reportedly, in accordance with the Guinea-Bissau Soviet agreement of February 1977, Soviet geologists continued the examination of the Guinea-Bissau's bauxite deposits. Also, reportedly, Iran was to build a $600 million, 500,000-ton-per-year alumina-from-alunite plant with the aid of Soviet technology and know-how.

The U.S.S.R. operated 15 secondary aluminum units with a total estimated annual capacity of 190,000 tons in 1977. Production was estimated at 150,000 tons of aluminum and its alloys. A second induction furnace for production of secondary aluminum was put into operation at the Sumgait primary aluminum plant in June. Another furnace was to be built by 1980, and the production of secondary aluminum was to increase by 40%. The average selling price of secondary aluminum in the Soviet Union was about 490 rubles per ton in 1977.

Digitized by Google

In 1975-77 the Soyuzvtortsvetmet (secondary nonferrous metals) enterprises did not fulfill targets on extraction of secondary aluminum. The greatest losses of metals were being allowed by the Mtsensk and Sukhodol'sk secondary nonferrous metal plants and the Gor'kiy, Tashkent Odessa, and Perm procurement administrations of the Vtortsvetmet.[66]

Antimony.—Deposits of antimony occur at Kadamzhay in Kirgiziya, Dzhidzhikrut in Tadzhikistan, Turgay in Kazakhstan, and Sarylakh and Tazhdolinsk in Siberia. A new antimony production section was commissioned at Kadamzhay, the principal center, in January and production of metal was to be increased by 33%. Renovation of smelting facilities and the development of a new underground level at Kadamzhay mine continued in 1977.

Construction of the new Azhob mine and mill unit (Dzhidzhikrutskiy complex) in Tadzhikistan continued in 1977. During 1966-75, extraction of antimony ore at this complex nearly doubled. An antimony deposit, associated with gold, was under development at Sarylakh in Yakut A.S.S.R. near the Arctic Circle.

Beryllium.—The Soviet Union continued to be one of the world's largest producers and consumers of beryl, beryllium alloys, and metal. Beryllium is found in variable quantities in most of the pegmatites all over the U.S.S.R. There are numerous deposits, mainly in Kazakhstan, Kola Peninsula, Urals, Altay, Transbaykal, Soviet Far East, and Western Ukraine. Domestic reserves are more than adequate. Production was being expanded, and the probable level in 1977 was 1,700 tons of beryl (10% to 12% BeO). It was planned to recover beryllium from the ore of the Dzhidinsk tungsten and molybdenum complex in Buryat A.S.S.R.

Bismuth.—Bismuth is recovered as a byproduct of lead and zinc smelting in Kazakhstan and other areas of the Soviet Union, from dust and crude metal at the Balkhash and Mednogorsk copper complexes, and from tungsten and molybdenum ores. The Ustarasay mine in the Chatkal Mountains is the only enterprise in the U.S.S.R. to mine bismuth ore. The concentrates from this mine are shipped to the Chimkent lead plant for processing.

Cadmium.—Cadmium is produced at various lead and zinc smelters as a byproduct. The Leninogorsk polymetallic complex in Kazakhstan continues to be one of the largest producers. It is planned to obtain a large quantity of cadmium from lead slag.

Chromium.—With an estimated output of 2.18 million tons, the U.S.S.R. was the world's second largest chrome ore producer and exporter in 1977. Over 30% of the production was exported, and about 40% of this was destined to Western countries. While prices for Soviet chromite remained relatively steady, the 1977 shipments were below those of 1976. This was the third successive year that the U.S.S.R. had maintained or increased prices and reduced supply. According to unofficial reports, the f.o.b. prices from the U.S.S.R. rose from $150 to about $155 per ton, 48% Cr_2O_3 basis, with a 4:1 iron ratio. Output of chromite was expected to be 2.3 million tons in 1980. Approximately 40% of the total production was to be exported. During 1950-75, production of chromite ores increased 300%.

Chromite ores are located in Kazakhstan and in the Urals. Measured reserves are estimated at 20 to 25 million tons, and gross reserves add a further 75 million tons. About 94% of the total reserves are in Kazakhstan with the balance in the Urals. The Donskoye mining administration at Khrom-Tau in Aktyubinsk Oblast' of Kazakhstan, which produces over 90% of the Soviet output, is the only supplier of high-quality ore. Deposits of chromium ores in the Urals, which have a low chromium oxide content (20% to 40%) as well as a low Cr_2O_3-Fe ratio, are mostly used in the chemical and refractory industries.

The Donskoye deposits are presently mined selectively at five small open pits. The grade of most ores is adequate for shipping after hand picking. Two mills were in operation at Khrom-Tau during 1977, with a design capacity of 1.5 million tons per year of marketable ore (2.5 million tons of crude).

Output of marketable chromite from the Saranovskoye underground operation in the Urals was estimated at about 10% of the total Soviet production, or about 220,000 tons.

Cobalt.—Gross cobalt reserves are estimated at about 100,000 tons of contained metal, chiefly in nickel-cobalt ores and in cobalt ores of the Khovu-Aksinsk deposit in the Tuva Autonomous Republic. Production continued to be concentrated at Norilsk in Krasnoyarsk Kray; at Monchegorsk and Pechenga on the Kola Peninsula; in the Urals at the Yuzhuralnikel, Ufaley, and

Digitized by Google

Rezhsk plants; and also at some copper plants. Cobalt production rose 16% between 1970 and 1975 and was expected to increase by a similar amount during 1976-80.

Copper.—In 1977, the Soviet Union produced an estimated 1,000,000 tons of blister, including 170,000 tons of secondary copper, from 13 smelters with a total probable annual capacity (January 1, 1978) of 1.1 million tons. The secondary blister copper was produced by the Kirovgrad smelter in the Urals, by a Moscow smelting and electrolytic plant, and by several small units of the secondary nonferrous plants. There are 11 refineries in operation.

The country operates 40 concentrators with a total probable annual capacity of about 5 million tons of copper concentrates. Production of concentrates in 1977 has been estimated at about 4 million tons with an average copper content of about 20% (from 12% to 36%).

Sixty-five underground mines and open pits produced an estimated 125 million tons of copper ore in 1977. Approximately 80% of all ore was mined by open pit methods. Up to 10% of primary copper was produced as a byproduct.

Distribution of Soviet smelters and refineries is shown below:

Plant	Location	Type	Began operation
Balkhash	Kazakhstan	Smelter and refinery	1940
Dzhezkazgan	do	do	March 1971
Irtysh-Glubokaya	do	do	Early 1920's-1938
Almalyk	Uzbekistan	do	1965
Kirovgrad	Urals	Smelter (primary and secondary)	1913-May 1922
Kyshtym	do	Refinery	October 1922
Karabash	do	Smelter	May 1925
Krasnoural'sk	do	do	September 1931
Pyshma	do	Refinery	August 1934
Sredneural'sk	do	Smelter	June 1940
Moscow	Moscow	Smelter (secondary) and refinery	1922
Alaverdy	Armenia	Smelter and refinery	1925-46
Severonikel	Kola Peninsula	do	1939
Pechenganikel	do	do	1944
Norilsk	West Siberia	do	1945

Soviet copper consumption by industry is shown, in percentage, in the following tabulation:

	Percent
Production of cables	40.0
Electric engineering industry	14.5
Machine building	12.0
Automobile and tractor construction	8.0
Nonferrous metallurgy	2.0
Consumer goods	3.0
Construction	.3
Other	20.2
Total	100.0

Source: I.M. Gratsershteyn and R.D. Malinova. Ekonomika, organizatsiya i planirovaniye proizvodstva v tsvetnoy metallurgii (Economics, Organization and Planning of Production of Nonferrous Metallurgy). Moscow, 1971.

About 50% of the total consumption of copper is used as pure metal, between 30% and 40% is consumed in alloys, and about 3% is used for chemical products.

Under the new 5-year plan, output in 1980 was scheduled to be 20% to 30% over the 1975 level. If this is achieved, the U.S.S.R. will provide 1.1 million tons of primary and secondary copper by 1980. This might allow more surplus for exports, which increased from 123,000 tons in 1970 to 205,618 tons in 1975. Estimated exports in 1977 were 220,000 tons, with about 300,000 tons projected for 1980. During the 1980-90 decade, the Soviet copper industry will depend for expansion primarily on the Norilsk mining and metallurgical complex and on the Udokan deposit. The completion of the BAM railroad will reduce Udokan development costs and simplify the entire project.

During 1966-75, production of blister increased 50% and output of refined copper rose 41%. In 1977, production of copper ore increased at Sayak (Balkhash complex) and Sary-Cheky (Almalyk complex) and at the Tishinsk, Nikolayev, Orlov, Vostok, and No. 65 underground mines in Kazakhstan; but plan targets were not fulfilled at the Sayak, Severo-Dzhezkazgan, and Uchaly open pits. A shortage of copper concentrates, particularly at the Balkhash complex, resulted in unused smelting capacity.[67]

Digitized by Google

To overcome the lag in copper ore production, considerable amounts of money were directed to developing mining operations in 1977. Additional facilities were put into operation at the Dzhezkazgan and Balkhash complexes and at a number of other enterprises in Kazakhstan, the Urals, and the Bashkirian A.S.S.R.

Kazakhstan continued to be the main production center, and the Balkhash complex was the largest copper producer in 1977. A new oxygen electrosmelting furnace was put into operation at the Irtysh complex. Construction of the Zhezkent mine and concentrator and the East Kazakhstan copper-chemical complexes in Kazakhstan continued in 1977; completion of the first stages was scheduled for 1980. It was planned to complete construction of the Karagaylin complex by 1980. Construction of the Boshchekul copper-molybdenum mining and concentration complex and the concentrators at the Dzhezkazgan and East Kazakhstan copper-chemical complexes was started in 1977.

The Urals is the second largest copper-producing region, but the Krasnouralsk, Kirovograd, and Karabash copper smelters in the northern Urals continued to experience a shortage of concentrates. During the past decade, copper grades at all three mines at the Kirovograd complex and at the Degtyar, Gumashev, and Krylatov mines of the Degtyar mine group have decreased. The third section of the Sibay concentrator at the Bashkir copper-sulfur complex was commissioned in December. At the Uchaly complex, in the southern Urals, development of the Molodezhnyy open pit began in November.

During 1973-76, the extraction of copper in concentrate in Armenia increased by 1.32% at Kadzharan, by 3.35% at Agarak, and by 1.02% at Kafan. At the same time, copper content in processed ores decreased by 0.0025% at Kadzharan, by 0.106% at Agarak, and by 0.155% at Kafan. In 1971-77 renovation of the Alaverdy metallurgical complex continued; the technology of electric smelting of calcined copper concentrates was mastered at this complex for the first time in the country. Reverberatory furnaces and converters were converted to natural gas heating. The copper content in copper-molybdenum ores in Armenia ranged from 0.316% to 1.23% and the recovery of copper in copper concentrate from 72.21% to 86.56% in 1977. There are not enough copper ore reserves for the depreciation period of the Kafan and Agarak mining and beneficiation complexes. The Kadzharan and Kafan complexes became parts of the new Zangezur complex in 1977.

In 1976, the Alaverdy complex in Armenia had a shortfall of 3.92% (88.78% instead of the planned 92.7%) in extraction of copper from copper concentrate (16.5% Cu) in blister. Owing to the bulk shipment of different copper concentrates from seven concentrators, hundreds of tons of copper are lost each year. The amount of irrevocable copper losses in dump slags is about 4%, while copper losses in gases and dust are 2.8%.

During 1971-75, capacity of the Almalyk concentrator in Uzbekistan increased 16% and processing of copper ore rose 32.9%. It is planned to achieve the design capacity of the oxygen electrosmelting furnace at Almalyk and construction of a second furnace was to start in 1978. In 1980, processing of copper ore at concentrators was planned to increase 7.5%, and the recovery of copper in concentrates was to improve by 1.6% over the 1975 level. There were 27 shovels in operation at the Kalmakyr open pit of the Almalyk complex in 1977. Exploration of the Sarycheku and Kalmakry deposits at this complex continued. Exploration of the Dal'nyy copper deposit in Uzbekistan began in 1977.

Construction of the Norilsk No. 2 copper and nickel smelters continued in 1977 with Finnish technical assistance. Flash smelting plants for copper and nickel from Outukumpu Oy, Finland, had already been delivered to the Norilsk complex. The annual capacity of the smelters will be 550,000 tons of nickel concentrate (100,000 tons of nickel) and 650,000 tons of copper concentrate (200,000 tons of copper). Completion of the first stages was scheduled for 1980.

Reportedly, agreements were signed between the U.S.S.R. and India on the development of a copper deposit at Malanjkhand. The Soviet Union offered to supply earth-moving equipment to India under a 15-year credit.

Gold.—In 1977, the U.S.S.R. was the world's second largest producer of gold, with an estimated output of 245 tons (7.85 million ounces). The growth in Soviet gold production reportedly resulted mainly from expansion of placer mining in the northeast of the Asian part of the country. Over two-thirds of the total output came from the

Digitized by Google

Soviet Far East and East Siberia; most of the balance came from gold and polymetallic ores in the Urals, Kazakhstan, Armenia, and Uzbekistan. Nearly all of the Soviet placer production came from Kolyma, Aldan, Indigarka Yana, Chukotka, and the Urals. The gold mining industry is making wide use of rubber-tired heavy bulldozers (equipped with rippers) and walking draglines to mine deep alluvial deposits. Complex base-metal ores are an important source of gold; according to Soviet sources, over 20% of gold is produced as a byproduct. During the current 5-year plan, production of gold is to be increased in the Soviet Far East, East Siberia, Kazakhstan, Armenia, and Uzbekistan. Gold production is estimated to be 250 tons in 1978 and 260 tons in 1980.

Potential reserves of gold were estimated at about 6,200 tons (200 million ounces) in 1977. Measured reserves were reportedly sufficient for a 12- to 15-year operation at current production rates. Extensive prospecting continued in the Asian part of the country. The discovery of several small vein deposits in Kazakhstan and Uzbekistan was reported in 1977. Several new placer deposits were found at Chukotka and in other regions of the Soviet Far East and Yakutia. However, despite the new discoveries, the rate of incremental growth of ore reserves was lagging behind gold production.[68]

Magadan Oblast' is the main producing center, with 32 placer mines, 23 dredges, over 500 sandwashing rigs, and about 1,500 bulldozers. Three new mines were established in January 1977 by order of the Severovostokzoloto (Northeastern Gold) Association of Magadan Oblast'. They are the Berelekh, with its center at Shirokiy, and the Orotukan and Spornoye mines at settlements of the same name. A new small underground mine was developed at the Korall section of the Bilibino gold mining and concentrating complex in 1977.

The Karamken mining and concentrating complex was the main priority construction project in Magadan Oblast' in 1977, but work was hampered by shortages of equipment. Similarly, development of the Dukat mine in this Oblast' was not satisfactory.

Development of the Muruntau deposit in Uzbekistan, which was discovered in 1960, continued in 1977. The Muruntau open pit (50,000 square meters) was about 100 meters deep in 1977 and the overburden-to-ore ratio was 35:1. The design capacity of both stages of the Muruntau complex is 25 tons of gold per year. Estimated output of gold at this complex in 1977 was 12 tons. Special attention was paid in 1977 to improving technology of gold recovery at the Ararat plant in Armenia, which is fed by ores from the Zod deposit. During 1966-75, recovery of gold at the Sredneuralsk copper complex in the Urals increased 2%.

Iron Ore.—In 1977, 71 underground mines and 63 open pits, with a total capacity of 280 million tons of usable ore, produced 240 million tons of usable ore (direct-shipping ores plus concentrates), an increase of 0.6 million tons over 1976 production. Production of usable ore was scheduled to reach 275.5 million tons (crude ore 560 million tons) in 1980. The following capacity increases were to be accomplished during 1976-80: For usable iron ore, 115.4 million tons; and for sinter and pelletized concentrate, 22.5 million tons.

Annual production capacity of crude ore was increased by 14.1 million tons, compared with a 45-million-ton increase in 1976. The following facilities were commissioned in 1977: The second stage of the Mikhaylov iron ore complex in Kursk Oblast', with a capacity of 3.1 million tons of pellets; the second stage of the Lebedi complex in Belgorod Oblast', with a capacity of 2.15 million tons of pelletized concentrates; the 10th section, with capacity of 0.7 million tons of concentrate, at Kovdor complex in Murmansk Oblast'; and the first stage of the Vostochnyy open pit at Magnitogorsk, with an annual capacity of 1.5 million tons of crude ore.

Shaft sinking for the first stage of the Yakovlevo underground iron ore mine in Belgrad Oblast' began in May 1977. The mine will be 740 meters deep and will have a capacity of 4.5 million tons of crude ore. Development of a new open pit in Kirovgrad Oblast', Ukraine, with an annual capacity of 9 million tons of crude iron ore, began in May.

Ninety-two iron ore concentrators, 29 of which had sintering and 6 of which had pelletizing facilities, produced an estimated 160 million tons of concentrate, 156.7 million tons of sinter, and 36.2 million tons of pellets in 1977. The average iron content was 59.3% in usable ore (including concentrate) and 32.5% in the ore shipped for upgrading.

Exports of iron ore have been substantially maintained at an estimated 43 million

Digitized by Google

tons in 1977 against 43.1 million in 1976 and 43.6 million in 1975. The principal importers of Soviet iron ore are Czechoslovakia, Poland, Romania, Hungary, German Democratic Republic, and Bulgaria, which receive about 90% of the total Soviet exports. The U.S.S.R. is meeting 85% of the iron ore requirements of the Comecon countries. In 1966-70, Soviet iron exports to these countries totaled 72 million tons of iron content. Under the 1976-80 plan, exports are scheduled to reach up to 110 million tons of iron content. Details of Soviet total iron ore production and by region, in million tons, is as follows:

	1965	Actual		Estimated 1977
		1970	1976	
Crude ore	237.5	355.1	458.3	470.0
Iron content in crude ore, percent	40.8	37.3	36.1	36.0
Usable ore	152.8	195.5	238.1	240.0
Iron content in usable ore, percent	56.8	58.8	59.3	59.3
Iron content in crude ore concentrated	35.2	32.8	32.6	32.5
Production of iron ore concentrate	80.75	120.8	159.0	160.0
Iron content in concentrate, percent	59.3	61.81	62.4	62.4
Production of pellets	.28	10.6	31.4	36.2
Production of sinter	111.29	138.2	152.7	156.7
Surface mining, percent	71.8	79.2	83.0	83.0

Central	28.0	21.2	59.1	31.0
Dneprov	34.0	19.8	66.0	33.8
Sokolov-Sarbay	29.5	29.7	125.3	140.1

Source: Gornyy zhurnal (Mining Journal), Moscow, No. 11, November 1977, p. 6.

The Ukraine produced over 52% of Soviet iron ore in 1977, and the Krivoy Rog Basin produced about 90% of the Ukraine's total 1977 output. Some 62% of the country's underground iron production came from 23 Ukrainian mines. The average production cost of iron ore from these mines was 4.22 rubles per ton in 1975. Production cost of surface mined crude iron ore was about 1 ruble per ton.

The Kursk region was the second largest producer, followed by the Urals, Kazakhstan, Siberia, and the Kola Peninsula. Usable iron ore production in the Kursk region increased from 17.8 million tons in 1970 to an estimated 39.6 million tons in 1977. Extraction of 41.2 million tons of iron ore from this region is planned for 1978. Over half of this is to come from the Lebedi

Digitized by Google

mining and concentrating complex. The ore from the Kursk region is shipped to metallurgical plants in the Center region, the Urals, and the Ukraine.

Iron ore production in Kazakhstan accounted for 9% of the total, mainly from the Sokolov-Sarbay complex, with an annual capacity of about 30 million tons of crude ore (13.4 million tons of concentrate and pellets).

The U.S.S.R. Ministry of Ferrous Metallurgy, after investing over 250 million rubles in construction of the Lysakov mining and concentration complex in Kazakhstan, suddenly began holding back its development. As a result, the first stage of this complex, with a capacity of 13 million tons of crude iron ore and 6.5 million tons of concentrate per year, was only half attained. The ore contains only 40% iron, and no matter how it is concentrated, good results cannot be obtained. The geologists did not explore the deposit fully.

It is planned to construct a pilot commercial plant for testing the Lisakovsk concentrate, which contains so much phosphorus that pig iron obtained cannot be smelted in an open-hearth furnace. Special facilities are needed, involving time and large capital investment.[69]

Total national minable reserves, divided into categories "A" (measured), "B" (indicated), and "C_1" (inferred), were estimated at 67,300 million tons averaging about 38% iron. Exploration of the Tashtagol, Kholzun, and Belorets iron ore deposits in Siberia continued in 1977.

According to an October 1973 agreement, Finnish companies are building the Kostamush iron ore complex in Soviet Karelia about 30 kilometers from the Finnish border. This project will be built in three stages and will have an annual capacity of 8.9 million tons of pellets (24 million tons of crude ore). Construction of the first stage started in 1977 and will continue till 1982, allowing for the production of about 3 million tons of iron ore pellets per year. Finland will buy up to 1.2 million tons of iron ore pellets per year during 1983-90. The deposit contains an estimated 1,200 to 1,500 million tons of ore with an average iron content of 31%. Construction will take from 8 to 10 years.

Reportedly, the Soviet Union has ordered eight 310-horsepower bulldozers from Poland's Burmar for delivery in 1978. The units will be built in Poland under a licensing agreement with International Harvester Co. These bulldozers will be used to develop iron ore open pits in the U.S.S.R. as part of a Soviet-Polish joint project.

Iron and Steel.—The Soviet iron and steel industry leads the world in total quantity of iron ore mined, coke, refractories, ferroalloys, steel, and steel pipe produced. Each year, the plan for rolled steel is fulfilled, but millions of tons of rolled products are not supplied against orders. Even with large imports of wrought products, there are shortages of many steel products in the U.S.S.R.

In view of the small share of plate-rolled steel in metal production, the share of shaving in machine building is very large. More than 1,000 million rubles are spent annually on the cutting of shavings. According to Soviet published data, the conversion of 1 million tons of rolled ferrous metal products from machinery to precision forging will enable 250,000 tons of metal to be saved and 16,000 metal-cutting machines and more than 20,000 workers to be released. According to TsNIIMPS (Central Scientific-Research Institute of the Ministry of Railways) data, because of inadequate treatment, transport loses about 600,000 tons of steel annually to corrosion. Each year, 150 million rubles are spent to repair and replace structures that have corroded. In the oil industry, 80,000 tons of pipe are lost annually from corrosion.[70]

Of the production facilities put into operation in 1960 and subsequent years, that have been surveyed by the U.S.S.R. Ministry of Ferrous Metallurgy, 49.2% did not attain the planned output, 59.7% did not attain labor productivity, and 85.3% did not meet planned production cost. In the Soviet Union, 23% of workers are working with outdated equipment in pig iron production, 43% in steel smelting, and 42% at rolling operations. Because of poor quality of refractories, their consumption in the Soviet Union is 65.3 kilograms per ton of steel produced, compared with 28.1 kilograms in the United States and 22.1 kilograms in Japan.

Ferrous metallurgy consumes about 18% of the fuel used by the entire industry of the country and about 16% of the electric power. In metallurgy, electric power is used primarily for driving electric machines (65%), in steel and alloy smelting electric furnaces (27%), and for illumination (3%). The use of electric power in the ferrous industry was to increase from 88.1 billion kilowatt-hours in 1975 to 125 billion

Digitized by Google

kilowatt-hours in 1980.

In 1977, 36 enterprises, operating 137 blast furnaces, produced 107 million tons of pig iron (planned quota 111.2 million tons), a 2% increase over that of 1976. Estimated outputs for 1978 and 1980 were 110 million and 115 million tons, respectively. The average blast furnace capacity increased from 1,135 cubic meters in 1971 to 1,258 cubic meters in 1977 and was to rise to 1,352 cubic meters by 1980. About two-thirds of all blast furnaces use oxygen for enrichment; over 83% of the pig iron was produced by partial use of natural gas and 75% by use of oxygen.

The construction of the No. 6 blast furnace (3,200 cubic meters, 2.2 million tons per year of pig iron) at Lipetsk continued in 1977. It was planned to invest over 30 million rubles on this project. Completion was scheduled for 1978. Reportedly, construction of blast furnace 5 at Cherepovets plant began in 1977. The furnace is to have a capacity of 5,500 cubic meters, will be 110 meters high and 15.1 meters in diameter, and will produce 4.5 million tons per year of pig iron. Renovation of No. 1 blast furnace at the West Siberian plant in Novokuznetsk and No. 2 blast furnace at Novolipetsk plant was completed in 1977.

The planned capacity of Soviet blast furnaces is shown in the following tabulation:

	Capacity, cubic meters			
	1,033	2,000	3,200	5,000
Annual production of pig iron ___ million tons__	1.1	2.0	3.0	4.6
Number of workers _____	68	92	118	151
Consumption of fuel per ton of pig iron production:				
Coke, dry _ kilograms__	408	395	383	374
Natural gas cubic meters__	149	140	133	127
Oxygen_____do____	171	161	153	146

Source: Shiryayev, P.A., and V.P. Adrianova. Chernaya metallurgiya S.S.S.R. v desyatoy pyatiletke (The Ferrous Metallurgy in the Tenth 5-Year Plan). Moscow, 1977, p. 36.

Production of pig iron by type is shown in the following tabulation:

	1976		1977	
	Million tons	Percent of total	Million tons	Percent of total
Total pig iron production _____	105.3	100.0	107.4	100.0
Of which:				
Steelmaking pig iron _____	96.6	91.7	98.7	91.9
Foundry pig iron _____	7.8	7.4	7.8	7.3
Ferromanganese	.8	.8	.8	.7
Other _____	.1	.1	.1	.1
Production of pig iron using:				
Natural gas___	88.6	84.1	90.5	84.3
Oxygen _____	83.8	79.6	85.5	79.6

Crude steel production from 76 metallurgical works increased 1% to 147 million tons in 1977 (planned quota 151.1 million tons). There were 40 oxygen converters (including 7 with a capacity of 250 to 300 tons) in operation in January 1977. The first stage of the country's largest oxygen converter plant, including two 350-ton converters with an annual capacity of 3.5 million tons, was put into operation at the Azovstal' Zhdanov plant in December. The first stage of the oxygen converter shop (350-ton capacity) was under construction in 1977 at the Cherepovets plant. Construction of a new oxygen converter shop at the Dzerzhinsk works in the Ukraine started in May. Completion of three converters is scheduled for 1980; these will replace a Bessemer furnace and several open hearths. Renovation of converters at the Novolipetsk and West Siberian plants began in 1977. The Soviet steel industry consumed about 83 million tons of ferrous scrap. It was planned to produce 42.5 million tons of oxygen converter steel in 1978.

An open-hearth two-bath furnace, with a capacity of 1.5 million tons of steel per year, was put into operation at the Krivoy Rog Lenin plant in September. It was the fifth "two-bath" furnace in the country and the largest in the Soviet Union. An electric furnace, with an annual capacity of 250,000 tons, was under construction at the Beka-

Digitized by Google

bad plant in Uzbekistan. Four additional such furnaces were to be constructed at this plant.

Expansion plans, costing some 2,000 million rubles, were announced for Magnitogorsk. It was planned to construct two blast furnaces, with a capacity of 5,000 cubic meters each, an oxygen converter shop, and new rolling mills. The old rolling mills were to be renovated. At the Novolipetsk works, the main construction projects included blast furnace No. 6 (capacity 3,200 cubic meters) which was under construction and was due to start production in the second half of 1978. On completion of the program, the Novolipetsk works output was to be on the Magnitogorsk level.

The Oskol electrometallurgical complex, which will process ore from the Kursk Magnetic Anomaly, is one of the major construction sites of the 1976-80 plan period. This is the first enterprise in the country designed to produce steel by direct iron reduction. It is being constructed by West German firms. In December 1977, Soviet Metallurgimport awarded to West German Korf Stahl A.G. and Lurgi Chemie and Huettentechnik GmbH a DM500 million contract for four Midrex direct reduction units. A DM185 million order for a pelletizing plant, with an annual capacity of 2.5 million tons, was awarded to Salzgitter A.G. The percentage distribution of steel production was as follows:

Process	1960	1970	1976	1977
Oxygen converter	3.8	15.3	26.0	26.8
Electric steel	8.9	10.7	9.9	9.9
Open hearth	84.4	76.6	63.4	62.7
Bessemer	2.9	1.4	.7	.6
Steel production by continuous casting	NA	NA	7.9	8.3

NA Not available.

Soviet rolled ferrous output in 1977 totaled 118 million tons, of which 102 million tons was finished products (planned quota 105.4 million tons), a 0.7% increase over that of 1976. A rolling mill, with an annual capacity of 1.0 million tons of rolled steel, went onstream at the Nizhniy Tagil complex in November. Another rolling mill was made operational at the Lenin works in Kuznetsk in 1977. Construction of the "3,000" rolling mill at the Lenin plant in Zhdanov started in June. Reportedly, its annual capacity is to be 2.5 million tons of sheet steel for manufacturing oil and gas pipe.

In terms of tonnage, the Soviet Union was the largest world producer of steel pipe, with a total of 17 million tons in 1977, a 1% increase over 1976 production. Construction of facilities for pipe production began at Vyksa metallurgical plant in Gor'kiy Oblast' in May. Pipe developments in the U.S.S.R. included the construction of a new 15,700-ton-per-year pipe mill at the Azerbaydzhan plant and the 320,000-ton-per-year mill at the Severskiy plant in Sverdlovsk Oblast'.

The 11th of the 12 electric-smelting furnaces at Yermak ferroalloys works in Kazakhstan reached its planned capacity in September. The electric furnace, with an annual capacity of 50,000 tons, was completed in 1977. It is planned to construct one more electric furnace of the same capacity at this plant. Construction of the Yermak No. 2 ferroalloys plant began in 1977. It will have four electric-smelting furnaces. Two electric furnaces were under construction at the Nikopol' ferroalloys works in the Ukraine.

The No. 9 oxygen-producing unit, with a capacity of 35,000 cubic meters per hour, became operational at the Krivoy Rog plant. Construction of the No. 10 unit at the same plant began in 1977. The country's only shop for processing steel smelting slag from oxygen converter production was put into operation at the Novolipetsk plant in 1977. Two Soviet-equipped technological lines are to produce more than 2 million tons of construction material per year.

The plan for 1978 provided for the production in the U.S.S.R. of 111.6 million tons of pig iron, 152.4 million tons of crude steel, 106.3 million tons of finished rolled products, and 17.7 million tons of steel pipes. Improved quality and expanded range of products were planned for 1978.

It was planned to produce 15 million tons of steel (an increase of 2.5 million tons) by continuous casting in 1978, principally as a result of the commissioning in 1978 of a new converter shop with continuous casting at the Azovstal' plant.

The main construction targets in the plan for 1978 were the commissioning of a blast furnace and a coke-oven battery at the Novolipetsk and Cherepovets plants; increases in the steelmaking capacity of the converter shops at the Nizhniy-Tagil and Krivorozhstal' plants and the electric furnaces at the Uzbek and Donetsk steelworks; and the commissioning of an "800" universal mill at the Orsk-Khalilovo plant and at

Digitized by Google

the new pipe-rolling mills at the Novomoskovsk and Volga pipe works.

Planned production of ferrous metallurgy products in 1980 is detailed in the following tabulation, in million tons:

Commodity	Reported production 1975	Planned production 1980	
		Original plan	New adjusted plan[1]
Iron ore, usable	233	NA	275.5
Pellets	27	62	62
Pig iron	103	NA	121.9
Steel, raw	141	160-170	153.7
Rolled finished ferrous metal	98.6	115-120	114.1
Steel pipe	16.0	NA	18.8

NA Not available.
[1]Koks i khimiya (Coke and Chemistry). Moscow, No. 10, October 1977, pp. 2-4.

In 1975, 83 blast furnaces, 161 open-hearth furnaces, and 35 converters used oxygen and smelted 75.3% of all pig iron, 68% of open-hearth steel, and 96% of converter steel. Expansion of the use of oxygen in ferrous metals production was to continue in 1976-80. It was planned to increase the consumption of natural gas in blast furnaces from 8 billion cubic meters in 1975 to 11.7 billion cubic meters in 1980. The consumption of heavy oil by ferrous metallurgy was to be increased by 96%.

Soviet engineers designed a large metallurgical works for Nigeria. The Soviet Union was to also provide equipment and train local personnel for the plant.

Lead and Zinc.—With estimated output of primary lead at 510,000 tons and zinc at 735,000 tons, the U.S.S.R. was probably the world's second largest producer in 1977. Estimated output of secondary metal was 100,000 tons of lead and 80,000 tons of zinc. Estimated primary production in 1980 was 530,000 tons of lead and 760,000 tons of zinc. Lead exports increased from 92,400 tons in 1970 to an estimated 95,000 tons in 1977, and zinc exports rose from 95,100 tons to 100,000 tons over the same period. The Soviet Union imported an estimated 55,000 tons of lead and 45,000 tons of zinc in 1977.

During 1966-75, output of zinc increased 85.7%. In 1965, 29.5% of the lead and 21.7% of the zinc was produced with the use of oxygen blast, compared with 71% and 63.3% respectively in 1976. Over 10% of the total lead and zinc production was recovered as a byproduct in 1977.

Ore reserves were estimated in 1977 at 16 million tons of contained lead and 20 million tons of contained zinc; over two-thirds are located in Kazakhstan, chiefly in the Altay region and in the district of Kara-Tau. There are also large reserves of zinc in the Urals. Exploration of the Khandizin and Uchkulach lead and zinc deposits in Uzbekistan and Kaudag polymetallic deposit in Azerbaydzhan continued in 1977. Examination of the Filizchay and Kanday lead and zinc deposits was completed in 1977.

Kazakhstan continued to be the leading lead and zinc producer, followed by the Urals, Siberia, Uzbekistan, North Caucasus, Ukraine, and the Soviet Far East. The Ust'-Kamenogorsk lead and zinc complexes in Kazakhstan, one of the leading enterprises in the Soviet lead and zinc industry, increased production of lead 300% during 1950-75. Construction of the Zhayremsk mining and concentration complex continued in 1977. Two open pits at this complex began production, but as the concentrator was still under construction, the ore was shipped to other enterprises in Kazakhstan and even to Georgia.[71] The Zhayremsk deposit of polymetallic ore consists of the Zhayrem, Ushkatyn, Bestobe, and Kuzhal ore bodies. At the Leninogorsk polymetallic and Zyryanovsk lead complexes in this Republic, self-propelled equipment was underutilized in 1977. The Leninogorsk complex did not produce the planned amount of metals in concentrates, and the planned target for ore extraction at the Tishinsk mine of this complex was not obtained in 1977. Work indicators at the Chimkent lead plant were the lowest in the branch.[72]

The first section of the Zhezkent mining and concentration complex and the second section of the Novo-Berezovsk mine in Kazakhstan were put into operation. Ore extraction capacities were enlarged at the Leninogorsk and Irtysh polymetallic complexes and the Zyryanovsk and Tekeli lead and zinc complexes. At the Ust'-Kamenogorsk lead and zinc complex, capacity for production of zinc was enlarged. At the underground mines of many enterprises, including the Leninogorsk, Irtysh, and Almalyk polymetallic complexes and the Zyryanovsk lead complex, self-propelled equipment was underutilized.

In the Urals, the second largest zinc-producing region, slow development of the mines resulted in shortages of ores at the

Digitized by Google

concentration plants. During 1966-75, the recovery of zinc from copper-zinc ores at the Urals deposits grew 7.1% and zinc concentrate output increased 150%. During the same period, output of zinc concentrate at the Sredneuralsk mining and metallurgical complex increased 140%.

The second stage of the Sadovyy mine of the Dalpolimetal (Far Eastern Polymetallic) Association in Primorsk Kray was commissioned in 1977. When the mine reaches its full capacity, the Primorsk complex will increase extraction of lead and zinc ores by 50%. Blueprints for the first stage of the Gorevo mining and concentration complex in Irkutsk Oblast' were drawn up in 1977. The lead and zinc deposit lies below the bed of the Angora River.

One of the largest Soviet zinc plants, at Almalyk in Uzbekistan, overfulfilled its 1977 production target. The Sadon lead and zinc mining and concentration complex in North Caucasus operated the Sadon, Zgid, Arkhip, Kholstin, and Fiagdon mines in 1977. The lead and zinc ore of the Kuru-Say deposit in Tadzhikistan is mined at a depth of 650 meters.

Magnesium.—Five magnesium plants, with an estimated combined annual capacity of 73,000 tons, produced 65,000 tons in 1977, 3% more than in 1976. Exports of metal increased from 11,380 tons in 1975 to an estimated 20,000 tons in 1977. Production and consumption of rolled metal in the U.S.S.R. is small.

During 1971-75, production of magnesium and its alloys at the Ust'-Kamenogorsk complex increased 13.8%. In 1976, the output of metal increased by 0.6% over the 1975 level, and it was planned to increase production by 5.3% in 1978. Production of magnesium and its alloys at the Berezniki complex increased 56.3% over the 1966-76 period. During the 1976-80 plan period, capacity for production of magnesium was to be increased.

Manganese.—The Soviet manganese industry remained the largest in the world, with an estimated output of 8.5 million tons of marketable ores (2,940,000 tons of metal content), or 1% less than that of 1976. About three-quarters of the total came from the Nikopol' Basin in the Ukraine, and the rest from the Chiatura Basin in Georgia. Some 300,000 tons of crude ore were produced in Kazakhstan. Exports of manganese ore decreased from 1.5 million tons in 1974 to 1.4 million in 1975 and to 1.3 million tons in 1976.

The principal Soviet manganese basin, the Nikopol' in the Ukraine, has reserves many times greater than the Chiatura, but the ore is little more than 2 meters thick and lies under some 80 meters of overburden. In 1977, 18 underground mines, 10 open pits, and 8 concentration plants were in operation in this basin, with more than 75% of the ore coming from open pit operations. The Nikopol' basin ore averages 26.4% manganese. Concentration by gravity and agglomeration yielded a recovery of 71% to 75% with 45- to 48-percent-manganese concentrates; the balance contained about 34%.

The Chiatura Basin in Georgia, the richest Soviet manganese area, produced about 2.5 million tons of concentrates in 1977 from 23 underground mines and open pits and 8 concentrators. Over 80% was extracted from underground mines. Of the total beneficiated, 66% contained 48.7% Mn, and the rest 25.6% Mn. Development of four small mines continued in 1977. They are to be commissioned during 1978-80.

Mercury.—Output of mercury was estimated at 58,000 flasks (76 pounds each), and the U.S.S.R. was apparently self-sufficient in 1977. There are numerous deposits mainly in Central Asia, the Soviet Far East, and the Ukraine. The Khaydarkan complex in the south of Kirgiziya, the largest Soviet mercury operation, had four mines and a recovery plant in operation in 1977. At this complex, mercury is mined by both underground and open pit methods. Sinking of the 850-meter Tsentralnaya shaft of the Ulug-Too mine at this complex continued in 1977. The renovation of metallurgical facilities at the Khaydarkan complex continued in 1977 and was scheduled for completion in 1980.

The Nikitovskiy complex in the Ukraine, where over 70% of the ore is mined by underground and about 30% by open pit methods, is the second major producer of mercury. Two underground mines (2-bis Novaya and Novo Zavodskaya) and the Polukupol Novvy open pit were in operation at this complex in 1977. The small Zakarpatskiy mercury complex processes ores from the Borkutnoye, Shayanskoye, and other small deposits in Zakarpatskaya Oblast', West Ukraine.

In 1966-75, the extraction of mercury ore in Tadzhikistan nearly doubled. Construction of the new Dzhidzhikrutskiy (Aznob) mercury-antimony complex in this Republic continued but completion of the first stage was rescheduled for 1980 from 1976. The

Digitized by Google

Shorbulag, Agyatag, and Levskoye are small mercury deposits mined in Azerbaydzhan. It was planned to start development of new small deposits in Magadan Oblast'. Exploration of the small Tamvatney mercury deposit in the Soviet Far East continued slowly.

Molybdenum.—Output of molybdenum concentrates was estimated at 9,700 tons (metal content), 4% above that of 1976. Reserves of molybdenum in ore (molybdenite, copper-molybdenum, and tungsten-molybdenum ores) in the U.S.S.R. may approach 200,000 tons. About 50% of the production is based on copper-molybdenum ores from Armenia, Kazakhstan, Sorskoye, and Siberia; over 30% is from the tungsten-molybdenum ores of Tyrny-Auz (Kabardin A.S.S.R. in the North Caucasus) and Dzhida (Buryat A.S.S.R.); the remainder arises from molybdenite ore mined in Uzbekistan and Siberia.

Armenia is the largest producer of molybdenum concentrates from copper-molybdenum ores, but the concentrate is shipped out of the Republic for further treatment. The Kadzharan and Kafan copper-molybdenum complexes, which became the part of a new enterprise, the Zangezur complex, in 1977, supplied over 25% of Soviet molybdenum in 1977. However, there are shortages of ore reserves at the Kafan and Agarak mining and beneficiation complexes.[73] In 1976, the extraction of molybdenum at the Kadzharan and Agarak beneficiation plants increased as compared with 1973 by 0.97% and 4.47%, respectively. In the last 4 years, the content of molybdenum in processed ore decreased at the Kadzharan concentrator by 0.0025%. The planned recovery of molybdenum in concentrate (83%) at Kadzharan was attained in 1977.

The Sorskiy molybdenum mining and concentrating complex in Krasnoyarsk Kray was the largest producer in 1977. The Tyrny-Auz tungsten-molybdenum complex, which operates the Molibden underground mine and the Mukulanskiy open pit, was undergoing enlargement in 1977. Output of ore at the Mukulanskiy open pit increased. The Chorukhdayransk concentrator processed copper-molybdenum ores from the Chorukhdayransk and South-Yashransk deposits in Tadzhistan.

Nickel.—With an estimated 142,000 tons of smelter production, 5% more than in 1976, Soviet nickel output was second only to that of Canada. During 1966-75 output of nickel increased 94%, and it was planned to increase metal production by 20% to 30% in 1980 compared with that of 1975. Production is estimated at a probable 150,000 tons in 1978 and 165,000 tons in 1980. Sulfide ores are mined at Norilsk in Krasnoyarsk Kray (East Siberia) and in the Pechenga-Monchegorsk area in the Kola Peninsula. Oxide ores are produced in the Aktyubinsk area of the Southern Urals, the Ufaley area of the Central Urals, and the Ukraine. The centers of production, in order of importance, continue to be Norilsk, the Urals, and the Kola Peninsula. Of the seven smelters in operation, Norilsk is the most important; the Ufaley, Rezh, and Khalilovo smelters in the Urals comprise a close second; the Monchegorsk and Pechenga smelters are third; and the Pobuzhsk ferronickel plant in the Ukraine is fourth. In the future, the Soviet Union will be an important nickel exporter, based on both Soviet and Cuban concentrates.

The Norilsk complex in East Siberia is producing copper, nickel, cobalt, platinum-group metals, selenium, and other rare metals. The recent expansion there has been rapid. During the 10 years prior to 1977, production of ore at Norilsk increased by a factor of 3 and metal output by a factor of 2.5. It was planned to construct the first stages of the No. 2 concentrator and Nadezhda smelter by the end of 1980 and to develop additional mining facilities. The new facilities were to increase capacities for production of nickel by 80%, copper capacity by 70%, and cobalt capacity by 160%.

The fourth stage of the Oktyabr' mine at Norilsk was put into operation in April. A 1,200-meter shaft was sunk at this mine, which has high-grade ore and is one of the largest in the nonferrous industry. It is the deepest in the Polar region and the industry's most highly mechanized. Sinking of a 1,500-meter shaft at the Taymyr mine of the Norilsk complex began in December. It is the third shaft at this mine. It was planned to complete development of the Oktyabr' mine and renovation of the Zapolyarnyy and Komsomol'skiy underground mines by the end of 1980.

The electric furnace at Norilsk, one of the biggest nonferrous units in the country, went into operation after renovation in July. Construction of the Nadezhda copper and nickel plant at Norilsk continued in 1977. The equipment was supplied by a Finnish company. The annual capacity of the nickel plant is to be 550,000 tons of

Digitized by Google

nickel concentrate (100,000 tons of nickel). The first stage, originally scheduled for completion in 1974, was initially rescheduled for 1977 and later for 1980. Autoclaves are to be used for the first time.

The ores at the Severonickel complex at Monchegorsk are mined by both open pit and underground methods. The Zhdanovskiy complex is the largest operation in this area. Four small underground mines (Kaula, Kotselvaara, Kammikivi, and Northern) and two small open pits (Kaula and Kammikivi) were in operation at the Pechenganikel complex. The No. 1 truck tunnel at the Northern mine was put into operation in 1977, and the No. 2 tunnel there was being drifted. During 1978-80, it was planned to install new mining and metallurgical facilities at the association "Nikel" (Severonokel and Pechenganikel complexes), to be operated by 3,000 workers. Oxide ore is mined at the Promezhutochnoye, Novo-Burenovskoye, Oktyabr'skoye, and other deposits.

The U.S.S.R. is financing a $600 million expansion of Cuban nickel production, with output of 90,000 tons per year scheduled for 1985. The key elements of the Soviet program to expand nickel production in Cuba by renovation of existing plants and construction of a new plant appear to include expanding production of the Nikaro plant from 18,000 to 22,500 tons per year by 1980, expanding production of nickel at the Moa plant from 18,000 to 24,000 tons per year, and constructing two 30,000-ton-per-year nickel-cobalt oxide plants within 8 kilometers of the Moa plant.

The first new plant (Punta Gorda) is scheduled for completion by 1983-84, and the target date for the second is 1985-86.

Platinum.—The U.S.S.R. remains the largest producer and exporter of platinum-group metals, supplying 20% to 25% of international exports of platinum and more than 50% of world consumption of palladium and rhodium. The U.S.S.R. is steadily expanding its platinum-group metals output with 1977 production estimated at 2.9 million ounces, about 4% over that of 1976. Ore reserves are adequate to maintain current production for many years, with increased exports. The 1976-80 plan calls for platinum-group metals output at Norilsk to rise by about 80% over that of 1975. But slow construction of the Nadezhda plant will limit Soviet primary production increases to an annual rate of 4% to 5%. Production of platinum and platinum-group metals may reach 3.05 million ounces in 1978 and 3.30 million ounces by 1980.

Production of platinum and platinum-group metals comes principally from the Norilsk copper and nickel complex in Krasnoyarsk Kray, the Severonikel and Pechenganikel complexes ("Nikel" association) on the Kola Peninsula, and several small placer deposits in the Urals. Virtually all platinum-group metals were produced as byproducts with about 75% coming from Norilsk. The high priority given to the Norilsk development suggests that the Soviets are determined to proceed with increased production of platinum and platinum-group metals despite high costs imposed by the harsh northern climate. Expansion is expected to accelerate in a few years, with completion of the Oktyabr'skiy underground mine, the No. 2 concentrator, and the first stage of the Nadezhda smelter. The mine had been under development in six stages since 1969 with completion scheduled by 1980. The fourth stage was put into operation in April 1977, and stages five and six were in progress.

In 1977, the U.S.S.R. was in need of foreign exchange to meet the cost of its grain purchases from Western countries. The high level of Soviet indebtedness to the West is an additional reason for a major export drive of platinum-group metals and gold. The U.S.S.R. hoped to sell at least 250,000 ounces of Olympic platinum coins to Western collectors between 1977 and 1980. Reportedly, the United States plans to increase stockpiling of platinum from 453,000 ounces to over 1.3 million ounces. A large proportion of U.S. strategic stockpile will come from the Soviet Union, which will try to increase price in the future. The United States and Japan are the major importers of Soviet platinum-group metals.

Silver.—Output of silver was estimated at 45 million ounces, 2.2% above that of 1976. Almost all silver is produced as byproduct from nonferrous operations, with production mainly centered in the Soviet Far East, Kazakhstan, East Siberia, the Urals, and Armenia. During the year, 14 gold treatment plants extracted silver, as did the Norilsk complex in Krasnoyarsk Kray and some of the Kola copper-nickel enterprises.

The recovery of silver at beneficiation plants in the Urals ranges from 15% to 50% from complex ores containing 6 to 15 grams per ton of silver. The silver content in Soviet lead concentrates fluctuates from 680 to 860 grams per ton. During 1967-1977,

Digitized by Google

recovery of silver at the Sredneural'sk copper plant increased 4%. In processing 1 ton of lead-zinc ores, about 200 grams of silver is obtained.

The ash of 1 kilogram of burned Soviet photographic film contains almost 0.2 gram of silver. The Riga secondary precious metals plant increased production of secondary silver in 1977. The silver shop at this plant existed since 1969. During 1970-77, it increased its output of secondary silver several times.

Tin.—Although the Soviet tin production policy is based on self-sufficiency at any price, output continued to be inadequate and about 20% of requirements had to be imported in 1977. Primary tin production in 1977 was estimated at 32,000 tons, 3.2% over that of 1976. The Soviet Far East, Yakutia, and Transbaykal were the main tin producers. The Maritime Kray is the largest producer, and the Khrustal'nyy complex, which operates both lode and placer deposits, is the largest enterprise there. Output of tin may reach 33,000 tons in 1978 and 35,000 tons by 1980. Most new production will come from existing or currently developing mines in the Soviet Far East and Central Asia.

The Khrushtal'nyy complex operated the Khrushtal'nyy, Ege-Khaya, Imeni Lazo, Kholodnyy, and Alyaskavity mines in 1977. The Ternistyy and Arsen'evskaya mines of this complex, which were scheduled for completion in 1975, were still under development in 1977 and have now been rescheduled for completion in 1980. The metal content of the ore is 0.18% to 0.91% at the Arsen'evskaya mine and 0.87% at the Valkumey mine in Magadan Oblast'. The thickness of the veins at the Arsen'evskaya and Valkumey mines in Magadan Oblast' is 0.63 to 0.64 meter.

Development of the Starodubov open pit at the Khinganolovo (Khingan tin) complex at Birobidzhan, Jewish Autonomous Oblast', Khabarovsk Kray was completed in 1977. It has enough reserves for 15 years of operation. Production of ore at Molodezhnyy and Pereval'nyy mines at this complex increased in 1977. The Deputatskiy complex in Yakutia and Sherlovgorskiy in Transbaykal continued to operate in 1977, while the Uchkoshen, Ilintas, Alys-Khaya, Ege-Khaya, and Burgochan deposits were under detailed exploration. Ore grades at Uchkoshen deposit range from 0.80% to 1.32%.

Three known tin refineries operated in the U.S.S.R. in 1977: Novosibirsk (the largest), Ryazan', and Podol'sk (near Moscow). It was planned to increase output of metal at the Sherlova Gora, Ege-Khaya, Leningrad, Sinancha, and other smelters. Output of secondary tin in 1977 was estimated at 12,000 tons, 9% above that of 1976. Construction of a tin-processing unit at the Rustavi secondary nonferrous metals plant in Georgia continued in 1977.

Reportedly, the U.S.S.R. bought about 4,500 tons of Bolivian tin worth more than $50 million for shipment in 1978. The Soviet-built volatilization plant at Palca near Potoci in Bolivia was reportedly running 6 months behind the earlier projected opening of April 1978.

Titanium.—Titanium production in 1977 was estimated at 35,000 tons, 9% over that of 1976. Development of the titanium industry continued to be based mainly on Ukrainian and Siberian ilmenite and rutile. During 1966-76, the output of titanium was increased by 150%. The 1976-80 plan for development of the titanium-magnesium industry emphasized renovation of equipment at the existing plants. Production of titanium was programed to be raised by 40% in the 1976-80 period. Estimated output for 1978 and 1980 was 37,000 and 42,000 tons, respectively.

The output of titanium sponge at the Berezniki complex in the Urals was increased by 150% in 1966-76 and by 75% in 1971-75. During the 1971-75 period, production of titanium sponge at the Ust'Kamenogorsk complex in Kazakhstan increased 41%, and recovery of metal from raw materials increased 4.7%. Output of titanium sponge at this complex was planned to be raised by 7.7% in 1978 over the 1977 level. Soviet reserves of TiO_2 have been estimated at about 10 million tons, contained in 70 million tons of ore averaging 10% to 20% TiO_2.

The most important sources of ilmenite are placer deposits on two right-bank tributaries of the Dnieper River in the Ukraine. Major producers continue to be the Samotkanskoye zirconium-titanium alluvial deposit and the Volchanskoye titanium deposit in Dnepropetrovsk Oblast'; the Irshanskoye, Streminogorskoye, and Zelenogorskoye titanium deposits in Zhitomirskaya Oblast'; and the Tarasovskoye deposit in Kiyevskaya Oblast'.

Two complexes, the Irshanskiy mining and beneficiation complex, where dredges

Digitized by Google

are used for ilmenite extraction, and the Verkhnedneprovskiy complex, are the main raw material suppliers for the Soviet titanium industry. Four stages of the Irshansk concentrator were in operation in 1977.

Reportedly, the Soviet Union was planning to build the Armansk No. 2 titanium dioxide plant in the Crimea. The project, with an annual capacity of 100,000 tons, is to be one of the world's largest titanium dioxide plants. The contract value is to be over £100 million. This plant will be the second in Armansk; the first one, with a capacity of 30,000 tons per year, was built by Techmont using technology supplied by its parent company, Montedison.

Tungsten.—Production of tungsten in concentrates was estimated at 8,200 tons, 2.5% more than in 1976, with the North Caucasus, Kazakhstan, Uzbekistan, Transbaykal, and the Soviet Far East continuing as the principal producing centers. Production of tungsten was insufficient to satisfy growing domestic needs, and about one-third of the concentrate requirements were imported. Although most of the deposits in the U.S.S.R. are of low grade, its production is second to China, the world leader. The large deposit in the North Caucasus, the Tyrny-Auz deposit, contains both molybdenum and tungsten. The largest deposits in Kazakhstan are the Verkhne-Kayraktin tungsten and Akchatau molybdenum-tungsten deposits. There are considerable reserves of tungsten at the Ingechke deposit in Uzbekistan and the Jidda deposit in Siberia. Production is estimated at 8,400 tons in 1978 and 8,700 tons in 1980.

The main producer of tungsten concentrates is the Tyrny-Auz tungsten and molybdenum complex in the North Caucasus, where both underground and open pit methods are used. The Iultin complex, the only tungsten mining enterprise in Magadan Oblast', eliminated its shortfall after a long period of underfulfillment of production quotas. The Chorukh-Dayronsk deposit in Tadzhikistan is almost completely depleted and has been replaced by the Yubilennoye deposit, which was put into operation recently. The first stage of the Primorsk complex in Maritime Territory, based on the Vostok-2 tungsten deposit, was commissioned in August. Development of the Yakhtonsk deposit in Uzbekistan and examination of the Maykhurinsk tin and tungsten deposit in Tadzhikistan were completed in 1977. The deposit contains about 1% WO_3.

Reportedly, the tungsten concentrate price continued to rise in 1977. The Comecon countries, and the Soviet Union in particular, were the main purchasers in 1977. The China-U.S.S.R. supply and price relationship has been a significant factor in recent price escalation.

Vanadium.—The Soviet Union, with large vanadium resources, is becoming an important producer and exporter. The principal source in 1977 continued to be vanadium-rich slag, a coproduct with iron from the titaniferous magnetites of the Kachkanar open pits in the Urals. However, the metallurgical problems of vanadium recovery have not yet been satisfactorily resolved. The Nizhniy Tagil metallurgical complex and the Chusovskoy metallurgical plant in the Urals are the enterprises that produce raw material for the production of vanadium and its alloys. Nizhniy Tagil, where the vanadium slag is produced from 130-ton oxygen converters, is the only modern enterprise. The vanadium content of the pig iron at Chusovoy is 0.54%, and that at Nizhniy Tagilii is 0.45%. After devanadization of the pig iron, the average V_2O_5 content of the slag at Chusovoy is 17.2% and that at Nizhniy Tagil is 21.2%.

The enlargement of facilities at the Kachkanar ore mining and concentration complex, from 33 million tons of crude ore to 40 million tons, and the processing of vanadium at the Nizhniy Tagil metallurgical complex have made it possible to increase the output of vanadium products considerably. The special vanadium unit of No. 2 shop at the Ust'Kamengorsk titanium-magnesium complex in Kazakhstan, which was commissioned in 1976, began byproduction of vanadium in 1977.

It is planned to develop the Kachkanar No. 2 and to increase production of vanadium in the future. It is also planned to construct special units at some alumina plants for the recovery of vanadium pentoxide as a byproduct from bauxite and other raw materials.

Minor Metals.—The Soviet Union possesses commercial deposits of all the rare metals that have assumed importance in modern rocketry, aircraft, and nuclear energy. However, extraction of many of them remains low. The main deposits are in Kazakhstan, the Kola Peninsula, Uzbekistan, Armenia, the Urals, the Ukraine,

Digitized by Google

Norilsk, Transbaykal, and the Soviet Far East.

As late as 1927, the U.S.S.R. produced only three rare elements: uranium, radium, and selenium. There is evidence that by 1940 there was at least a small-scale production of beryllium, lithium, rare earths and cerium, thorium, uranium and radium, zirconium, cadmium, selenium, tellurium, and strontium. In 1947, the Soviets announced that "in the U.S.S.R. at the present time there is no such chemical element for which there had not been discovered a commercial deposit or a source of practical extraction from a complex mineral raw-material."[74] A great deal of the deposits, no doubt, would have been classified in the United States as submarginal. In the Soviet Union some of these ore bodies might be considered of commercial grade.

The primary sources of rhenium are molybdenite from copper-molybdenum deposits of Armenia, Kazakhstan, and East Siberia. Byproduct rhenium is recovered at the Balkhash and Dzhezkazgan complexes in Kazakhstan, at the Kadzharan copper-molybdenum complex in Armenia, at the hard-alloy plant in Uzbekistan, and at some other plants.

Selenium and tellurium are frequently found together in the base metal sulfide ores. Direct selenium production in the U.S.S.R. started in 1928 from copper-zinc operations in the Urals, and later from lead-zinc deposits in the Altay region and from copper-molybdenum deposits in Armenia, Kazakhstan, and Siberia. Although most of the Ural selenium-bearing deposits contain small quantities of tellurium, production of the latter did not start until much later.

The selenium content in the copper-molybdenum ores of Armenia fluctuates from 3.6 to 10.5 grams per ton and that of tellurium from 1.5 to 6.2 grams per ton. Copper concentrates of Armenia contain 46 to 110 grams per ton selenium and 18 to 62 grams per ton tellurium. There are 110 grams of selenium and 40 grams of tellurium per ton in the charge of the Alaverdy metallurgical complex in Armenia. It is necessary to process 22.5 tons of charge at Alaverdy for recovery of 1 kilogram of selenium and 90.2 tons for recovery of 1 kilogram of tellurium. Extraction of selenium and tellurium at the Alaverdy complex increased in 1977.

According to available Soviet literature, production of indium, germanium, and gallium took place in the U.S.S.R. at the end of 1939 as byproducts from lead-zinc operations in Kazakhstan. Small quantities of germanium have occurred in the ash of some coals and in the tar of some Soviet coking coals. Gallium in concentrations of up to 0.1% was established with muscovite in pegmatite veins of Central Asia. Production of gallium increased at the Chimkent lead plant in Kazakhstan in 1977.

The Soviets claim the world's largest deposits of columbium and tantalum within the limits of the Lovozero massif in the Kola Peninsula. There were two underground mines, the Karnasurt and Umbozero, in operation at Lovozero in 1977. Smaller columbium- and tantalum-bearing deposits are found in the Urals, the Ukraine, the Caucasus, and Transbaykal. The Soviet ilmenite concentrates contain at the average 0.12% Nb_2O_5 and 0.008% Ta_2O_5.

Production of five byproduct minor metals has been started recently at nonferrous metallurgical enterprises in Kazakhstan. Facilities for extracting scandium have been constructed at the Ust'-Kamenogorsk titanium and magnesium complex, and a unit for production of gallium has been put into operation at the Pavlodar alumina plant. A new production shop for recovering minor metals has also been built at the Dzhezkargan metallurgical complex.

NONMETALS

The Soviet Union produces a wide variety of nonmetallic minerals. However, the resource position varies from an adequacy for many nonmetallic minerals to an apparent shortage of others such as barite, fluorspar, mica, and talc.

Asbestos.—The Soviet asbestos industry remains the largest in the world, with an estimated output of the seven grades at 2.46 million tons in 1977. Over 62% of the total production came from the Uralasbest complex, about 28% from Dzhetygara in Kazakhstan, and about 10% from the Tuvaasbest complex in Tuva A.S.S.R. Exports rose from 385,000 tons in 1970 to an estimated 600,000 tons in 1977, with about 60% going to Western markets. In spite of the asbestos export expansion in recent years, the domestic deficit was expected to be about 100,000 tons in 1977.[75] Estimated output for 1978 and 1980 is 2.50 million tons and 2.56 million tons, respectively.

Development in the asbestos industry has been concentrated in the Urals, Kazakhstan, and Tuva A.S.S.R. Three open pits at Uralasbest produced over 37 million tons of crude ore and dumped over 94 million tons

Digitized by Google

of overburden in 1977. It is estimated that mining of crude ore and overburden will be increased from 131 million tons in 1977 to about 150 million tons in 1980, but production of marketable asbestos is expected to remain unchanged at about 1.54 million tons because of the decreasing ore grades. The old No. 3 concentrator, with an annual capacity of 120,000 tons of marketable ore, is now obsolete and is to be replaced by a new No. 7 plant.

In Kazakhstan, a large complex has been organized for developing the Dzhetyyara deposit in Kustanay Oblast', which is the second largest in the Soviet Union. The first mill at this complex, with an annual capacity of 200,000 tons, was commissioned in 1965. This mill was renovated in 1971-75, and production increased from 259,000 tons in 1970 to an estimated 360,000 tons in 1977. The Dzhetygara No. 2 mill, with an annual capacity of 400,000 tons, was completed in 1975 and produced an estimated 320,000 tons in 1977. Total output at the Dzhetygara complex will be increased from 680,000 tons in 1977 to an estimated 760,000 tons in 1980.

The first mill of the Tuvaasbest complex, with an annual capacity of 20,000 tons, was put into operation in September 1964. This mill produced over 60,000 tons in 1977. The second mill, with a capacity of 195,000 tons per year, was commissioned in April 1976; estimated production from this mill was 180,000 tons in 1977. It was planned to produce 250,000 tons at Tuvaasbest in 1977. Total output at this complex was to increase from an estimated 240,000 tons in 1977 to planned 265,000 tons in 1980. During 1965-77, the Tuvaasbest complex produced over 500,000 tons of asbestos.

Development of the Kiembay deposit in Orenburg Oblast' (Southern Urals) was started in 1968 and continued in 1977. Seven Comecon members are assisting in the completion of this project, which calls for a total contribution of 106.2 million transferable rubles from the six East European member countries. The total cost of the project is 300 million rubles.

The design capacity of the Kiembay project is 500,000 tons per year of grade III through VI from 24 million tons of ore with an average grade of 4.4%. The complex is to be completed in two equal stages. The first was to be completed in 1979, and its output will be shared among the Comecon members in proportion to their contribution. The Soviet Union will supply asbestos to Comecon countries over a 12-year period starting in 1980. In terms of volume, this represents about half the planned production capacity for each year of the agreement's validity, which can be extended for a further 10 years beyond 1991.

Exploration of the Sayan asbestos deposit on the border of Krasnoyarsk Kray and Tuva A.S.S.R. was completed in 1977, and the reserves are estimated at 7 million tons of asbestos. A mining and beneficiation complex, with an annual capacity of 200,000 tons, is to be built there. The asbestos lies at a comparatively shallow depth and will be mined by opencast methods. When the complex is put into operation it will reduce the U.S.S.R.'s asbestos shortage. By the end of the 1976-80 period, the surveyed reserves of asbestos in the Tuva A.S.S.R. are to increase to 10 million tons.

Barite.—Barite is mined by both open pit and underground methods and, at many operations, crude output is concentrated by flotation. Estimated domestic production in 1977 totaled 450,000 tons, a 12.5% increase over 1976 output. About 60% of the country's barite consumption in 1977 was produced domestically; the balance is filled by imports of high-grade barite, mainly from North Korea, Yugoslavia, and Bulgaria. The main centers of barite output continue to be Georgia, Kazakhstan, and West Siberia. Small deposits have been developed in the Urals, Azerbaydzhan, Armenia, and other regions. Over 30% of Soviet barite reserves are located in Georgia, which produced over two-thirds of the 1977 output. Construction of a 45,000-ton-per-year complex in Khaishi in Svanetia, Georgia, and development of the underground mine at the Zharemsk polymetallic complex in Kazakhstan continued in 1977. The increased output in 1977 was attributed largely to the growth of barite recovery at beneficiation plants of the Achisay, Irtysh, Karagaylin, Tekeli, and Akchataur polymetallic and the Maykan gold complexes in Kazakhstan.

Diamond.—The U.S.S.R. continues to make progress in expanding its diamond industry, which is centered in Yakutia where about 20 deposits have been discovered. In 1977, output was estimated very roughly at 8.2 million carats of industrial quality and some 2.1 million carats of gem quality. Production of diamonds is estimated at a probable 10.5 million carats in 1978, 10.8 million in 1979, and 11 million in 1980. Next to fossil fuels and precious metal exports, diamonds account for the largest share of the Soviet Union's overall foreign

Digitized by Google

currency earnings.

Production in the Yakut A.S.S.R. started at a small plant in 1957. In January 1978, the industry consisted of the Mirnyy open pit with five concentrators, the Aykhal open pit and concentrator, the Udachnaya placer mine and concentrator, and the Irelyakh placer mine with two dredges. Small quantities of gem and industrial stones are produced from the Vishera River Region in Perm Oblast' (western Urals), where four dredges and two separation plants were operated at two placer deposits in 1977. Enlargement of the Udachnyy mining and concentration complex is nearing completion. About forty 75-ton Bel AZ 549 dump trucks are in use at the Udachnaya open pit for ore and overburden. This pit is the second mining enterprise (after the Mirnyy open pit) in the country to use these trucks. The town of Udachnyy is being built at the diamond deposit at the edge of the Polar Circle.

Gem stones are being cut at Leningrad, Sverdlovsk, and Smolensk. Sales of cut stones are rising steadily, and substantial increases are expected by 1980. The U.S.S.R. has arranged to market part of its diamond output in Antwerp through a newly formed Soviet-Belgian company in which the Soviet export organization, Almazyuvelirexport, has the controlling interest. The U.S.S.R. State Committee for Science and Technology has signed an agreement with a Belgian company on scientific and technical cooperation in the production and use of diamond tools.

A substantial but unknown quantity of synthetic diamond was also produced in 1977 by plants in Kiyev, Yerevan, Moscow, Tashkent, and Poltava.

Fertilizer Minerals.—Production totaled 23.2 million tons in nutrient content or 96.7 million tons (planned quotas of 98.5 million) in bulk fertilizer content,[76] an increase of 5% over 1976 output. This increase was obtained mainly through the commissioning of new facilities. In 1977, plant capacities were expanded by 4 million tons of fertilizers (Soviet standard) per year, although the planned quota for construction of new facilities was not met. It is estimated that nitrogen fertilizers constitute about 38%; potassium fertilizers, 37%; phosphate fertilizers, 21%; and phosphate flour, 4%.

The breakdown of mineral fertilizer production in nutrient content by commodity is given in the following tabulation, in thousand tons:

Fertilizers	Reported			Estimated
	1970	1975	1976	1977
Nitrogen	5,423	8,535	8,609	8,900
Potassium	4,087	7,944	8,310	8,500
Phosphate	2,500	4,452	4,833	5,000
Phosphatic flour	1,085	1,059	831	800
Unspecified	4	8	7	--
Total	13,099	21,998	22,590	23,200

Source: Narodnoye khozyaystvo S.S.S.R. za 60 let (National Economy of the U.S.S.R., 60 years). Moscow, 1977, p. 213.

There was an increase in exports of mineral fertilizers. Despite substantial production and large exports, fertilizers did not meet domestic demand. A high percentage of superphosphate and potassium fertilizers was not granulated, and great difficulties were experienced in commissioning some new projects and attaining planned capacity of facilities. Reportedly, the 10-year agreement between the U.S. company, Agrico Chemical, and the U.S.S.R. provides that the Soviet Union would supply Agrico with 1 million tons of potash annually in exchange for about 250,000 tons of triple superphosphates.

Soviet exports of mineral fertilizers is shown in the following tabulation, in thousand tons (Soviet standard):

Fertilizers	Reported			Estimated
	1970	1975	1976	1977
Phosphate	518.3	529.9	533.2	535.0
Potassium	5,579.9	5,985.6	5,566.8	5,600.0
Nitrogen	1,520.6	1,311.7	1,693.9	1,700.0
Apatite concentrate	5,994.7	5,830.1	e5,900.0	5,900.0

eEstimate.

Sources: Vneshnyaya Torgovlya S.S.S.R. (Foreign Trade of the U.S.S.R.), Moscow. Statistical Handbooks. 1974, 1975, 1976.

Over 97% of fertilizers were shipped by railroad, mostly in bulk, causing loading losses, moisture penetration, and difficulties in loading and unloading. Unloading takes place at almost 7,000 railroad stations with the use of manual labor. As a result, about 10 million tons of fertilizers are lost each year.[77]

The growth of the Soviet mineral fertilizer industry is one of the priorities of Soviet planners. The 1976-80 plan envisages output of 143 million tons in bulk (32 million tons of nutrients) in 1980, 60% over the 1975 level. During 1976-80, 55.4 million tons per year of new fertilizer capacity is to be

Digitized by Google

commissioned. It is planned to invest 12,700 million rubles into construction, renovation, and expansion of fertilizer facilities, or twice as much as in 1971-75. The Apatit and Karatau main phosphate-producing centers will be expanded, and exploitation is to begin at the Chilisay deposit in Aktyubinsk Oblast', Kazakhstan. The 1978 plan called for completion of 15.9 million tons of new fertilizer capacity, compared with 4 million tons in 1977. The U.S.S.R. continued to experience difficulties in completing fertilizer industry projects on schedule because of shortages of material, equipment, and labor, and organizational problems.[78] This will hinder the achievement of the 1980 production target of 143 million tons. Estimated production for 1978 and 1980 is 101 million tons (Soviet standard) and 130 million tons, respectively.

In 1977, new facilities for mineral fertilizer production were commissioned at the Balakovo chemical plant and the Ionava nitrogen fertilizer plant. Construction of a 2,130-kilometer ammonia pipeline has started in the U.S.S.R. with the assistance of United States, French, and West German firms. The pipeline will connect three new ammonia plants now under construction in Togliatti, Gorlovka, and Grigoryev near Odessa with a new port being constructed on the Black Sea coast. The liquefied ammonia will be exported as a part of the Soviet-West fertilizer compensation deal. An agreement for shipment of ammonia to the U.S.A. was signed in 1976 between the U.S.S.R. and the Occidental Petroleum Co.

During 1976-80, equipment for 23 new ammonia plants, each with a capacity of 450,000 tons, was to be supplied by Western companies. All these plants were to be constructed in the U.S.S.R. with the assistance of Toyo engineering (15 plants), Chemico (4 plants), and Creusot-Loire (4 plants). The following seven ammonia plants were scheduled for completion in 1976-77: Berezniki, Chernorechye, Ionova, Kuybyshev, Nevinnomysk, Novokemerovo, and Severodonetsk. The other 16 ammonia plants to be put into operation in 1978-79 were: Cherepovets, Cherkassy, Dorogobush, Dnewprodzerzhinsk, Gorlovka (2 plants), Grodno, Novgorad, Novomoskovsk, Odessa (2 plants), Rossosh, and Togliatti (4 plants).

An agreement between the Soviet Union and the French engineering firm, Speichim, worth F460 million, has been signed for the construction of three 800,000-ton-per-year complex fertilizer plants to be constructed in Novyy Rozdol, Belorechensk, and Meleuz. The plants will produce 17-17-17 NPK material. Reportedly, large tonnages of Soviet ammonia are headed for Western Europe as a result of compensation deals with Creusot-Loire of France, Montedison, Anic, and Mitsui.

Phosphate.—Estimated output of phosphate rock totaled 76 million tons in 1977, including 41 million tons of apatite ore (17% P_2O_5) and 35 million tons of sedimentary rock (13% P_2O_5). The main centers continued to be the Apatit Association on the Kola Peninsula and phosphate deposits at Karatau in Kazakhstan. Deposits of phosphorites also occur in Upper Kama in the Urals, at Egor'evsk and Lopatino in Moscow Oblast', at Kingisepp in Leningrad Oblast', and in some other regions, but the P_2O_5 content is rather low. Generally, they produce phosphorite flour with about 19% P_2O_5.

The phosphate measured, indicated, and inferred reserves in place were estimated in 1977 at 2,717 million tons of phosphorite (overall average grade 13% P_2O_5) and 2,700 million tons of apatite (average grade 17% P_2O_5) in the Khibiny (Kola Peninsula) and 870 million tons (average 4% P_2O_5) at the Oshurkovo deposit in the Transbaykal. Reserves of apatite, totaling 50 million tons, have been confirmed in the Koashva deposit of the Khibiny Mountains.

Because the P_2O_5 content in the ores is declining, a sizable increase in the ore consumption per ton of P_2O_5 is expected. While in 1970, it was 11.7 cubic meters per ton, this indicator should reach 17.2 cubic meters per ton in 1980 and 25.4 cubic meters per ton at new deposits.

Capital construction will play a significant part in the development of the mining and processing facilities in the current plan. A total of 1,120 million rubles will be used, 57% more than in 1971-75. The major part (94%) is allocated for modernization, renovation, and expansion of the existing enterprises in the apatite-phosphorite mining and processing industry; only 67 million rubles (6%) is allocated for construction of new enterprises.

The Khibiny apatite-nepheline deposits are the largest single phosphate source. Mined ore, averaging 16% to 21%, is upgraded to 39.4% P_2O_5 with 92% recovery. The apatite complex produced an estimated 15.5 million tons of concentrate (41 million tons of ore) in 1977 from three open pits and one underground mine and provided about

Digitized by Google

70% of all raw materials for the production of phosphate fertilizers. Of the underground and open pit mines, the most important is the Tsentral'nyy open pit, from which over 18 million tons of ore was mined in 1977. U.S. trucks, bulldozers, and other equipment are used. The concentration is carried out in two flotation plants, which in 1977 handled 41 million tons of ore to produce 15.5 million tons of concentrates. The No. 2 plant is larger than the No. 1, but the technology is identical—triple-stage crushing, single-stage grinding and classifying, basic controlling, and three washing-flotation operations (thickening, filtering, and drying).

A new apatite deposit at Mount Koashva was assigned to the Apatit Association in 1973. The Koashva open pit, with an annual capacity of 7 million tons of ore, was under development in 1977. The first stage of this pit, with capacity of 3.6 million tons of ore per year, was scheduled for completion in 1978 and it will be linked to Kirovsk by rail. Construction of the experimental mill at the Zabaykal'sk complex in Buryat A.S.S.R. continued in 1977. Between 1978 and 1980, this mill was to begin experimental production of an apatite concentrate from the Oshurkovo deposit, where reserves are large but have only a 4% P_2O_5 content. In the future, the Zabaykal'sk apatite complex, with an annual capacity of 1.0 to 1.5 million tons of concentrate, is to be built.

At the Kovdor iron ore complex of the Kola Peninsula, an apatite concentrate plant, with a first-stage capacity of 880,000 tons, was commissioned in 1975; the second stage, with the same capacity, was under construction in 1977 and scheduled for completion by 1978. The facility processes tailings from the iron ore concentration complex. The U.S.S.R. Ministry of Chemical Industry, which has already invested over 60 million rubles in the construction of the project, has asked the Gosplan, the central planning body of the Soviet Union, to reduce already reduced planned targets for production of apatite concentrate at Kovdor. Reason for the action is the inability of Soviet fertilizer plants to use apatite from the Kovdor complex owing to the material's excessively high magnesium oxide content.[79]

Apatite production at Kovdor is based on "tailings" from main iron ore beneficiation operations of the complex, and scientists there say that it is impossible to reduce magnesium oxide content to viable levels.[80] The Kovdor complex lost some 7 million rubles in 1976 and showed no sign of recovering the original investment, particularly since operations have sunk to almost experimental levels. However, the second stage of this complex was due to begin producing 880,000 tons per year of apatite concentrate in mid-1978.[81]

The apatite complex was to increase its concentrate output from 15.3 million tons in 1975 to 18.2 million tons in 1980, or by 22%. It was planned to invest 380 million rubles and to commission new facilities for the production of 4 million tons of apatite concentrate, 17 million tons of apatite nepheline ore, and 2 million tons of nepheline concentrate.

The 47 commercial deposits in the Karatau area of Kazakhstan contain 1,500 million tons of minable phosphorite. The five largest deposits, the Dzhantas, Aksau, Chulaktau, Koksu, and Kokdzhone, contain more than half of the total reserves. Seven open pits at the Aksay and Dzhantas deposits and the Molodezhnyy underground mine at the Chulaktau deposit produced an estimated total of over 10 million tons in 1977. Some 70% came from the Dzhantas deposit. The ore content ranges from 21% to 25% and was upgraded to 28.5% P_2O_5, but recovery was low. It was planned to produce about 20 million tons of phosphorite in the Karatau area in 1980. During 1978-80, the following mines were to be commissioned: Kok-Dzhon, annual capacity 4.75 million tons of ore; T'esay, capacity 2 million tons; and Kok-Su, Ur-Bas, Geres, Kis Tas, and other small mines with a total capacity of 20 million tons of ore and 13 million tons of marketable products.

During 1976-80, a mine with an annual capacity of 950,000 tons of phosphorite concentrate, containing 24% P_2O_5, was to be built on the basis of the Chilisay phosphorite deposit in Aktyubinsk Oblast', Kazakhstan. Its commissioning is planned in two stages in 1979 and 1980, each at 475,000 tons per year. A pilot concentrator, with an annual capacity of 10,000 tons of phosphate flour, has been put into operation at Chilisay.

During 1976-80, the Kingisepp phosphorite complex is to invest 270 million rubles to double its production. A double superphosphate plant with an annual capacity of 860,000 tons (18.7% P_2O_5) is to be built here, and its monoammonium phosphate facilities were to be increased from 680,000 to 960,000 tons per year. To meet phosphorite

Digitized by Google

flour production plans, the Podmoskovsk mining and chemical complex was to develop new open pits, with a total annual capacity of 3.1 million tons, in 1978-80. At the Lopatino and Yegor'evsk mines, new facilities for production of 200,000 tons per year of phosphorite flour, at a cost of 68.8 million rubles, are to be commissioned by 1980. A 200,000-ton-per-year increase in output of phosphorite flour is expected from the Verkhnekamsk complex in this 5-year plan period. Capacities for the production of 1.44 million tons per year of phosphorite ore, including 840,000 tons per year as a replacement for depleted capacity, are to be commissioned at this complex, at a cost of 27.3 million rubles. During 1976-80, the Bryansk phosphorite plant should commission facilities to produce 750,000 tons per year of phosphorite ore as replacement for depleted ores. Reportedly, the Soviet Union has agreed to buy at least 5 million tons of phosphorite ore from Morocco under a long-term contract.

Potassium.—The Soviet Union is the world's leading producer of potassium salts. Estimated output was 20.0 million tons (41.6% K_2O) or 8.3 million tons in nutrient content, 0.4% higher than in 1976. Output of potash increased from 9.9 million tons (41.6% K_2O) in 1970 to 19.1 million tons in 1975. Under the 1976-80 plan, output of potash was to increase from 19.1 million tons to 26 million tons (41.6% K_2O). Estimated levels of potash output for 1978 and 1980 were 22 million tons and 24 million tons, respectively. The total output of the potassium mines in the U.S.S.R. was about 65 million tons of ore in 1977 and was to be increased to 85 to 90 million tons by 1980. It was planned to construct Soligorsk No. 4, Berezniki No. 4, and Novo-Solikamsk, and to enlarge facilities at the Solikamsk No. 1, Berezniki No. 3, and Soligorsk No. 3 complexes, with a total annual capacity of 8.9 million tons (41.6% K_2O). Soviet exports of potash declined from about 6 million tons in 1975 (41.6% K_2O) to an estimated 5.6 million tons in 1977.

Gross potash reserves are reported at 22,900 million tons of 16% to 40% K_2O content (3,800 million tons of K_2O). About two-thirds of the reserves are located in the Upper Kama Basin in the north Urals. The four major producers are Solikamsk and Berezniki (49.6% of the total) on the western side of the Urals, Soligorsk in Belorussia (43.6%), Stebnikov (2.9%), and Kalush (2.7%) in the West Ukraine. Some 1.2% of the total was produced by enterprises of nonferrous industry. The following 10 complexes, with a total annual capacity of 21.38 million tons (41.6% K_2O), were in operation in 1977: Berezniki Nos. 1, 2, and 3; Solikamsk Nos. 1 and 2; Soligorsk Nos. 1, 2, and 3; and the first stages of the Novostebnikov and Kalush complexes. In the potash mines, the room-and-pillar method is used. In 1977, three complexes were under construction: The first stage of the Soligorsk No. 4 in Belorussia, Berezniki No. 4, and Novosolikamsk in the Urals.

Reportedly, the Soviet Union has signed a DM3 million contract with GHH Sterkrade of the Federal Republic of Germany for the supply of Fahrlanders and spare parts for use in potash mining. In 1975 several Fahrlanders, each with a bucket capacity of 5.6 cubic meters, were sold to the U.S.S.R.

Fluorspar.—Despite the Soviet Union's effort to achieve self-sufficiency, it remained a net importer of fluorspar. Imports of fluorspar, mainly from Mongolia, China, and Thailand, increased from 144,700 tons in 1970 to 493,900 tons in 1975 and to an estimated 500,000 tons in 1977. With an estimated production of 500,000 tons, 2% more than in 1976, Soviet consumption of fluorspar in 1977 was 1 million tons. The iron and steel industry consumed more than 85% of the total, and consumption is increasing by 8,000 to 10,000 tons each year. Estimated levels of fluorspar output for 1978 and 1980 are 510,000 tons and 540,000 tons, respectively.

Soviet consumption of fluorspar in steel production by process is as follows, in kilograms per ton:

Open hearth	0.03 to 1.5
Oxygen converter	2.1 to 5.2
Electric steel	2.5 to 10.2
Ferroalloys	1.07 to 1.42

The Maritime Territory (Yaroslavsk deposit), Transbaykal (Kalaguysk, Abagatuysk, Usuglinsk), Uzbekistan, and Kazakhstan were the main production areas in 1977. The mined ore contained 20% to 45% CaF_2. Hand picking, classification, beneficiation in heavy media, and flotation methods are used for concentration. The Central concentrator in Uzbekistan, which is treating ores containing 24.3% to 26.5% CaF_2, produced a 95% CaF_2 concentrate with recovery of about 85%. The mill in Maritime Territory is treating ores with an average CaF_2 content of 40.5% with about 75% recovery in a 92% CaF_2 concentrate. During 1976-80, it is planned to increase

Digitized by Google

recovery and quality of calcium fluoride at the Yaroslavsk, Kalunguysk, and Takobsk (Tadzhikistan) complexes and the Kyakhtinsk mine. Exploration of the Suppatash, Kengutan, and Shabres deposits continued in 1977.

Mica.—Output, estimated at 44,000 tons, 2.3% over that of 1976, was inadequate to meet demand, and strategic-grade mica continued to be imported from India for special industrial requirements. Imports of high-grade mica rose from 483 tons in 1970 to 498 tons in 1975 and to an estimated 550 tons in 1977. Estimated outputs for 1978 and 1980 are 45,000 tons and 47,000 tons, respectively.

Irkuts Oblast' continued to be the main supplier of muscovite mica; 75% of all muscovite deposits in the country are in Mamsko-Chuysk County of Irkutsk Oblast'. Over 1,500 veins have been discovered in this area, and 9 small underground mines were in operation in 1977. Mica is also mined in Murmansk Oblast' on the Kola Peninsula, Karelia, and Yakutia.

The Kovdorslyuda (Kovdor mica) complex in Murmansk Oblast' operates the Yena, Pikolatva, and Kovdor underground mines and vermiculite open pit. Mining of vermiculite began here in 1960, and the first Soviet vermiculite dressing mill was put into operation in 1976. The 38.2% vermiculite content in the ore (average) is upgraded to 88% with recovery of about 64%. The capacity of the Kovdor vermiculite concentrator is 56,000 tons per year of concentrate. The Karelslyuda (Karel mica) complex in Karelia operates the Plotina, Malinovaya Varakka, and Tedino underground mines. Two 400-meter-deep exploratory shafts were being sunk at the Malinovaya Varakka mine in 1977. The Irkuts and Petrozavodsk mica factories are the largest in the U.S.S.R. It is planned to develop the Slyudyanoy Bor deposit in Karelia in the future.

Salt.—The Soviet Union is one of the world's leading countries for salt reserves, production, and exports. Production of salt increased from 12.4 million tons in 1970 to 13.7 million tons in 1975. It was planned to increase production of salt to 20 million tons in 1980; however, the estimated production levels for 1977 and 1980 are 15.5 million tons and 18 million tons, respectively. Exports increased from 293,600 tons in 1970 to 429,767 tons in 1976 and to an estimated 430,000 tons in 1977. Salt development is concentrated in the Donets Basin, the Urals, East Siberia, Armenia, and West Ukraine.

The Donets Basin continued to account for over 40% of the total output in 1977. Development of a new mine, with an annual capacity of 2 million tons, at Artemovsk in this region, construction of the Verkhnekamsk salt complex in Perm Oblast', and renovation of the Iletsk mine in Orenburg Oblast' continued in 1977. The Nizhniy Baskunchak salt complex, with capacity of 700,000 to 900,000 tons per year, was also under construction. Construction of the Mozyr' salt complex in Belorussia, which began in 1974, based on rock salt deposits that lie at a depth of up to 700 meters, continued in 1977. The planned capacity of the complex is 360,000 tons per year. It is planned to develop new mines at rock salt deposits near Gusev in Kaliningrad Oblast', at Belbazh in Gor'kiy Oblast', and near the town of Novaya Zima in Irkutsk Oblast'. The U.S.S.R. has awarded a contract to Tecnimont for the engineering of the 270,000-ton-per-year Sterlitomak salt plant in Bashkiria. The plant, based on Montedison technology, was due to start up in 1977 but was rescheduled for 1978.

Sulfur.—Estimated domestic production of contained sulfur totaled 9.5 million tons, of which 3.3 million tons was recovered from pyrite, 2.1 million tons from native sulfur, and 3.3 million tons from other elemental sulfur. Estimated levels of total sulfur output for 1978 and 1980 were 11.2 million tons and 13 million tons, respectively. Sulfur exports, mainly to Comecon countries, decreased from 463,800 tons in 1970 to an estimated 430,000 tons in 1977. Imports of sulfur increased from 216,700 tons in 1970 to an estimated 650,000 tons in 1977. The principal producers of native sulfur continue to be Rozdol (West Ukraine), Gaurdak in Turkmen S.S.R., Yavorov in West Ukraine, and the Volga group of the Kuybushev sulfur complex, which together produced the bulk of the country's requirements.

The dressing mills of all four complexes are treating ore with a sulfur content from 8% to 40%. Sulfur production by the Frasch process at the Gaurdak complex has increased rapidly since the second installation (100,000 tons per year) went into service in 1975. The No. 3 100,000-ton-per-year installation, using Frasch process at this complex, was nearing completion in 1977. During the 1976-80 period, production of sulfur at Gaurdak is to increase 50% through the commissioning of a new open pit and expansion of production by the Frasch process.

Digitized by Google

The Alekseyev and Vodnin mines are in operation at the Kuybyshev sulfur complex. It was planned to recover 895,000 tons of sulfur from the Orenburg sour gas in 1977. During 1976-80, the production of sulfur from gas was to increase by a factor of three.

A sulfur deposit has been discovered in the valley of the River Prut in the vicinity of Ivano-Frankovo. Thirty-three wells have already been drilled to a depth of 250 to 300 meters. Reportedly, the reserves of this deposit are equal to the reserves at the Rozdol deposit in the vincity of L'vov.

Production of sulfuric acid increased from 20 million tons in 1976 to an estimated 22.4 million tons in 1977. Sulfuric acid production began at the Krasnodar chemical complex in North Caucasus, and the third section for production of sulfuric acid at the Dzhezkazgan copper complex in Kazakhstan was completed. In 1977, the nonferrous industry produced 30% of the total country's sulfuric acid output. Poland continues to supply the U.S.S.R. with sulfuric acid plants.

MINERAL FUELS

Estimated production of primary energy derived from fossil fuels, fuelwood, and hydroelectric and nuclear generation increased from 1,696 million tons (standard coal equivalent) in 1976 to 1,779 million tons in 1977. The output of primary energy from all sources in 1980 was to rise to over 2,000 million tons.

Compared with 1975 output, the 1980 production of oil was to rise 30%, natural gas 55%, coal 15%, hydroelectric power 47.9%, and nuclear power 333%. The share of petroleum and natural gas in the total Soviet primary energy production increased from 66.5% in 1976 to 67.3% in 1977, while that of coal (anthracite, bituminous, and lignite) declined from 29.4% in 1976 to 28.5% in 1977. In 1980, the share of petroleum and natural gas in the total energy production is to be 69%, coal will supply about 27%, and 4% will be provided by other sources.

Total estimated consumption of all types of primary energy in the Soviet Union increased from 1,456 million tons in 1976 to 1,529 million tons in 1977. The share of petroleum and natural gas in the total Soviet primary energy consumption increased from 62.5% in 1976 to 63.4% in 1977, while that of coal declined from 32.8% to 31.9%, respectively. Total consumption of all types of primary energy in the U.S.S.R. is expected to be equivalent to about 1,785 million tons of standard coal in 1980. Clearly, there will be a trend towards greater use of oil in the future. However, it is expected that the U.S.S.R. will make great efforts to substitute coal and natural gas for petroleum in order to make the latter available for export.

According to published long-term agreements between the Soviet Union and other nations and the trade objectives announced in the various Comecon countries' 5-year plans (1976-80), it has been estimated that fuel exports from the U.S.S.R. to the market-economy countries would be increased from 94 million tons of standard coal equivalent in 1975 to 145 million tons in 1980. Some 75 million tons of crude oil and petroleum products, 12 million tons of coal and coke, and about 22 billion cubic meters of natural gas is to be exported to market-economy countries in 1980.

Shipments of crude oil and petroleum products to nonmarket-economy countries in 1985 have been estimated at 130 million tons, an increase of 30 million tons over the estimated 1980 level. The amount of crude oil and petroleum products available for export to the West in 1985 will be about 75 to 80 million tons.

In 1977, the U.S.S.R. produced 546 million tons of crude oil and gas condensate, 722 million tons of run-of-mine coal and lignite, and 346 billion cubic meters of natural gas. Soviet long-range forecasting places the demand for raw coal and lignite at over 800 million tons in 1980 and at 1,000 million tons by 2000.

Estimated total primary energy balance of the U.S.S.R. for 1977 and 1980 is shown in table 4.

Digitized by Google

Table 4.—U.S.S.R.: Estimated total primary energy balance

(Million tons of standard coal equivalent)

	Production		Imports		Exports		Apparent consumption	
	1977	1980	1977	1980	1977	1980	1977	1980
Total primary energy	1,778.9	2,086.5	38.5	46.7	288.5	347.8	1,528.9	1,785.4

Fuelwood	26.0	25.0	--	--	--	--	26.0	25.0

Coal.—In 1977, the Soviet Union produced an estimated 722 million tons of run-of-mine coal—bituminous coal (478 million tons), anthracite (78 million tons), and lignite (165 million tons), or an estimated (according to Western practice) 415 million tons of "clean" coal, placing it second among the world's coal producers. This was 10 million tons of raw coal more than was produced in 1976. Coal production failed to reach its 733-million-ton target by 11 million tons. The 1.5% increase from the 1976 level was achieved mainly in coking coal, 186 million tons of which was produced.

The Soviet coal industry employed 2.2 million men and women, including about 1.2 million "production" workers, some 0.6 million "nonproduction" workers, 213,000 graduate engineers and technicians, and 28,000 managers and general managers. The coal industry employed 770,000 women, including 109,000 at the underground mines. There were 638,000 workers in the Donets coal basin alone in 1975. On the average, there were 60 specialists (mainly mining engineers and geologists) with a university degree and over 150 graduate technicians for each mine. In the U.S.S.R., coal output and productivity are recorded on a ton-for-ton basis of unbeneficiated coal.

New facilities, with an annual capacity of 17.4 million tons of run-of-mine coal and lignite, were commissioned during the year, of which 5 million tons was in the Ekibastuz basin. Construction of new projects continued to be slow, expensive, and frequently below established Western professional standards. At many mines, construction schedules were twice as long as plan specifications. Many new coal mines did not reach their planned capacity in 1977. Some of them have been lagging behind their annual targets for many years. Of 50 new and renovated mines in the Donets coal basin in the past 10 years, 38 had not attained their capacities according to industry reports.

There were about 800 underground mines with an average annual capacity of some 600,000 tons and 70 open pits with an average annual output of 3.4 million tons of run-of-mine coal and lignite. Raw coal production by principal basin in 1977 follows, in million metric tons:

Basin	Total output	Coking coal
Donets	222.0	86.9
Kuznetsk	141.9	60.0
Karaganda	48.2	19.1
Moscow	29.5	--
Pechora	26.7	16.7
Others	253.7	3.7
Total	722.0	186.4

The Donets, Kuznetsk, Karaganda, and Pechora coal basins together produced 80% of the total coal output in terms of calorific value and about 97% of the coking coal in the Soviet Union. The Asian part of the U.S.S.R. (east of the Urals) contributed about 60% of the total production in 1977, compared with 56% in 1975 and 49.5% in 1965.

The average working thickness of the coal seams, according to 1977 data, was 1.32 meters. The maximum depth of underground coal production reached 1,150 meters in 1977, while the average depth was about 400 meters, compared with 380 meters in 1975 and 320 meters in 1965.

The relative share of coal production coming from gently dipping seams was about 70%, that from inclined seams was 14%, and that from steep seams was 16%. The hand-loading of coal at gently inclined seams was about 20% in 1977.

Distribution of coal production by mining methods, in percent, follows:

Digitized by Google

Longwall	85
Slicing	8
Shield	3.2
Room-and-pillar	1.7
Others	2.1

In 1977, the average longwall length was 137 meters and the average rate of advance was 40.1 meters per month. The average capacity of each underground mining section (longwall) was 461 tons of raw coal per day (four 6-hour shifts) in 1977.

Coal preparation plants of the Ministry of Coal Industry processed 287.2 million tons of coal in 1977, including 121.9 million tons for coking. They produced 165 million tons of clean coal (recovery 57%), including 84.3 million tons for coking. About 60 million tons of raw coking coal was processed by coal preparation plants of the Ministry of Ferrous Metallurgy. The processing volume increased by 0.9% over that of 1976 and the output of clean coal by 1.5%. The official average ash content of coal shipped to consumers in 1977 was 20.2%. The official records of the Ukrainian Ministry of Coal Industry for 1976 showed that average ash content of coal shipped by the mines was 24%, but actual ash content of shipped coal was 32%, or 8% higher, according to transportation documents.[82]

The biggest consumers of coal are the coal-fired power stations, ferrous metallurgy, industrial and district boiler installations, and the municipal service sector. They account for 74% of the total quantity of coal produced (table 5).

Table 5.—U.S.S.R.: Consumption of coal by sector

(Percent)

Sectors	1965	1970	1975	1977	1980
Coal-fired power stations	35.3	38.1	37.1	38.0	39.7
Industrial and district boiler installations	7.7	7.1	7.2	7.0	6.6
Iron and steel industries	15.4	16.9	13.2	13.0	13.0
Municipal service sector	14.3	17.2	15.9	16.0	14.4
Others	27.3	20.7	26.6	26.0	26.3
Total	100.0	100.0	100.0	100.0	100.0

Table 6 shows the growth of raw hard coal and lignite production in the U.S.S.R.

Table 6.—U.S.S.R.: Growth of raw hard coal and lignite production

(Million tons)

Year	Total coal output	Hard coal (including anthracite)	Anthracite	Brown coal	Use of coal	
					Coking	Others
1965	577.7	427.9	76.5	149.8	138.0	439.7
1970	624.1	476.4	75.8	147.7	164.8	459.3
1975	701.3	537.7	77.0	163.6	181.0	520.3
1976	711.5	548.0	77.7	163.5	186.2	525.3
1977	722.0	556.0	78.0	166.0	186.0	530.0

Although the U.S.S.R. does not publish statistical data on injuries in the coal industry, available Soviet information discloses that "The number of accidents in the coal industry remains high...because untrained people are being sent to the longwalls."[83]

Karagandaugol's coal mining operations, under the town of Karaganda in Kazakhstan, are causing the collapse of houses and other buildings. In addition, over 130 kilometers of the water-supply network have been ruined over the past 5 years, leaving whole areas of the town without water. Karagandaugol' administration is making little or no attempt to prevent the subsidence or restore what it has destroyed.[84]

Total Soviet economically minable coal and lignite reserves in place in categories $A+B+C_1$ (measured+indicated+inferred) in January 1975 were 420 billion tons, including 87 billion tons of coking coal. Over 70% of the total coal and lignite reserves are located in the eastern (Asian) part of the U.S.S.R. Principal coalfields in the European part of the U.S.S.R. are the Donets, the Pechora, and the Moscow basins; the principal fields in the eastern regions are the Kuznetsk and the Karaganda basins.

The Plan for 1980.—The production of raw coal and lignite is planned to rise to 746 million tons in 1978 and to 800 million tons in 1980, but actual output will be below the planned targets. In 1976-80, the annual capacity of coal and lignite mines is to be increased by 123.5 million tons (raw coal and lignite), and 17 coal beneficiation plants, with total annual capacity of 57 million tons of raw coal, are to be constructed or renovated. During the 1976-80

Digitized by Google

plan, development of the Ekibastuz, Kansk-Achinsk, and the Southern Yakutsk coal basins will be accelerated. It is planned to increase production of coal and lignite in this period by 28.2 million tons at the Ekibastuz basin, by 24.8 million tons at Kuznetsk, by 14.4 million tons at Kansk-Achinsk, by 11.8 million tons at Donetsk, and by 7.5 million tons at Pechora. The share of surface coal mining is to be about 35% by 1980.

Soviet coal and coke statistics are presented in table 7.

Table 7.—U.S.S.R.: Coal and coke statistics

(Million metric tons)

	Actual					Planned
	1960	1965	1970	1975	1977	1980

e Estimate.
[1]Run-of-mine coal as reported in Soviet sources.
[2]Clean coal, estimated in accordance with Western practice and experience.
[3]None from market economy countries.

Source: Production data taken from the National Economy of the U.S.S.R., Moscow, 1960, 1965, 1970, and 1975, and Ugol' (Coal), Moscow, No. 4, 1977, p. 67; trade data from Foreign Trade of the U.S.S.R., Moscow, 1960, 1965, 1970, 1975, and 1977.

Natural Gas.—In 1977, the Soviet Union produced 346 billion cubic meters of usable gas, 7.5% more than in 1976 and above the 1977 planned target of 342 billion cubic meters. Of this quantity, over 99% consisted of natural gas and oil associated gases; less than 1% was gas from gasification of coal and oil shale. In 1977, gas accounted for 23.1% of the U.S.S.R. primary energy production and 25.7% of primary energy consumption. Of 5,000 wells operating in more than 650 gas, gas condensate, and gas-oil fields in 1977, 15% to 20% were idle. For the second time since 1956, the gas industry was able to meet its original annual production goal.

The recovery of associated gases rose from 22.9 billion cubic meters in 1970 to 28.6 billion in 1975. Significant losses of associated gases were encountered in many oil producing regions. It was planned to carry out a number of important measures for increasing the effectiveness of utilization of associated gas from 61.6% in 1970 to 85% in 1975. The extraction target for 1975 had been set at 41.5 billion cubic meters in 1970. The actual production of associated gas, however, had reached only 28.6 billion cubic meters in 1975. In 1977, the utilization of associated gas was about 65%. It is planned to extract 43.5 billion cubic meters of associated gas in 1980.

The Ministry of Construction of the Enterprises of the Oil and Gas Industry did not fulfill plans for the development of oil and gas fields and construction of gas pipelines, compressor stations, and underground gas storages according to official reports.

Gasfields.—More than 300 gas and gas-condensate fields were in exploitation in 1977. According to Soviet data, gas reserves in place in the A, B, and C_1 categories as of

Digitized by Google

January 1976 were 25,800 billion cubic meters, of which 4,200 billion cubic meters were in the European part of the U.S.S.R., 18,200 billion cubic meters were located in Siberia and the Far East, and 3,400 billion cubic meters were in Central Asia and Kazakhstan.

The Bukharo-Khivinskiy region (eastern Turkmenistan and western Uzbekistan) continued to occupy first place in the production of gas in the U.S.S.R. Production of gas in this region reached an estimated 85 billion cubic meters in 1977, an increase of over 75% compared with the 1971 output. The gross gas reserves as of January 1, 1975, were estimated at 2,761 billion cubic meters (including 1,856 billion cubic meters in eastern Turkmenistan). At the beginning of 1977, 21 gasfields were in operation (including 6 in eastern Turkmenistan) and 15 gasfields were under development (including 4 in eastern Turkmenistan).

Development of the North Achak, Naip, East Shaltyk, and West Shaltyk gasfields in eastern Turkmenistan resulted in the production of about 50 billion cubic meters of natural gas in Turkmen S.S.R. in 1977, four times the amount produced in 1970. The Shaltyk gasfield was supplying 48 to 50 million cubic meters of gas per day in 1977, compared with 40 to 42 million cubic meters per day in 1974. The Uzbek S.S.R. produced an estimated 36 billion cubic meters of gas in 1977. The gasfield at Gazli, the largest in this Republic, produced from more than 200 developmental wells, over three-quarters of the Uzbekistan total.

West Siberian gas production increased from 9 billion cubic meters in 1970 to an estimated 38 billion cubic meters in 1975, 47.8 billion in 1976, and 71 billion in 1977. The region is slated to produce 115 to 145 billion cubic meters in 1980, or 29% to 33% of the Soviet total. Almost two-thirds of total Soviet gross natural gas reserves are located in Tyumen' Oblast'. Four fields were in operation in this region: Punga, Igrim, Pakhomovsk, and Medvezhye. The latter is the largest of the four. The Medvezhye field, development of which began in 1972, produced about 1.5 billion cubic meters in 1972, over 8 billion in 1973, and some 60 billion in 1977, or about 85% of all West Siberian production. This field is expected to produce almost 65 billion cubic meters in 1980.

Drilling of the first developmental well at the Urengoy gasfield in Tyumen' Oblast', the Soviet's biggest gasfield, was completed in June 1975. It is expected that gas production at the Urengoy field will begin in 1978. The Urengoy field is regarded as the world's largest gasfield, with estimated gross reserves of 5,000 billion cubic meters. Output was expected to reach 15 billion cubic meters in 1978, 26.5 billion in 1979, and 58 billion in 1980.

As most of the older producing regions are past their peak, attention is shifting to gasfields in Western Siberia. About 85% of the planned increase in production during 1976-80 was expected to come from this region.

The Ukraine occupied third place in the production of gas in the U.S.S.R. Thirty-four gasfields were in operation, including Shebelinka and Efremovka.

The Orenburg gas condensate field was one of the largest projects of the ninth (1971-75) 5-year plan. Two stages of the Orenburg complex, which is to have a total annual capacity of 30 billion cubic meters of gas, 800,000 tons of sulfur, and 2.4 million tons of condensate, were put into operation in 1974 and 1975. The third (last) stage, with the same capacity of 15 billion cubic meters of gas, was scheduled for completion in 1978. The third stage will consist of 100 operational wells and processing plants. Under a contract signed in September 1975, the French firm Creusot-Loire was to supply the Soviet Union with equipment for the extraction and field processing of 15 billion cubic meters of gas per year of the third stage. Reportedly, the French firm, Technip, and the Soviet Tekhmashimport have signed a F1 billion contract for a natural gas desulfurizing plant, which will be part of the third stage of the Orenburg gas complex. The plant is to have a processing capacity of 17 billion cubic meters of gas per year, the same as that of the first two, which were also constructed by Technip.

Production of gas at the Vuktyl condensate gasfield in Komi A.S.S.R. increased from 18.5 billion cubic meters in 1975 to about 20 billion cubic meters in 1977.

Transportation.—The great distance of the principal consuming centers from the gasfields requires large pipelines for the bulk of natural gas. About 95% of 1977 natural gas production was carried by trunk pipeline, and only 5% was consumed at or near the place of production. The total length of trunk gas pipelines increased from 103,500 kilometers in 1976 to an estimated 110,000 kilometers in 1977. Capital investments in gas transport account for more than 60% of the total investments in the

Digitized by Google

gas industry.

Completion of 6,500 kilometers of gas trunk pipelines and 42 compressor stations was planned for 1977. Completed were the 1,300-kilometer Nizhnevartovsk-Tomsk-Kuzbass line, the No. 3 (1,300 kilometers) Ukhta-Torzhok line, and a number of new sectors of the Central Asia-Center and other gaslines. Construction began on the 1,420-millimeter-diameter Komsomol'sk-Surgut-Chelyabinsk gasline.

Consumption.—A preliminary report of Soviet consumption of natural gas in 1977 is presented in the following tabulation:

Consumer	Percent of total
Communal everyday needs	12.8
Generation of electric power	26.2
Industry:	
Chemical	6.5
Metallurgy	15.4
Machine building and metal working	9.9
Construction materials	9.4
Oil and gas	9.2
Light	1.3
Food	3.3
Woodworking	.7
Other	1.4
Total industry	57.2
Transport	.3
Agriculture	.4
Construction	.7
Other consumers and losses	2.4
Total gas consumption	100.0

In the last decade, the structure of natural and associated gas consumption in the Soviet economy has remained comparatively stable. About 12% to 13% of the total amount of gas distributed is used in the public service sector and by households, 55% to 57% is used in various branches of industry, and 24% to 26% is used in thermal powerplants.

In 1977, gas consumption in the chemical industry expanded. Natural gas is used as a feedstock for the production of ammonia and rectified methanol, in the production of phosphate and potash fertilizers, and in other production processes.

In 1977, natural gas was used in the production of 43% of total rolled ferrous metal output, 25% of nonferrous metals, 87% of the steel, 86% of the pig iron, and 61% of the cement.

It was planned to increase consumption of natural gas, in billion cubic meters, as follows:

	1970	1980
Ferrous metallurgy	28.2	48.9
Nonferrous metallurgy	2.6	7.4
Powerplants	51.1	81.3
Agriculture	.7	3.5
Chemical industry	12.9	41.8
Machine building and metal working	18.8	28.8
Construction materials industry	18.3	26.9
Communal everyday needs	25.1	46.4

The Plan for 1978 and 1980.—It was planned to extract 370 billion cubic meters of natural gas in 1978, an increase of 24 billion cubic meters over that of 1977. Most of the increase was expected to come from fields in Western Siberia, Orenburg Oblast', and Central Asia. The extraction of natural gas in 1980 was planned at 435 billion cubic meters—about 146 billion cubic meters over that of 1975. Most of the increase was to come from the following gasfields: Urengoy, Medvezh'ye, Vyngapurovsk, Komsomol'sk (Western Siberia), and Orenburg. In 1976-80, 35,000 kilometers of underground gaslines were to be built. Almost 30% of these consist of 1,420-millimeter-diameter pipe. Compressor stations were to be outfitted with gas-pumping aggregates with a capacity of up to 25,000 kilowatts. The total length of trunk gas pipelines in January 1981 is to be about 134,000 kilometers.

Exports.—Exports of natural gas totaled 1.02 billion rubles, up from 750.6 million in 1976. Value of Soviet gas exports represented 3.1% of total U.S.S.R. official exports, an increase from 2.7% in 1976.

On the basis of value, 55% of Soviets' 1977 gas exports went to East European nonmarketr-conomy countries and 45% to the West European nations of the Federal Republic of Germany, Austria, Italy, France, and Finland.

Combined value of Soviet oil and gas exports represented 31.4% of total U.S.S.R. official exports, an increase from 30.1% in 1976.

Soviet exports of natural gas in 1973-77 are presented in the following tabulation:

Country	Billion cubic meters				Value (thousand rubles)	
	1973	1974	1975	1976	1976	1977

Austria was the first West European country to import Soviet natural gas under a 23-year agreement signed in 1968 and a later agreement signed in 1974. The Soviet Union has three agreements (1970, 1972, and 1974) with the Federal Republic of Germany's Rhurgas for delivery of gas over 20 years in exchange for large-diameter steel pipe and pipeline construction equipment. the Federal Republic of Germany began to receive Soviet gas in 1973.

In 1974, Italy joined the group of West European importers of Soviet natural gas. From 1977, 6 billion cubic meters of Soviet gas will be sent annually to Italy under a 20-year agreement. Deliveries of Soviet gas to Finland under the 20-year agreement started in 1974 and will be raised to 1.4 billion cubic meters per year. France bought Soviet pipeline natural gas for the first time in 1976. Beginning in 1977, 2.5 billion cubic meters of soviet gas was to be sent annually to France under a 20-year agreement.

The Soviet Union intends to increase further deliveries of natural gas to West European countries via a second international piepline of 28-billion-cubic-meter annual capacity to be constructed by 1978. This will also increase deliveries of gas to Czechoslovakia and begin to supply gas to Yugoslavia.

The total length of both stages of the international gasline, including branches, is to be 10,000 kilometers. The main distribution center is Czechoslovakia, whence gas flows through several branch lines to German Democratic Republic, the Federal Republic of Germany, Austria, and Italy. An additional branch line to France is also planned. It is expected that Soviet annual exports of natural gas to Italy, in exchange for additional equipment and plants, will rise from the anticipated 7 billion cubic meters to 10 billion cubic meters per year.

The North Star Siberian gas project for the extraction, liquefaction, and export of natural gas to the United States, Japan, and Western Europe from the Urengoy gasfield was under consideration in 1977. This project was abandoned in 1974 following an unfavorable reception by the U.S. Congress.

Under a new proposal, British, French, and West German banks and financial institutions are to make the loans to the Soviet Union to buy a French liquefied natural gas plant, German pipe, and British auxiliary equipment for the project. The Soviet Union was studying this proposal in 1977. Reportedly, the Soviet Union is investigating the possibility of developing the North Star gas project with financing by the United States, Japan, and West European countries.

Sweden has begun discussions with the Soviet Union on the purchase of Soviet natural gas.

Reportedly, exploratory surveys conducted by U.S. and Japanese firms in Yakutia have confirmed reserves of 700 billion cubic meters. Prospecting for an additional 300 billion cubic meters continued in 1977. Under the present plan, after confirmation of 1,000 billion cubic meters, the Soviet Union would supply gas from the Yakutia fields (after construction of a 4,350-kilometer pipeline) to Japan and the United States at an annual rate of 10 billion cubic meters each for a period of 25 years starting in 1983.

Soviet pipe imports, mostly large-diameter types used for gas and oil lines, were valued at 807.6 million rubles compared with 1,120 million in 1976. The biggest suppliers of pipe were the Federal Republic of Germany, Italy, Japan, Romania, and France.

A group from Mannesmann-Handel AG and Thyssen-Stahlunion AG was granted a contract to supply 380,000 tons of pipes to

Digitized by Google

the Soviet Union. The pipes, which were intended for the construction of gas pipelines, were to be suitable for use at low temperatures and were to be manufactured in the first three quarters of 1978. The project was financed on the basis of a credit agreement between a West German banking consortium led by the Deutsche Bank and the Soviet Foreign Trade Bank.

Reportedly, Canada's Export Development Corp. (EDC) will join an international syndicate of lending institutions and finance up to $20.5 million to support the sale, by Cooper-Bessemer of Canada Ltd., of natural gas pumping equipment to the Soviet Union. The sale involves 21 turbine compressers and related components.

The Canadian order is part of a $172 million contract awarded to a consortium of Canadian, British, and Dutch companies for a gas pipeline project in Western Siberia.

Soviet deliveries to Comecon countries in 1977 increased by 40% over those of 1975 and were to be doubled by 1980. The U.S.S.R. planned to substitute natural gas for oil wherever possible in exports to Eastern Europe. Czechoslovakia remained the biggest buyer of Soviet gas in 1977, followed by German Democratic Republic, Bulgaria, Poland, and Hungary.

Under the Soviet-Hungarian agreement of 1971, delivery of natural gas through the first stage of the Soviet-Hungarian Brotherhood Gas Pipeline began on May 1, 1975, and through the second stage in February 1976. Hungary received 0.6 billion cubic meters of Soviet gas in 1975 and 1 billion cubic meters in 1976, and deliveries were to be increased substantially by 1980 to provide gas for both Hungary and Yugoslavia. The annual capacity of the pipeline was 2 billion cubic meters in 1976 and was to be 2.6 billion cubic meters in 1979.

Deliveries of Soviet natural gas through the joint Comecon pipeline from the Orenburg field have been planned for the early 1980's at 15.5 billion cubic meters annually, including 2.8 billion each to Czechoslovakia, Poland, German Democratic Republic, Hungary, and Bulgaria and 1.5 billion to Romania. The 1,420-millimeter-diameter pipeline was to be 2,677 kilometers long and have a capacity of 28 billion cubic meters per year. Over 13,000 East European workers were working in the U.S.S.R. in 1977 on the construction of this line, which was to be completed in the spring of 1979.

According to a Soviet-Bulgarian agreement, the U.S.S.R. was to supply Bulgaria with 3 billion cubic meters of natural gas annually by 1980. Bulgaria was also to receive 2.8 billion cubic meters of gas per year from the Orenburg pipeline. A contract for the supply of 4.5 billion cubic meters of natural gas from the Soviet Union to Czechoslovakia in 1977 was signed in Prague on December 9, 1976.

Soviet gas reserves are on the order of 25 trillion cubic meters, but the development of all these reserves would be extremely difficult and costly. One problem in development at the Tyumen' gasfields is that it takes about 1.5 years to get a piece of heavy equipment in place. Despite the enormous gas reserves, the Soviet Union is not likely to become a major world gas exporter. Siberian gas will, however, become a major factor in domestic energy balance.

Soviet exports will be offset to some extent by imports of gas from Iran and Afghanistan, which decreased from 12.5 billion cubic meters in 1975 to 11.8 billion cubic meters in 1976.

The route of the pipeline from the Soviet-Iranian frontier, which will pump Iranian gas to the Federal Republic of Germany through the U.S.S.R.'s gas transport system, was designed in 1976. The transcontinental pipeline, some 4,000 kilometers long, will carry over 12 billion cubic meters per year. On the basis of long-term loans, West German firms supply the U.S.S.R. with pipe and equipment to speed up development of gasfields. Repayment is made in future deliveries of gas to the Federal Republic of Germany.

Soviet natural gas statistics, in billion cubic meters, are presented in table 8.

Sources: National Economy of the U.S.S.R., Moscow, 1970-75; Pravda (Moscow), Jan. 23, 1976; Foreign Trade of the U.S.S.R., Moscow, 1970-76.

Petroleum.—Crude oil and gas condensate output in 1977 increased by 26 million tons (5%) to 546 million tons. The production of crude oil and gas condensate in 1980 is placed at 625 million tons. In 1977, about 500 oil and gas condensate fields (including 36 large fields) were in operation with a total of over 70,000 wells. As of January 1978, the gross reserves of crude oil in place in the U.S.S.R. may total 24 billion tons, including 2 billion tons measured (Soviet category A), 3 billion tons indicated (category B), 5 billion tons inferred (category C_1), and 13 billion tons potential (category C_2). The ratio of measured plus indicated reserves in place to production was 10:1 in 1977. A 30% to 40% recovery of crude oil in place was claimed in 1977. The current reserve-to-production ratio for the country as a whole declined by 45% as compared with that of 1955, and by 20% as compared with that of 1970.

The Soviet Union is rich in oil. However, despite the new discoveries, the rate of incremental growth in oil reserves is lagging behind the rate of growth in crude oil extraction. For the fourth year, the U.S.S.R. remained the world's largest oil producer. The country continued to expand its exports of crude oil and petroleum products even though the quantities available for internal consumption have been inadequate. The Soviet Union became a net exporter of crude oil in 1951 and petroleum products in 1954 and has gradually strengthened its position since that time. Crude exports increased from 0.9 million tons in 1951 to 110.8 million tons in 1976, while exports of products rose from 4.4 million tons in 1954 to 37.7 million tons in 1976. In 1976, exports of crude oil and petroleum products totaled 148.5 million tons, or 14.3% over that of 1975. Of the 1976 total, 64.5 million tons of crude oil and products were shipped to market-economy countries and the rest went to centrally-planned-economy countries, including 77.6 million tons to Comecon nations. The U.S.S.R. exported about 29% of its production in 1976.

Foreign trade of crude oil and products in 1977 accounted for about 9.4 billion rubles, compared with about 7.7 billion in 1976. About 4.2 billion worth of crude and products was delivered to a few non-market-economy countries, mainly Poland, Czechoslovakia, German Democratic Republic, Bulgaria, Hungary, and Cuba. Principal market-economy buyers were Italy, Finland, the Federal Republic of Germany, France, and the United Kingdom.

Reportedly, the U.S.S.R. was selling oil to the member countries of the Comecon at 49.2 rubles per ton. This confirms unofficial information that the price of Soviet oil has been increased by about 23% compared with that of 1976. The Soviet experts justi-

Digitized by Google

fied the increase by referring to the constant rise in the world price of oil and to the continual increase in the cost of exploitation and transport from distant areas of Siberia. The mobility of the price scale now used by the Comecon countries will enable the price of Soviet oil gradually to approach the price of oil on the world market, but it is not suggested that this could happen by 1980, as is expected in some Western countries.

Most of the U.S.S.R.'s increased production was derived from the Tyumen' fields, where 206 million tons (24 million tons over that of 1976) were produced in 1977. There were over 140 oilfields in Western Siberia in January 1978. The Samatlor oilfield in Tyumen' Oblast', the largest oilfield in the U.S.S.R., accounted for the major increments in West Siberia. Over 2,000 developmental wells were in operation at this field in 1977. The Fedorov field was the second largest in West Siberia in 1977.

Crude oil extraction (including condensate) is planned to be increased to 575 million tons in 1978, 29 million tons over that of 1977. The 1976-80 plan envisages production of crude oil and gas condensate of 620 to 640 million tons in 1980. The plan calls for the development of about 500 million tons of new capacity during the 1976-80 period; over two-thirds of this is to cover the decline in production of crude at the old fields, and about one-third (151 million tons) is to be available for a net growth in production. The average annual growth in crude oil extraction is to be increased to 30 million tons during the 1976-80. The basic increment in crude oil output is to be secured from the fields in West Siberia. Production of petroleum in this region is planned to increase from 148 million tons in 1975 to 300 to 310 million tons in 1980. In 1976-80, about 30 new oilfields are to be put into operation. The 1980 crude oil and gas condensate output of the U.S.S.R. has been estimated at 625 million tons, on the basis of projections from earlier years.

Based on signed trade agreements and the latest Soviet forecasts, oil exports (crude oil and products) from the U.S.S.R. are expected to increase from 130.4 million tons in 1975, 148.5 million in 1976, and an estimated 155 million in 1977 to 175 million tons in 1980, or 28% of its production that year. Soviet petroleum exports to market-economy countries probably will grow from 52.6 million tons in 1975, 64.5 million in 1976, and an estimated 65 million in 1977, to over 70 million tons in 1980. Crude oil and petroleum product exports from the U.S.S.R. to other centrally-planned economy countries will continue to grow, perhaps attaining 100 million tons per year by 1980.

The 1985 crude oil output of the Soviet Union has been estimated at 750 million tons on the basis of projections from earlier years as modified by information in the long-range plan. Some experts will quarrel with this estimate, but there is ample evidence from an analysis of the producing fields to substantiate these figures. Volga-Urals will continue to decline in relative importance, whereas Tyumen' Oblast' in West Siberia and Kazakhstan will make the most notable gains.

The average rate of growth of crude extraction in the first 7 years of West Siberian oilfield operation was 23 million tons per year. The average growth rate has been 33 million tons per year since then. The Samotlor field accounted for 70% of the total annual production, the Fedorovsk field accounted for 26%, and other fields accounted for the remaining 4%. Every year more than 1,000 wells, with an average depth of 2,000 to 2,500 meters, are drilled in Western Siberia. By 1980, there will be about 40 developed oilfields in operation. In 1977, Tyumen' region produced 206 million tons. By 1980, West Siberia will produce not less than 300 million tons of petroleum.

The anticipated date of peaking of the Samotlor field, the largest in the U.S.S.R., is 1979-86 and that of the Fedorovsk field is 1983-90. There is no reason, therefore, why growth of petroleum production will not continue into the 1980's, and there is no particular problem about meeting the planned targets for petroleum production to 1980 and beyond.

The U.S.S.R. will continue importing a high level of petroleum equipment and technology. With current Soviet technology and partially with equipment from the West, oil output in the U.S.S.R. could peak between 1986 and 1989.

Oil has long been a major export earner for the U.S.S.R., and it is intended to become more important. In recent years, there has been a growing emphasis on Soviet coal and natural gas production, making more petroleum available for export. In terms of value, the exports of petroleum were 24.6% of total Soviet official exports in 1975, 27.4% in 1976, and 28.3% in 1977.

Despite rising Soviet domestic consumption of oil, deliveries to centrally-planned

Digitized by Google

economy countries will increase according to obligations entered into, and deliveries to the West will stay at the same level or increase only slightly. The Soviet preference is to sell to the West more refined products, as compared to crude.

Shipments of crude oil to non-market-economy countries in 1985 have been estimated at 110 million tons, an increase of 35 million tons over 1976 shipments and 20 million tons over the estimated 1980 level. About 40 million tons of crude will be available for market-economy countries in 1985.

The amount of petroleum products available for export in 1985 have been estimated at 50 million tons, an increase of 12 million over 1976 exports and 5 million tons over the estimated 1980 level. Soviet exports of products to non-market-economy countries in 1985 have been estimated at 11 million tons. Thus, the amount available for export to the West will be about 39 million tons.

Soviet imports of crude oil and high-quality petroleum products in 1985 will be about 11 million tons. Thus, the net amount of crude oil and petroleum products available for export in 1985 will be about 190 million tons, of which more than 40% will go to the West.

Predictions that the U.S.S.R. will become a net oil importer in the early 1980's appear as unrealistic today as in the late 1960's.

Sources: Production data for 1960, 1965, 1970, and 1975 taken from the National Economy of the U.S.S.R., Moscow 1960, 1965, and 1970; data for 1977 are from Pravda, Moscow, Jan. 28, 1978, p. 1. Trade data from Foreign Trade of the U.S.S.R., Moscow, 1960, 1965, 1970, 1975, and 1977.

Other Fuels and Energy.—Among the Soviet resources of other fuels and energy of lesser significance in the energy economy in 1977 are hydroelectric power, nuclear energy, oil shale, peat, and fuelwood. Peat (fuel), oil shale, and fuelwood together accounted for 7.7% of the total Soviet fuel production in 1960, but by 1977 their aggregate share had fallen to an estimated 4.2%. There was, in fact, an absolute increase in the production of these commodities, a trend which is expected to continue into the future.

Electric Power.—Total electric power generation in 1977 amounted to 1,150 (1,160 planned) billion kilowatt-hours (kwhr), a 3% increase over that of 1977. Electric power generation is planned to rise to 1,207 billion kwhr in 1978 and to 1,380 billion kwhr in 1980.

At the beginning of 1978, the total installed capacity of Soviet electric powerplants reached 238 million kilowatts (kw), of which 45 million kw (or 18.9%) represented hydroelectric capacity and 7.3 million kw

Digitized by Google

(or 3%) was nuclear capacity. Most of the future development of electric power capacity will be centered on new thermal powerplants, most of which will be fueled by lignite. There are plans to commission 12 million kw of new electric-power-generating facilities in 1978, comprising 5.9 million kw thermal, 3 million kw nuclear, and 3.1 million kw hydraulic capacity. Under the 1976-80 plan, 71 million kw of new electric-power-generating facilities were to be commissioned and are scheduled to produce 1,380 billion kwhr of electric power annually by 1980. The output of hydroelectric power may reach 197 billion kwhr by 1980. In 1980, the capacity of hydroelectric powerplants may reach approximately 56 million kw. Capital investment in construction of new powerplants for 1976-80 was set at 26 billion rubles, compared with 22 billion rubles under the 1971-75 plan.

Exports of electric power rose from 11.3 billion kwhr in 1975 to 11.5 billion kwhr in 1977 and comprised about 10 billion kwhr to centrally-planned economy countries and over 1.5 billion kwhr to Finland and Norway. Hungary remained the principal importer of Soviet electric power, followed by Bulgaria, Czechoslovakia, and Poland. Under long-term contracts, the U.S.S.R. will export some 15 billion kwhr of electric power annually by 1980, including some 2 billion kwhr to Finland and Norway. Hungary is expected to remain the principal importer of Soviet electric power until 1980. After 1980, the U.S.S.R. will deliver some 4 billion kwhr to Finland annually.

About 85% of all Soviet electrical energy is generated at thermal power stations fueled mainly by lignite as indicated, in percent, in the following tabulation:

Source of fuel	1965	1970	1975	1980
Coal and lignite	60.0	48.6	43.0	45.0
Mazout	11.5	23.0	29.5	28.0
Natural gas	22.1	23.1	22.1	22.0
Peat, oil shale, and other	6.4	5.3	5.4	5.0
Total	100.0	100.0	100.0	100.0

Sources: Elektricheskiye stantsii (Electric Powerplants). Moscow, No. 1, January 1975, p. 3; No. 6, June 1976, p. 5.

Coal and lignite in electric power generation will continue to play a leading role in the foreseeable future, and the share of coal- and lignite-fueled electric power generation is to increase. Up to 75% of the solid fuels burned at the U.S.S.R.'s thermal electric powerplants has a calorific value of 1,500 to 5,500 kilocalories per kilogram (2,650 to 9,850 Btu/lb).

About one-half of the total capacity of hydroelectric power stations of the U.S.S.R. is concentrated at plants with a capacity of over 1 million kw. The largest operating station is the Krasnoyarsk hydroelectric powerplant with a capacity of 6 million kw.

Consumption of power by major branches of the Soviet economy in 1977 and planned for 1978 is shown in the following tabulation:

Consumer	1977		1978 (planned)	
	Billion kwhr	Percent of total	Billion kwhr	Percent of total
Industry and construction	660.9	67.9	685.6	67.2
Transport	86.4	8.9	91.7	9.0
Agriculture and rural population	91.0	9.3	99.5	9.8
Domestic (urban)	135.0	13.9	142.5	14.0
Total	973.3	100.0	1,019.3	100.0

Sources: Elektricheskiye stantsii (Electric Powerplants). Moscow, No. 1, January 1978, pp. 2-3; National Economy of the U.S.S.R. in 1977, Moscow, 1977, p. 201.

Hydroelectric Power.—The economic technical potential of hydroelectric power in the U.S.S.R. was placed at 1,095 billion kwhr per year. In the overall energy economy of the Soviet Union, however, water power is of relatively small significance. Hydroelectric power supplied 145 billion kwhr, or 12.7% of all electric power generated in 1977.

Nuclear Power.—The Soviet Union operated 10 atomic powerplants, with a total capacity of 6,317 megawatts, or about 2.8% of the capacity of all electric powerplants in the country on January 1, 1977, as follows: Novo-Voronezh, four reactors, total capacity 1,455 megawatts; Beloyarsk, two reactors, 300 megawatts; Melekess, one reactor, 72 megawatts; Kola Peninsula, two reactors, 880 megawatts; Shevchenko, one reactor, 150 megawatts; Bilibino, four reactors, 48 megawatts; Obninsk, one reactor, 5 megawatts; Armenia, one reactor, 407 megawatts; Kursk, one reactor, 1,000 megawatts; and Leningrad two reactors, 2,000 megawatts. The first stage (one reactor) at Chernobyl, with a capacity of 1,000 megawatts, was put into operation in September 1977. Therefore, the total installed capacity of all 11 Soviet nuclear powerplants on January 1, 1978, was 7,317 megawatts, or 3% of the total capacity of all electric powerplants in the U.S.S.R.

In 1977, Soviet nuclear powerplants generated over 34 billion kwhr (26 billion more than in 1976), or 3% of all power supplied in 1977. Several nuclear powerplants were under construction in 1977, some of which were scheduled for completion by 1980. Plans are to install 13,750 megawatts of new nuclear capacity by 1980 and to generate 80 billion kwhr of nuclear electricity in 1980. Estimated level of Soviet nuclear generating capacity for 1980 is 15,000 to 17,000 megawatts. The U.S.S.R. will probably increase the production of nuclear power from 34 billion kwhr in 1977 to 50 billion in 1980. Nuclear power output is to represent about 3.6% of national electric power production and 0.3% of total Soviet primary energy output by 1980.

Soviet nuclear energy statistics are presented, in megawatts, in the following tabulation:

Nuclear plant and unit	Began operation	Capacity (megawatts)

[1]The first dual-purpose nuclear powerplant (350,000 kilowatts) using a sodium-cooled fast reactor with a designed capacity of 150,000 kilowatts and desalination capacity of 120,000 cubic meters per day of fresh water.

Source: Elektricheskiye stantsii (Electric Powerplants). Moscow, No. 11, November 1977, p. 15.

The U.S.S.R. provides technical assistance in the construction of nuclear powerplants in Comecon countries. The East European countries operated four nuclear powerplants (six reactors) with a total capacity of 1,970 megawatts on January 1, 1978. German Democratic Republic takes first place among the area's nuclear power producers, followed by Bulgaria and Czechoslovakia. The aggregate capacity of nuclear powerplants operating in the Comecon countries was 9,287 megawatts on January 1, 1978.

East European nuclear energy statistics are presented, in megawatts, in the following tabulation:

Country, nuclear plant, and unit	Began operation	Capacity Jan. 1, 1978
East Germany:		
Rheinsberg	1966	70
Greifswald No. 1	1973	440
Greifswald No. 2	1974	440
Total	--	950
Bulgaria:		
Kozloduy No. 1	1974	440
Kozloduy No. 2	1976	440
Total	--	880
Czechoslovakia: Yaslovske Bohunice	1972	140
Grand total	--	1,970

Construction of nuclear powerplants, with a capacity of 440 megawatts each, continued in Hungary (Paks nuclear powerplant) and Romania in 1977 and scheduled for completion by 1985.

The first nuclear powerplant in Poland, with a capacity of 440 megawatts, is to be built on Lake Zarnowieckie, Gdansk Province, during the 1990's. Cuba's first atomic power station is to be built in Las Villas Province with Soviet assistance. The U.S.S.R. is to supply equipment for the plant, and the generating capacity of its first stage is to be 440 megawatts.

The first stage of the Loviisa nuclear powerplant in Finland, with a capacity of 440 megawatts, was under construction with Soviet assistance in 1977. Under a Finnish-Soviet agreement, the main machinery, reactor units, turbines, and nuclear fuel will be delivered by the Soviet foreign trade organization Atomenergoexport.

Oil Shale.—Shale plays only a minor role in total Soviet energy economy, accounting for 0.65% of production and 0.71% of consumption in 1977. The production of oil shale increased from 35.1 million tons in 1976 to an estimated 35.5 million tons in 1977. The output of oil shale may possibly reach 36 million tons in 1978 and 38 million tons in 1980. Seventy-four percent of the extracted shale in the U.S.S.R. is burned at

Digitized by Google

the thermal powerplants, about 21% is processed into furnace oil, gasoline, fuel gas, phenols, and aromatic hydrocarbons, and over 5% of the total is used in commercial everyday needs. The world's biggest powerplant in Tallin, fueled by shale, has reached a capacity of 1,600,000 kilowatts.

The main center of production, as in prior years, was the Estonian S.S.R., where estimated output totaled over 29 million tons in 1977 and is expected to be 30 million tons in 1980. There were eight underground mines and four open pits in operation in Estonia in 1977. During 1971-75 more than 100 million rubles was invested in the development of the Estonian oil shale industry. Most of Estonia's oil shale comes from a seam at a depth of 20 to 30 meters. An increasing proportion is obtained from open pits.

In 1977, three underground oil shale mines in Leningrad Oblast' produced some 5 million tons. Over 1 million tons of oil shale came from two underground mines in the Volga region.

Total Soviet economically minable oil shale reserves in place in categories A+B+C_1 (measured+indicated+inferred) in January 1978 were 6.4 billion tons, and 6 billion tons was classified as potential (category C_2). The largest oil shale reserves are in Estonia.

The average working thickness of the flat oil shale seams and the depth of mining, according to 1977 data, were as follows:

Basin	Number of workable seams	Seam thickness (meters)			Depth of mining (meters)
		Total	Oil shale	Limestone or clay	
Estonia	1	2.5-3.2	1.8-2.6	0.6-0.7 (limestone)	10-150
Leningrad	1	1.7-1.8	1.0-1.1	0.6-0.7 (limestone)	50-110
Volga region (Kashpira deposit)	1	2.0-2.4	1.1-1.2	0.8-1.2	NA

NA Not available.

Peat.—The share of peat in total Soviet energy output increased from 5.3% in 1940 to 15% during World War II but had dropped to 0.8% in 1977.

The Soviet Union produced an estimated 192 million tons of peat in 1977. Of this quantity, 60 million tons consisted of fuel peat and 132 million tons are agricultural peat. The peat industry of the U.S.S.R. produced 41 million tons (55 million planned) of fuel peat and 34.8 million tons of agricultural peat in 1977. Estimated production of nearly 100 million tons of fuel peat (for domestic use of farmers) came from collective farms. Extraction of peat may reach 220 million tons (including 80 million tons of fuel peat) in 1980.

The Russian Soviet Federated Socialist Republic (R.S.F.S.R.) occupied first place in the production of peat in the U.S.S.R. and produced an estimated 130 million tons, including 42 million tons of fuel peat. During the 1971-75 period, 312 million rubles were invested in the development of the R.S.F.S.R.'s peat industry. The Belorussian S.S.R., with an estimated output of 46 million tons, was the second largest peat-producing region.

Soviet gross reserves of peat on January 1, 1976, were estimated at 166 billion tons (39 billion tons of standard fuel equivalent). However, about 11% of today's minable reserves are located in the Central European part of the U.S.S.R., Belorussia, the Baltic States, and the Ukraine regions, which produced over 80% of the national output in 1977.

Reserves in place and number of peat deposits, by Soviet Union Republic, on January 1, 1976, follow:

Republic	Number of deposits (thousands)	Reserves in place	
		Billion metric tons	Percent of total
R.S.F.S.R.	44.5	153.4	92.4
Belorussian S.S.R.	7.1	5.4	3.2
Estonian S.S.R.	1.0	2.3	1.4
Ukrainian S.S.R.	2.6	2.2	1.3
Latvian S.S.R.	5.1	1.7	1.0
Lithuanian S.S.R.	4.9	.9	.6
Georgian S.S.R.	.1	.1	.1
Total U.S.S.R.	65.3	166.0	100.0

The Mineral Industry of the United Arab Emirates

By Candice Stevens[1]

The economy of the United Arab Emirates, comprising seven emirates, remained almost entirely dependent on the petroleum industry, which contributed more than 95% of total Government revenue. The petroleum income of the three oil-producing emirates—Abu Dhabi, Dubai, and Sharjah—was estimated at $9.7 billion[2] in 1977. The gross national product (GNP) in 1977 was approximately $11.5 billion, an increase of 19% over the 1976 GNP. More than 10% of the 1977 GNP was allocated to the Abu Dhabi Fund for Arab Economic Development (AFAED), established in 1971 to channel foreign aid to other Arab countries. The 1977 Federal budget of the United Arab Emirates was $3.4 billion, most of which was contributed by Abu Dhabi.

Abu Dhabi and Dubai, the largest oil producers and the wealthiest of the emirates, were to use their petroleum revenue in the construction of complete industrial cities. In 1977, Abu Dhabi contracted Fluor Corp. (United States) to provide planning and management services for the construction of infrastructure at Ruweis, situated near the crude oil loading facility at Jebel Dhanna. The industrial area of Ruweis is to include an oil refinery, a natural gas liquids (NGL) plant, a direct-reduction steel mill, a petrochemical complex, and a fertilizer plant. In Dubai, the new industrial city of Jebel Ali is to include an aluminum smelter, an NGL facility, a steel plant, a fertilizer plant, and a petroleum refinery.

In Sharjah, $50 million was allocated to industrial development under the direction of the newly formed investment company Sharjah Group Inc. Sharjah Co. for Heavy Industries was to supervise construction of a plant for the manufacture of steel and its products. Light industries, including a gypsum plant and a brick plant, were to be constructed by Gulf Industries Co.

Hunting Geology and Geophysics Ltd. (United Kingdom) was granted a second contract to do followup studies of a geological survey of the United Arab Emirates completed in 1976. The 15-month project is to include detailed geophysical analyses, mapping, and drilling. It is intended to evaluate the accessibility and quality of deposits of copper, chrome, sulfur, lead, and magnesium discovered during the 1975-76 survey.

PRODUCTION

Petroleum production increased slightly to approximately 2 million barrels per day in 1977. Abu Dhabi remained the largest producer, with an output of 1.65 million barrels per day. The other two producing emirates were Dubai (319,000 barrels per day) and Sharjah (28,000 barrels per day). Reserves in the three emirates were estimated at 32.4 billion barrels. Plans were made to exploit recent oil and gas discoveries in Ras al-Khaimah and Umm al-Qaiwain.

Marketed natural gas production in 1977 was approximately 3.2 billion cubic meters in Abu Dhabi and 0.7 billion cubic meters in Dubai. Trial production of NGL was initiated at Abu Dhabi's Das Island facility in mid-1977. Natural gas reserves in Abu

Digitized by Google

Dhabi, Dubai, and Sharjah were estimated at 630 billion cubic meters. The only other mineral commodity produced in quantity in 1977 was cement for use by local construction industries.

Table 1.—United Arab Emirates:[1] Production of mineral commodities[2]

Emirate, commodity, and unit of measure	1975	1976	1977[p]
ABU DHABI			
Cement thousand metric tons	--	200	200
Gas, natural:

Marketed do	(4)	(4)	(4)
Petroleum, crude thousand 42-gallon barrels	13,943	13,542	10,293

[e]Estimate. [p]Preliminary.
[1]In addition to the emirates listed, Fujairah and Umm al-Qaiwain record no mineral production but presumably produce small quantities of crude construction materials.
[2]In addition to the commodities listed, crude construction materials (common clays, stone, and sand and gravel) presumably are also produced, but output is not recorded quantitatively and available general information is inadequate to make reliable estimates of output levels.
[3]Includes gas reinjected to reservoirs, if any.
[4]No marketed production reported; there is probably some small field use.

TRADE

Mineral trade consisted primarily of crude oil exports and imports of refined petroleum products and construction materials. The United Arab Emirates' balance-of-payments surplus was estimated at $5.5 billion in 1977. Almost all crude oil production was exported, principally to Japan, the United States, and Western Europe. The principal suppliers of imported goods were Japan (18%), the United Kingdom (17%), and the United States (14%).

Nearly 70% of imports were handled by Port Rashid in Dubai. Expansion of existing facilities and construction of seven new ports were expected to relieve congestion at United Arab Emirates terminals. The largest drydock in the world is scheduled to open in 1978 in Dubai, a new deepwater port was under construction at Jebel Ali, and Port Rashid was being expanded by five berths. In Abu Dhabi, new deepwater ports were to be constructed at Mina Zayed and Ruweis. An intermodal transportation system under development in Sharjah is to comprise two specialized container terminals at Port Khalid and Khor Fakkan. In Ras al-Khaimah, a deepwater port being built at Khor Kuwait is to be completed in 1978. In Umm al-Qaiwain, widening and deepening of the main port and construction of two new piers was in progress.

Abu Dhabi National Tanker Co. (ADNATCO) placed three general cargo ships on order to increase its total fleet capacity to 731,000 deadweight tons.

COMMODITY REVIEW

METALS

Aluminum.—Construction began on the Dubai Aluminium Co. (DUBAL) smelter at Jebel Ali, Dubai. The smelter is to commence production in 1979 at 135,000 tons per year, rising to 180,000 tons per year by the early 1980's. Alcoa of Australia Ltd. is to supply 200,000 tons per year of alumina feedstock for a 10-year period. The Sunningdale Oils Ltd. gas plant under construction at Jebel Ali is to supply approximately 60 million cubic feet per day of dry gas to fuel the smelter. DUBAL was owned 80% by the Dubai government, 7.5% by Southwire Co. (United States), 7.5% by Nissho-Iwai Co., Ltd. (Japan), and 5% by various local interests.

Iron and Steel.—Feasibility studies were being conducted for a 400,000-ton-per-year direct-reduction steel mill for the new industrial city at Ruweis in Abu Dhabi. The plant, scheduled for startup in 1980, is to be fueled by associated natural gas from Abu Dhabi's onshore oilfields.

The Gulf Iron and Steel Co. plant in the al-Rashidiyah region of Dubai was commissioned in 1977. The plant, which produced iron and steel from scrap material, is to be expanded from the current capacity of 100 tons to 200 tons per day of reinforced iron bars by 1979. The plant used slag iron from the People's Republic of China, magnetite from Austria, and limestone from Pakistan.

NONMETALS

Cement.—The United Arab Emirates had a cement production capacity of approximately 920,000 tons per year, concentrated in three plants as follows:

Company	Location	Capacity (thousand metric tons per year)
Ittihad (Union) Cement Co	Al Ain, Abu Dhabi	200
	Ras al-Khaimah	500
Sharjah Cement Co	Sharjah	220

Cement production capacity was being expanded to meet heavy demand from the United Arab Emirates construction industry. Bids were being accepted from foreign companies for expansion of the Ittihad (Union) Cement Co. plant at Al Ain, Abu Dhabi. A factory to produce 56,000 tons per day of brick was under construction at Al Saad, near Al Ain.

In Ras al-Khaimah, cement production capacity is to reach 1 million tons per year by 1979 with the construction of a new cement plant at Khor Kuwait. The plant, which is to have a capacity of 1,400 tons per day, is to be built by Ishikawajima-Harima Heavy Industries Co., Ltd. (IHI) of Japan.

Construction of the Dubai National Cement Co. Ltd. plant by Costain Civil Engineering (United Kingdom) continued on schedule, with startup planned for mid-1978. The plant is to have a capacity of 500,000 tons per year.

Construction began in September on an asbestos cement factory in Umm al-Qaiwain. The plant, which is to have a capacity of 40,000 tons per year of asbestos cement pipes, is to use imported asbestos and domestic limestone and gypsum.

Fertilizer Materials.—Abu Dhabi National Oil Co. (ADNOC) solicited bids for construction of a fertilizer complex for the Ruweis industrial area. The plant, which would use natural gas from Abu Dhabi's onshore fields as feedstock, is to produce 2,000 tons of ammonia and 1,500 tons of urea per day. Feasibility studies for the complex were completed in 1977 by SNAM Progetti S.p.A., a subsidiary of Ente Nazionale Idrocarburi (ENI) of Italy. The project is expected to go onstream in 1981.

MINERAL FUELS

Natural Gas.—The Das Island natural gas liquefaction facility operated by Abu Dhabi Gas Liquefaction Co. Ltd. (ADGLIC) was inaugurated on October 4. Designed to utilize 550 million cubic feet per day of associated gas from Abu Dhabi's offshore oilfields, the plant's annual capacity was 15 million barrels of liquefied natural gas (LNG), 5.6 million barrels of liquefied petroleum gas (LPG), 1.5 million barrels of light distillate, and 1.6 million barrels of pelletized sulfur. The entire production of LNG and LPG was earmarked for Tokyo Electric Power Co., Ltd., under an agreement con-

Digitized by Google

cluded in December 1972.

In 1977, ADNOC issued contracts for construction of an NGL facility at Ruweis to process associated gas from Abu Dhabi's onshore oilfields. The required investment of $1.2 billion was to be financed entirely by the Abu Dhabi government after the failure of a former financing venture with the foreign partners in Abu Dhabi Petroleum Co. Ltd. (ADPC). Fluor Corp. was contracted to design and supervise gas-gathering facilities at the Bab, Bu Hasa, and Asab Fields. Bechtel Corp. (United States) was contracted for the design, procurement, and construction of two natural gas processing plants. The facility is to produce 185,000 barrels per day of NGL for export as well as dry gas to fuel powerplants and industrial projects in the Ruweis area. The facility, to be located in Jebel Dhanna, is expected to be in operation by 1980.

Dubai Natural Gas Co. (DUGAS), a joint venture of the Dubai government and Sunningdale, let contracts during the year for construction of an NGL-processing plant at Jebel Ali. The facility is to process 125 million cubic feet per day of associated gas from the offshore Fateh and Southwest Fateh Fields. Oceanic Contractors Inc., a subsidiary of J. Ray McDermott & Co., Inc. (United States), was contracted for design and engineering work on the NGL extraction plant and shipping facilities. The plant is to produce 7.3 million barrels per year of propane, butane, and natural gasoline. C. Itoh & Co., Ltd. (Japan) contracted to purchase nearly 60% of the output for a 15-year period. Dry gas sales were designated for the aluminum smelter under construction at Jebel Ali.

DUGAS also concluded an agreement during the year with the Umm al-Qaiwain government for development of a gasfield discovered offshore Umm al-Qaiwain in 1976. The bulk of output from the gasfield, which is to come onstream in 1979, is to be piped to the Jebel Ali aluminum smelter for use as fuel; a small proportion of production is to be reserved for use in Umm al-Qaiwain. DUGAS further agreed to finance the engineering and construction costs of a power and desalting plant in Umm al-Qaiwain.

Petroleum.—*Abu Dhabi.*—Government-owned ADNOC maintained 60% participation in the two major oil companies, ADPC and Abu Dhabi Marine Areas, Ltd. (ADMA). In April, a formal agreement was concluded between ADNOC and the shareholders of ADMA giving the Abu Dhabi government effective participation in planning and decisionmaking in proportion to its 60% shareholding. ADNOC continued to market increasing quantities of crude oil on its own account and announced plans to further reduce the quantity of crude oil sold back to the two concessionaire companies in 1978.

ADNOC scheduled a change in petroleum production ceilings, which were first imposed in 1974 for conservation purposes. Allowable output for the ADPC fields is to be reduced from 1,035,000 barrels per day in 1977 to 850,000 barrels per day in 1978. The ADMA production ceiling is to be lowered from 550,000 barrels per day in 1977 to 500,000 barrels per day in 1978.

Onshore, ADPC continued development drilling and water injection programs to maintain production capacity in its four fields, all linked by pipeline to the loading facilities at Jebel Dhanna. Production from the Bab, Bu Hasa, Asab, and Sahil Fields was maintained at the 1976 level of 1,020,000 barrels per day in 1977. The new Shah Field, located south of the Asab Field, is to be brought onstream in 1979 with an initial production capacity of 50,000 barrels per day.

Offshore, the Umm Shaif and Zakum Fields operated by ADMA increased production 16% to 521,000 barrels per day in 1977. Work began on the installation of a supercomplex to give a water injection capacity of 500,000 barrels per day at the Zakum Field; a similar water injection scheme was completed in 1976 at the Umm Shaif Field.

Abu Dhabi's three other producing offshore oilfields were under development to increase production capacity. The Abu Al Bu Koosh Field, operated by a consortium including Sunningdale and Amerada Hess Corp., evidenced a decrease in output to 74,000 barrels per day in 1977. Production at the smaller Mubarraz Field, operated by the Japanese consortium Abu Dhabi Oil Co., Ltd. (ADOCO), was approximately 21,000 barrels per day in 1977. The El Bunduq Field, owned jointly by British Petroleum Co. Ltd. (BP), Cie. Française des Pétroles (CFP), and United Petroleum Development Co., Ltd., of Japan, produced 19,000 barrels per day in 1977; associated gas was delivered to the Das Island natural gas liquefaction plant.

Production from Amerada Hess' Arzanah Field is scheduled to begin in late 1978.

Digitized by Google

Twelve development wells were completed in 1977 as part of a $140 million development program. Discovered in 1973, the Arzanah Field is to have an initial production capacity of 40,000 barrels per day.

ADNOC concluded joint venture agreements to develop three other offshore oilfields. Zakum Development Co. was formed by ADNOC (88%) and Japan Oil Development Co. (JODCO) (12%) to exploit the Upper Zakum Field. CFP was designated as operator of the field and was to provide personnel, management expertise, and equipment on a fee basis, with an option to purchase a proportion of output. Production from the Upper Zakum Field is expected to reach 350,000 barrels per day. JODCO also acquired a 12% share in the Saath al-Razboot and Umm al-Dalkh Fields, which are to begin production in 1979 with CFP as operator. Saath al-Razboot is expected to have a production capacity of 100,000 barrels per day, while output from Umm al-Dalkh is to total 50,000 barrels per day.

ADNOC's 15,000-barrel-per-day refinery on Umm al-Nar Island is to be expanded to 50,000 barrels per day by 1979. SNAM Progetti was contracted for construction of a $500 million refinery at Ruweis. Scheduled for completion at yearend 1980, the refinery is to have a production capacity of 120,000 barrels per day of petroleum products.

Table 2.—Abu Dhabi: Exports of crude oil, by destination

(Thousand 42-gallon barrels)

[r]Revised.

Source: Organization of Petroleum Exporting Countries, Statistics Unit. Annual Statistical Bulletin 1977 (Vienna). 1978, p. 74.

Ajman.—No exploration activity was reported in 1977. United Refining Co. (United States), the last concession holder in Ajman's offshore area, dropped its concession in late 1975.

Dubai.—The Fateh and Southwest Fateh Fields, owned by Dubai Petroleum Co. (DPC), produced 319,000 barrels per day of crude oil in 1977. Expansion of the water injection system in the two fields is to raise production capacity from 345,000 barrels to 460,000 barrels per day.

DPC continued development of the Falah and Rashid Fields, situated west of the Fateh Field near the Abu Dhabi offshore boundary. The Falah Field is expected to have an initial production capacity of 15,000 barrels per day of crude oil. The Rashid Field is expected to produce 20 million cubic feet per day of nonassociated gas and some condensate for use in the Jebel Ali industrial area. A third discovery west of the Fateh Field tested 2,500 barrels per day of oil from two zones in 1977.

Houston Oil & Minerals Corp. (50%), in conjunction with Southeastern Drilling Co. (50%), acquired a 6,000-square-kilometer concession area in Dubai during 1977. The area included 4,000 square kilometers onshore and 2,000 square kilometers offshore, both having been relinquished by Texas Pacific Dubai Inc. Geophysical work was scheduled to begin in mid-1978 in both the onshore and offshore acreage.

Fujairah.—Reserve Oil & Gas Co. (United States), which held a 1,500-square-kilometer concession in the Gulf of Oman, drilled its first well approximately 18 kilometers off Fujairah's eastern coast. Further development drilling was scheduled for 1978.

Ras al-Khaimah.—Ras al-Khaimah Oil Co. (RKOC) commissioned J. Ray McDermott to carry out engineering studies for production installations at two offshore

Digitized by Google

oil discoveries. During 1977, RKOC acquired a 50% interest in the fields discovered by an international consortium operated by Deutsche Schachtbau- und Tiefbohrgesellschaft mbH (Federal Republic of Germany). Drilling was in progress on both the B-1 well, which tested 4,000 barrels per day of oil, and the A-1 well, which tested 2,500 barrels per day of oil and 17 million cubic feet per day of gas.

RKOC (51%) and Kuwait National Petroleum Co. (49%) formed a joint venture for construction of a petroleum refinery in Ras al-Khaimah. Kellogg Co. (United States) was commissioned to prepare a feasibility study for the refinery.

Sharjah.—Production from the Mubarek Field, operated by Crescent Petroleum Co., declined from 37,500 barrels per day in 1976 to 30,000 barrels per day in 1977. A gas-lift system was being installed at Mubarek to boost flow to the targeted output of 60,000 barrels per day. At yearend, Sharjah unilaterally raised the tax rate from 55% to 77% and the royalty rate from 12.5% to 14.5% on the Mubarek Field, retroactive to July 1, 1976. The new provisions were the subject of negotiations between Crescent and the Sharjah government.

Umm al-Qaiwain.—The Umm al-Qaiwain Oil Group, with Zapata Exploration Co. (United States) as operator, conducted followup studies on two oil and gas discoveries in the offshore area. One well tested 130 barrels per day of oil and 15 million cubic feet per day of gas, and the other tested 345 barrels per day of oil and 26 million cubic feet per day of gas. Onshore, Houston drilled several wells without commercial discovery.

The Mineral Industry of the United Kingdom

By William F. Keyes[1]

Growing North Sea oil production brought about a significant improvement in Britain's financial environment in 1977; exports were strong and the exchange rate firmed, foreign currency reserves grew, and interest rates declined. However, the basic performance of the real economy, apart from the peripheral but vital oil sector, remained disappointing, and industrial production failed to demonstrate any strength. The experience of the United Kingdom in this regard was similar to that of other countries, such as the Netherlands and Norway, that found sudden wealth in natural resources to be a mixed blessing.

The United Kingdom continued to be deficient in most of the major extracted minerals. Only in energy sources (coal, crude oil, and natural gas) and ultimately perhaps in potash, was the supply picture promising. The country possessed, however, a major minerals processing capacity and was a major world source and consumer of iron and steel products, nonferrous metals, and processed nonmetallic minerals of domestic and foreign origin, such as potash, clay, fertilizers, and cement. During the year a possible major domestic source of tungsten was explored, a significant petroleum find was made onshore, growth in offshore petroleum activity continued strong, and coal mine development proceeded apace.

PRODUCTION

By yearend, production of crude oil from North Sea fields was close to 1 million barrels per day, equivalent to half the country's consumption, and production was increasing steadily to an expected self-sufficiency early in the 1980's.

Production of other United Kingdom major minerals and metals was less satisfactory. Coal production was at the lowest nonstrike level since World War II; steel production and sales were disastrously low; and the sole potash mine (the largest other than coal and iron) was beset with severe production problems.

[4]Year ending May 31 of that stated.

[5]Excludes plasters.

[6]Consists of bricks, retorts, molds, and other refractory products made from clays, silica, siliceous material, magnesite, alumina, and chrome materials.

[7]Less than 1/2 unit.

[8]Gas made at gas works plus purchased coke oven refinery gas.

TRADE

As a major world trading nation and processor of raw materials, the United Kingdom's economy is closely related to that of the United States. The United Kingdom ships steel semimanufactures and processed nonferrous metals to the United States and receives in return coking coal, ferrous scrap, aluminum, copper, phosphate rock, and lubricants. As shown in table 4, the value of United States-United Kingdom minerals trade, as defined by the entries, totaled $1.2 billion in 1976. The minerals commodity trade of the United Kingdom in 1975-76 is given in tables 2-3.

Table 2.—United Kingdom: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Bauxite and concentrate	396	97	NA.
Oxide and hydroxide	24,669	43,024	Sweden 9,267; Spain 4,686.
Metal including alloys:			
Scrap	16,720	7,021	West Germany 3,132; Netherlands 1,685.
Unwrought	87,695	162,085	Netherlands 68,096; Belgium-Luxembourg 20,788; West Germany 19,102.
Semimanufactures	54,313	62,486	France 6,524; Ireland 5,683; West Germany 5,139.
Antimony metal[1]	NA		
Arsenic trioxide, pentoxide, acid	2,608	2,325	New Zealand 1,319.
Beryllium metal including alloys, all forms	6	3	NA.
Bismuth metal including alloys[1]	r313	285	NA.
Cadmium metal including scrap[1]	r165	105	NA.
Chromium:			
Chromite	2,851	965	NA.
Oxide and hydroxide value, thousands	r$1,844	$911	NA.
Metal including alloys, all forms	r3,900	3,900	NA.
Cobalt:			
Oxide and hydroxide	149	634	NA.
Metal including matte, speiss, etc.[1]	r600	2,000	NA.
Columbium and tantalum metal including alloys, all forms: Tantalum	63	5	NA.
Copper:			
Ore and concentrate	r30	NA	
Metal including alloys:			
Scrap	35,323	38,772	West Germany 15,953; Italy 13,656.
Unwrought	43,754	32,980	West Germany 9,150; France 3,295.
Semimanufactures	122,578	101,907	Switzerland 14,664; Ireland 9,079; Sweden 8,244.
Gold, unworked or partly worked:			
Bullion refined thousand troy ounces	r16,532	18,121	NA.
Other do.	r9	3	NA.
Iron and steel:			
Ore and concentrate, except roasted pyrite	249	383	NA.
Metal:			
Scrap thousand tons	916	599	Spain 197; Italy 184; West Germany 95.
Pig iron, ferroalloys, and similar materials do.	61	104	Italy 15; West Germany 9; Netherlands 8.
Steel, primary forms do.	256	258	Italy 80; West Germany 46; United States 38.
Semimanufactures:			
Bars, rods, angles, shapes, sections:			
Wire rod thousand tons	160	209	United States 30; Turkey 23; Sweden 20.
Other bars and rods do.	530	661	United States 96; West Germany 75.
Angles, shapes, sections do.	542	582	United States 155.
Universals, plates, sheets:			
Universals and heavy plates, uncoated do.	181	302	West Germany 236; United States 38; India 33.

See footnotes at end of table.

Table 2.—United Kingdom: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Iron and steel —Continued			
Metal —Continued			
Semimanufactures —Continued			
Universals, plates, sheets — Continued			
Medium plates and sheets, uncoated thousand tons	10	25	Ireland 9.
Light plates and sheets, uncoated do	298	305	Sweden 52; United States 32.
Tinned plates and sheets do	206	231	India 36; Argentina 17; Greece 17.
Other coated plates and sheets do	147	205	Norway 31; Sweden 19; West Germany 16.
Hoop and strip do	99	122	France 12; Ireland 12; West Germany 11.
Rails and accessories do	136	129	New Zealand 21; France 13.
Wire do	111	113	United States 23; Canada 16.
Tubes, pipes, fittings do	562	565	Sweden 42; Netherlands 40; Ireland 36.
Castings and forgings, rough do	70	60	United States 21; Sweden 14.
Total do	3,052	3,509	
Lead:			
Ore and concentrate	10,414	9,272	Belgium-Luxembourg 3,789.
Oxides	8,265	8,321	Ireland 2,939; Sweden 970.
Metal including alloys:			
Scrap	19,069	11,599	Italy 5,597; Ireland 2,525.
Unwrought	106,606	103,665	West Germany 21,495; Netherlands 17,999; Portugal 11,053.
Semimanufactures	3,203	2,446	NA.
Magnesium metal including alloys:			
Scrap	303	259	NA.
Unwrought	1,166	968	France 429; United States 190.
Semimanufactures	530	636	Republic of South Africa 83.
Manganese:			
Ore and concentrate	3,803	8,087	NA.
Oxides	4,079	2,205	West Germany 128.
Mercury 76-pound flasks	1,479	1,131	NA.
Molybdenum metal including alloys, all forms	128	121	Netherlands 26.
Nickel:			
Matte, speiss and similar materials	774	72	Norway 25.
Metal including alloys:			
Scrap	4,042	5,543	West Germany 2,192; Sweden 708.
Unwrought	31,484	29,669	West Germany 8,631; France 4,485; Sweden 3,882.
Semimanufactures	10,385	10,101	West Germany 1,282; France 1,127.
Platinum-group metals and silver:			
Ore and concentrate value, thousands	r$8	$50	NA.
Waste and sweepings do	r$4,507	$3,569	West Germany $1,088; Belgium-Luxembourg $354.
Metals including alloys:			
Platinum group thousand troy ounces	1,029	1,286	United States 418; West Germany 257; Japan 257.
Silver:			
Refined do	r51,036	68,613	NA.
Other do	1,256	247	NA.
Tin:			
Ore and concentrates	2,819	185	Spain 90.
Oxides	745	540	United States 106; Brazil 66.
Metal including alloys:			
Scrap	68	99	NA.
Unwrought	14,574	10,235	Netherlands 3,049; U.S.S.R. 1,063.
Semimanufactures	1,013	1,001	Norway 223; Sweden 57.
Titanium oxides	6,246	10,502	Ireland 1,256; Japan 1,190; Poland 1,017.
Tungsten:			
Ore and concentrate	189	206	West Germany 29.
Metal including alloys, all forms	687	337	West Germany 138.
Uranium and thorium metals including alloys, all forms kilograms	6,000	6,000	NA.
Zinc:			
Ore and concentrate	25,280	7,495	Sweden 7,480.
Oxide and peroxide	7,808	9,300	Belgium-Luxembourg 2,236.
Metal including alloys:			
Scrap	5,240	3,966	West Germany 1,476; France 1,114.
Unwrought	17,877	13,205	Netherlands 2,139; Ireland 2,126; Portugal 1,515.
Semimanufactures	4,240	3,587	Ireland 1,004.

Table 2.—United Kingdom: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Other:			
Ore and concentrate:			
Of molybdenum, tantalum, titanium, vanadium, zirconium	r18,113	2,551	Belgium-Luxembourg 456; France 201.
Of base metals, n.e.s. value, thousands	r$186	$5	NA.
Ash and residue, containing nonferrous metals	49,184	45,539	West Germany 20,603; Canada 9,396; Belgium-Luxembourg 5,783.
Oxides, hydroxides, and peroxides of metals, n.e.s	99,754	47,407	Spain 18,545; Italy 8,694.
Metals including alloys, all forms:			
Metalloids, n.e.s. value, thousands	r$2,392	$1,401	Republic of South Africa $57.
Alkali, alkaline earth, and rare-earth metals	171	68	NA.
Pyrophoric alloys	567	353	NA.
Base metals including alloys, all forms, n.e.s	7,326	7,630	United States 2,587; France 967.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	5,584	3,120	NA.
Dust and powder of precious and semiprecious stones value, thousands	r$7,761	$3,564	Ireland $663; Japan $548; Netherlands $514.
Grinding and polishing wheels and stones	8,010	8,205	West Germany 994; Sweden 970.
Asbestos, crude and waste	1,698	1,996	NA.
Barite and witherite	3,993	6,629	NA.
Boric oxide and acid	256	154	NA.
Cement thousand tons	1,121	1,036	Ivory Coast 248; Nigeria 172.
Chalk	35,976	45,263	Nigeria 6,553.
Clays and clay products (including all refractory brick):			
Crude clays, n.e.s thousand tons	2,190	2,487	West Germany 408; Italy 391; Finland 296.
Products:			
Refractory (including nonclay brick) do	341	261	Italy 44; Sweden 34.
Nonrefractory do	89	97	Canada 11; Australia 10; United States 8.
Cryolite and chiolite	NA	1	NA.
Diamond, all grades value, millions	r$1,695	$726	Switzerland $275; Belgium-Luxembourg $223; United States $83.
Diatomite and other infusorial earth	1,863	2,220	NA.
Feldspar and fluorspar	51,275	37,164	Norway 19,487; Netherlands 4,748.
Fertilizer materials:			
Crude:			
Nitrogenous	340	142	NA.
Phosphatic	141	96	NA.
Potassic	11	NA	
Other	2,824	2,475	NA.
Manufactured:			
Nitrogenous thousand tons	154	140	Ireland 59; Netherlands 23.
Phosphatic	r118,466	136,993	Bangladesh 64,839; Ireland 28,580.
Potassic	4,428	24,070	NA.
Other including mixed	406,254	453,112	Ireland 129,560; Belgium-Luxembourg 102,611; West Germany 64,450.
Graphite, natural	2,795	1,717	NA.
Gypsum and plasters	r14,721	15,204	NA.
Lime	37,210	38,395	Nigeria 14,344; Ireland 4,593.
Magnesite	48,385	42,126	Poland 12,155; Netherlands 8,003; West Germany 2,091.
Mica:			
Crude including splitting and waste	1,603	2,500	NA.
Worked including agglomerated splitting	156	190	France 17.
Pigments, natural:			
Natural crude	3,681	4,392	NA.
Iron oxides, processed	8,199	7,728	Nigeria 101; Iraq 64.
Precious and semiprecious stone, except diamond:			
Natural value, thousands	r$44,628	$16,937	Switzerland $5,550; Hong Kong $2,446; West Germany $1,943.

Table 2.—United Kingdom: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Precious and semiprecious stone, except diamond —Continued			
Manufactured value, thousands	r$162	$147	NA.
Salt thousand tons	519	576	Sweden 190; Nigeria 138.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	250,740	271,874	Australia 142,026.
Caustic potash, sodic and potassic peroxides	310	733	NA.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	6,221	13,687	NA.
Worked	11,976	6,989	NA.
Dolomite, chiefly refractory grade	12,086	10,790	NA.
Gravel and crushed rock thousand tons	4,105	4,618	Belgium-Luxembourg 1,656; Netherlands 1,385; France 1,222.
Limestone (except dimension)	9,500	15,418	NA.
Quartz and quartzite	110	328	NA.
Sand excluding metal bearing	69,841	71,561	Ireland 21,047; Norway 8,062.
Strontium minerals, celestite[1]	r1,300	3,800	NA.
Sulfur:			
Elemental:			
Other than colloidal	1,941	1,768	NA.
Colloidal	75	195	NA.
Sulfur dioxide value, thousands	r$51	$16	NA.
Sulfuric acid	165,831	44,525	Ireland 33,991; Morocco 5,247.
Talc, steatite, soapstone, pyrophyllite	1,642	2,894	NA.
Other nonmetals, n.e.s.:			
Crude	r820,716	803,182	Norway 234,061; Belgium-Luxembourg 205,130; West Germany 171,196.
Slag, dross and similar waste, not metal bearing:			
From iron and steel manufactures	138,441	145,950	West Germany 138,415.
Slag and ash, n.e.s	2,470	1,911	NA.
Oxides and hydroxides of magnesium, strontium, barium	30,531	10,881	West Germany 3,603; Sweden 1,693.
Halogens other than chlorine	1,840	1,637	West Germany 378; Switzerland 190; France 188.
Building materials of asphalt, asbestos and fiber cement, and unfired nonmetals, n.e.s	74,342	106,857	NA.
MINERAL FUELS AND OTHER RELATED MATERIALS			
Asphalt and bitumen, natural	1,379	2,898	NA.
Carbon black	32,200	42,536	Ireland 7,449.
Coal and briquets:			
Anthracite and bituminous coal thousand tons	2,182	1,436	France 460; Belgium-Luxembourg 263; West Germany 253.
Briquets of anthracite and bituminous coal do	284	233	Norway 211.
Lignite and lignite briquets	80	466	NA.
Coke and semicoke thousand tons	1,315	948	Sweden 261; Norway 229; Netherlands 117.
Hydrogen and rare gases	1,072	3,353	NA.
Peat including peat briquets and litter	1,786	1,580	NA.
Petroleum:			
Crude and partly refined:			
Crude thousand 42-gallon barrels	r5,320	22,834	Sweden 4,256; Ireland 4,074; West Germany 3,843.
Partly refined do	r1,939	574	Netherlands 465.
Refinery products:			
Gasoline (including natural) do	r20,664	21,293	Ireland 5,304; Netherlands 4,803; Sweden 4,624.
Kerosine and jet fuel do	r5,999	6,371	Ireland 2,984; Denmark 1,031; Norway 674.
Distillate fuel oil do	r41,619	46,185	Denmark 10,593; Netherlands 9,042; Sweden 8,667.
Residual fuel oil do	r24,895	35,158	Ireland 8,731; Sweden 5,548; Denmark 4,276.
Lubricants do	r4,482	5,096	West Germany 581; Algeria 448.

Table 3.—United Kingdom: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal sources, 1976
METALS			
Aluminum:			
Bauxite and concentrate thousand tons	296	297	Ghana 197; Greece 53.
Oxide and hydroxide do	558	526	Jamaica 283.
Metal including alloys:			
Scrap do	14	17	Ireland 1.
Unwrought do	160	218	Norway 110; Iceland 31.
Semimanufactures do	79	162	United States 23; West Germany 14; Belgium-Luxembourg 12.
Arsenic trioxide, pentoxide, acids	5,120	4,879	Republic of South Africa 1,725.
Beryllium metal including alloys, all forms	8	6	All from United States.
Bismuth metal including alloys, all forms[1]	r353	327	NA.
Cadmium metal including alloys, all forms[1]	r913	1,309	NA.
Chromium:			
Chromite thousand tons	144	138	Republic of South Africa 103.
Oxide and hydroxide value, thousands	r$370	$318	U.S.S.R. $101.
Cobalt:			
Oxide and hydroxide	884	807	Canada 782.
Metal including alloys, all forms[1]	r2,200	2,300	NA.
Columbium and tantalum: Tantalum metal including alloys, all forms	27	57	United States 31; Belgium-Luxembourg 7.
Copper:			
Ore and concentrate	r307	1459	NA.
Matte	NA	32	NA.
Metal including alloys:			
Scrap	10,237	13,135e	Ireland 3,044; Chile 1,100; United States 1,063.
Unwrought	451,858	433,914	Zambia 89,290; Canada 87,944; Chile 79,398.
Semimanufactures	23,895	34,092	West Germany 7,749; France 5,802; Finland 4,084.
Gold, unworked or partly worked:			
Bullion:			
Refined thousand troy ounces	15,407	19,373	NA.
Unrefined do	311	228	NA.
Other do	1	1	NA.
Iron and steel:			
Ore and concentrate, except roasted pyrite thousand tons	15,783	18,589	Canada 3,821; Sweden 3,201; Brazil 3,186.
Roasted pyrite do	304	225	Sweden 198.
Metal:			
Scrap do	88	694	United States 473; West Germany 83.
Pig iron including cast iron, sponge, powder, and shot do	88	221	Norway 36; Finland 24; Brazil 23.
Ferroalloys:			
Ferromanganese do	96	118	Republic of South Africa 54; Norway 46.
Other do	230	271	Norway 111; Sweden 44.
Steel, primary forms do	622	940	West Germany 151; Netherlands 131.
Semimanufactures:			
Bars, rods, angles, shapes, sections:			
Wire rods do	141	138	Netherlands 36; West Germany 25; France 19.
Other bars and rods do	277	301	Norway 53; Sweden 46; Netherlands 34.
Angles, shapes, sections do	r100	161	Belgium-Luxembourg 22; Japan 20; Ireland 17.
Universals, plates, sheets:			
Heavy and medium plates and sheets, uncoated do	689	590	West Germany 123; Italy 92; Sweden 84.
Light plates and sheets, uncoated do	853	1,085	Netherlands 283; West Germany 229; Belgium-Luxembourg 154.
Tinned plates and sheets do	57	142	Netherlands 71; France 21.
Other coated plates and sheets do	145	277	West Germany 99; Belgium-Luxembourg 59; France 32.
Hoop and strip do	106	80	West Germany 26; Poland 15; Sweden 9.

COMMODITY REVIEW

METALS

Aluminum.—Production increased somewhat over 1976, but demand slackened in the latter half of the year and stocks increased.

Three large smelters comprised the United Kingdom's aluminum industry: The Anglesey plant of Kaiser Aluminum & Chemical Corp. (67%) and Rio Tinto-Zinc Corp. Ltd. (RTC) (33%), with nominal capacity of 100,000 tons of virgin aluminum per year; the Lynemouth, Northumberland, plant of Alcan Aluminium Ltd. (100%), capacity 120,000 tons annually; and the Invergordon, Scotland, plant of the British Aluminium Co. Ltd., with capacity of 100,000 tons per year. British Aluminium also operated two smaller plants at Kinlochleven (10,000 tons) and Fort William (30,000 tons) both in Scotland.

The Anglesey plant of Kaiser-RTZ, at Holyhead, operated above its nominal 100,000-ton capacity during the year, signifying an end to the operating difficulties that had plagued most of its 7-year life.

There was no production of bauxite in the United Kingdom. Alumina for the operating plants was imported from Jamaica and Australia. Some alumina was also produced from imported bauxite at the Burntisland plant of British Aluminium near Edinburgh, which had a capacity of 125,000 tons of product per year.

Copper.—Imperial Chemical Industries (ICI) decided to sell to the public the 63% of Imperial Metal Industries Ltd. (IMI) that it held; this amounted to 130.9 million shares valued at about £65 million.[3] IMI controlled IMI Refiners Ltd. which operated the copper refinery at Walsall, near Birmingham.

Iron and Steel.—In 1977, the 10th anniversary year of nationalization of the steel industry, the British Steel Corp. (BSC), successor of 14 large private companies, was facing severe difficulties. After moderate profitability in the late 1960's and early 1970's, a loss of $446 million was suffered in the year to March 1976, a loss of $165 million in the following year, and in the year to March 1978, the financial hemorrhage was expected to approach $1 billion.

The year started with a moderate increase in orders, but by summer it became clear that the worldwide steel recession was persisting, especially in Europe. BSC depended upon the export market for about 3 million tons annually out of its production of under 20 million tons, and it was hoped to increase this to 6 million tons annually, but the chance of reaching this goal disappeared as world steel markets were increasingly characterized by depressed demand, excess capacity, and extreme price competitiveness.

BSC's difficulties essentially related to "overstaffing," or surplus employees, which any nationalized industry would find difficult to correct, and to inefficient plants, which have not been modernized as fast as those of competitor countries. Internal rigidity and management problems were also reported to be contributing factors. A few facts highlight the situation: Capacity utilization was 60% to 65%, compared with an excessively high breakeven point of 90%; employment, at about 205,000, was 60,000 in excess of that needed; productivity in terms of steel production per work-hour was 40% that of Japan, 49% of that of the United States, and 61% of that of France; and steel imports had increased from 10% to 40% of consumption in the 10 years since nationalization.

In 1977, the BSC was midway in the ambitious program of expansion and modernization begun in 1973-74, that has required substantial borrowing from both private and public sources. The original strategy aimed at producing at least 35 million tons of steel annually in the early 1980's, of which 20% would be exported. It was becoming increasingly clear that exports could not reach this figure, and that in the competitive market actual exports would hardly be profitable, thus calling the whole expansion strategy into question.

During the year the BSC reached the borrowing limits allowed to it in the private market and was forced to rely exclusively on Government funds. It was predicted that Government support of the expected magnitude would require 6% to 7% of the whole public sector borrowing during the fiscal

Digitized by Google

year to March 1978, and BSC's chairman stated publicly that the corporation would be in receivership if it had been a private sector company. Support on such a level left the BSC vulnerable to charges of subsidies by other European Community nations, although many other countries' producers also received some form of Government aid. It also left the BSC open to possible dumping complaints and countervailing duties in the United States.

Four possible options seemed open to the British Government to meet the problem of BSC's losses: To cut back on the massive ongoing modernization program; capital restructuring of BSC, that is, a Government writeoff of BSC's capital; a reduction of employees; and rapid closure of inefficient plants. A House of Commons Select Committee was to complete recommendations on these and other points early in 1978.

BSC produced about 85% of domestic steel in 1977; the private sector, located largely in the Midlands and based on scrap melting, produced about 15%, or some 3 million tons of crude steel. In some products, such as bright bars, cold rolled strip, forgings, tubes, and pipes, the private sector's contribution was between 60% and 99%. Deliveries of finished steel by the 120 companies in the private sector were also high, being approximately 6.5 million tons; in contrast to BSC, private sector companies avoided losses, although encountering stiff import competition.

One new steel plant was opened by the private sector during the year. The Alphasteel project in Newport, South Wales, was commissioned by Halyvourghiki S.A., the Greek steelmaking firm, with the start in July of the first of four electric furnaces. The production target for 1978 was around 800,000 tons of raw steel, and about 650,000 tons of finished products, including about 250,000 tons of plates, 250,000 tons of sheet in coil, and 150,000 tons of hot strip and tube strip.

The £90 million scheme to produce reduced iron by direct reduction with North Sea gas of imported ore, largely from the Republic of South Africa, was abandoned by the North Sea Iron Co., a consortium of multinational partners (not BSC as originally reported). Consolidated Gold Fields Ltd., the largest partner, attributed the action to the continued depression in the steel industry. The capacity of the project, to have been located at Jarrow, near Newcastle, would have been at 800,000 tons annually, making it the world's largest direct reduction plant using the Thyssen Purofer process.

Lead and Zinc.—Force Crag Mines (UK) Ltd., controlled by New Force Crag Mines Ltd. of Toronto, started exploration and development work on its Force Crag mine at Braithwaite, west of Keswick, Cumbria, late in the year. Early in 1978, planning permission was granted by the local authority, the Special Planning Board of the Lake District. It was hoped to start operations by the end of 1978.

One primary lead-zinc smelter operated during the year; this was the Imperial Smelting Furnace of Commonwealth Smelting Ltd. at Avonmouth, near Bristol, which had a design capacity of 90,000 tons of zinc and 40,000 tons of lead annually. In addition, a lead refinery at Northfleet, east of London, operated by Britannia Lead Co. Ltd., had a capacity of about 150,000 tons of refined lead per year from ore originating at the Mt. Isa mine in Australia.

Tin.—The Cornish tin mines were buoyed up during the year by favorable tin prices and continued investment in additional facilities.

The Mount Wellington mine of Cornwall Tin & Mining Ltd., encountered severe water influx problems, at times reaching 5,000 gallons per minute, and installed new pumps with a calculated excess capacity; a crosscut was also driven to the shaft of the inoperative United mine to lower the water level and assist in drainage.

The Wheal Jane mine of Consolidated Gold Fields Ltd., also a neighbor of Mount Wellington, carried on a £4 million development program, including deepening the mine shaft, new hoisting and pumping facilities, and the use of a raise borer in development. The new stopping area of the mine was found to be high in zinc. Copper was also present, and a new section was added to the concentrator to produce copper and zinc concentrates. Plans for the future included mining of 200,000 tons of ore per year to produce concentrates containing 1,000 tons of tin, 400 tons of copper, 6,000 tons of zinc, and 80,000 ounces of silver annually. Tin concentrate was sent to the Copper Pass smelter in East Yorkshire, copper concentrate to Boliden A.B. in Sweden, and zinc concentrate to smelters in Belgium. Apart from its Wheal Jane mine, Consolidated Gold Fields was investigating two other potential tin areas; Porkellis Moor, between Camborne and Helston; and Red Moor, between St. Austell and Bodmin, where tin

Digitized by Google

mining has never been carried out.

St. Piran Ltd., a parent company of South Crofty Ltd. (largest United Kingdom tin mine), sold 35% of the subsidiary's capital to the public; it was heavily oversubscribed. St. Piran also operated the smaller Pendarves tin mine and was investigating the possibility of reopening the old Lambriggan lead-zinc mine between Truro and Perranporth.

The fourth of the major tin producers, Geevor Tin Mines Ltd., at Pendeen, near St. Just, allocated additional capital to continue its subincline project, which was to provide access to additional ore reserves lying offshore.

Tungsten.—The tungsten-tin prospect at Hemerdon, near Plymouth, owned by Hemerdon Mining and Smelting Ltd. of Bermuda, was the object of a joint venture entered into between Hemerdon and Amax Exploration Inc. of the United Kingdom. Under the agreement Amax had the option of acquiring a half share in the ore body in return for completing an agreed program of work and paying Hemerdon an undisclosed sum of money. Hemerdon had earlier completed the first phase of exploration at the property by drilling a total of 3,600 feet in 45 holes, confirming estimates that the ore body contained reserves of some 5.6 million short tons assaying 3.6 pounds of tungsten per short ton and 1 pound of tin per short ton. In the second phase, before deciding to proceed, Amax was to drill an additional 4,000 to 6,000 feet to depths of 400 to 500 feet; this would be followed, in a third phase, by an additional 9,000 feet of drilling and pilot-processing plant work.

St. Piran Ltd., the Cornish tin producer, received permission to conduct drilling at the former wolframite deposit at Castle an Dinas, north of St. Austell in Cornwall, last worked in 1956; it was hoped that the lode, averaging 0.5% to 2.5% WO_3, extends north from the worked part of the mine.

NONMETALS

Cement.—Some 31 cement plants operating in the United Kingdom in 1977 had a total kiln capacity of 19,192,000 tons at yearend. Associated Portland Cement Manufacturers Ltd., was the largest producer, with a total kiln capacity of 11,492,000 tons in 16 plants, the largest of which was the 4-million-ton plant at Northfleet, Kent, east of London. A total of seven companies, including Associated, manufactured cement in the United Kingdom.

Clays.—After 7 years of environmental opposition, ECC Ball Clays, a subsidiary of English China Clays Ltd., won the right from the Secretary of State for the Environment for the winning and working of ball clays on the Arne Peninsula of Dorset, west of Bournemouth. ECC will exploit an area of 44 acres subject to stringent conditions.

Fertilizer Materials.—*Nitrogen.*—Shellstar Ltd. (UKF Fertilizers), controlled by DSM of the Netherlands, was granted planning permission for the construction of an ammonia plant at Ince Marshes, across the Mersey River from Liverpool. If the company decided to go ahead, this would be the second plant at the site and would boost capacity by 272,000 tons per year of ammonia to over 500,000 tons.

After several years of delays, the Scanitro ammonia project at Peterhead, Scotland, was abandoned, at least for the foreseeable future, by its sponsors, Norsk Hydro AS of Norway and Supra AB of Sweden; the depressed market was given as the reason. The plant was to have produced 360,000 tons per year of ammonia with natural gas from the Anglo-Norwegian Frigg field in the North Sea.

ICI Ltd., the dominant British producer of ammonia with 80% of British capacity, reached a settlement with British Gas Corp. for continued supplies of natural gas at 6 to 7 pence per therm (100,000 Btu's), double the earlier long-term contract price. This would make it easier for Shellstar (18% domestic capacity) and Nitrogas Fertilizers Ltd. (2%) to compete, because they also were paying the higher price.

Potash.—The trouble-plagued Cleveland Potash Ltd. mine at Boulby, in the North Yorkshire Moors National Park, was advanced a further £20 million, bringing total spending on the project by the parent companies, Charter Consolidated Ltd. and ICI Ltd., to £105 million, about four times the original estimate. The money was to be used to develop more working areas underground. The rate of production did not reach 25% of capacity (which was nominally 1 million tons of product) by yearend, but there was nevertheless a continued improvement. Continuous miners were introduced, a new method of drilling ahead of the face was instituted, and water spray coolers were installed to reduce the high temperatures underground. But then the operation received yet another blow when dangerous quantities of gas were found associated with shale horizons in the potash seam, and one

Digitized by Google

miner was killed in a related explosion.

After taking over Whitby Potash Ltd. early in the year from Shell Petroleum, Consolidated Gold Fields Ltd. appealed against refusal of the National Park Committee to extend planning permission for a potash mine near Cleveland. Local government agencies supported Gold Fields' plans to produce 450,000 tons per year of KCl and 500,000 tons per year of common salt (NaCl) by solution mining, followed by precipitation of the salts in a refinery to be built at Stainsacre, just southeast of Whitby and some 4 miles southeast of the minefield pumphouses.

Fluorspar.—The Hopton, Derbyshire, flotation plant southwest of Matlock, which was shut down in 1976 by the former operators (the Giulini group) was purchased for £1,425,000 by Dresser Minerals International. Dresser started to reequip the plant to handle 1,000 tons per day of ore (equivalent to about 80,000 to 100,000 tons per year of acid-grade fluorspar product) and expected to commence production in the second quarter of 1978. The plant, which was renamed the Ryder Point plant, has facilities to recover barite and lead-zinc concentrates. Dresser also acquired mining rights to over 10,000 acres of land in areas close to the plant.

The largest United Kingdom producer of fluorspar was Laporte Industries Ltd. at Stoney Middleton (Blakedon), also in Derbyshire, where both acid and metallurgical fluorspar were produced in the central Cavendish mill. The company consumed much of the acid fluorspar in its own hydrofluoric acid plant at Rotherham. Swiss Aluminium Mining (UK) Ltd. (SAMUK) purchased the 20,000-ton-per-annum acidspar Weardale plant of ICI Ltd., during 1977; the plant is located at Rookhope, County Durham. SAMUK was also continuing construction on the 60,000 to 70,000-ton-per-year processing plant at Broadwood Quarry, Frosterley, County Durham, scheduled for completion in January 1979.

The other large producer in County Durham was the BSC, which operated the Blackdene, Groverake, and Whiteheaps mines, as well as the Beaumont mine at Allenheads, Northumberland, all of which produce metallurgical-grade fluorspar A new 70,000-ton-per-year briquetting plant was under construction at Blackdene, with completion scheduled for mid-1979.

In addition to the four large fluorspar producers, there were at least six smaller producers near Laporte in Derbyshire and two small producers in Yorkshire.

MINERAL FUELS

The United Kingdom was becoming less dependent on imported fuels, in spite of a lackluster performance in 1977 by the coal mining industry. By yearend, the petroleum production of the North Sea reached half the domestic consumption, or almost a quarter of total energy consumption. A summary of the supply and consumption pattern is given in table 5.

Table 5.—United Kingdom: Supply and apparent consumption of fuels and power

(Million tons of standard coal equivalent[1])

	Total primary energy	Coal and coke	Petroleum and refinery products	Natural gas	Hydro electric and nuclear power
1975:					
Production	171.8	110.6	2.3	46.0	12.9
Imports[2]	164.7	4.5	159.1	1.1	--
Exports[2]	39.5	[3]11.8	[3]27.7	--	--
Apparent consumption	297.0	103.3	[4]133.7	47.1	12.9
1976:					
Production	187.6	106.2	17.7	48.8	14.9
Imports[2]	156.9	2.8	152.8	1.3	--
Exports[2]	39.6	[3]4.3	[3]35.3	--	--
Apparent consumption	304.9	104.7	[4]135.2	50.1	14.9

Coal.—The estimated 1977 coal output was about 118 million tons, the lowest post-World War II level, except in major strike years. Reversal of the continuing decline was proving difficult but was seen to depend largely upon productivity, available work force, and environmental constraints, and to a much lesser extent on availability of capital. In the post-war era, coal had been displaced so thoroughly by Middle East oil that even in the 1970's, and following the oil crisis, output and productivity failed to increase. In spite of the unsatisfactory production record, a somewhat anomalous financial surplus of £27 million was recorded in the year to March 1977, after a smaller surplus in the preceding year.

It had become apparent in recent years that the original Plan for Coal, which called for production of 135 million tons by 1985, was too optimistic and during 1976 a target of 120 million tons, just barely maintaining capacity, was adopted. By 1977 the planning figure generally accepted was 170 million tons by the end of the millenium, for an expenditure of £3,700 million.

This figure was to be reached by development of two major new coal mining areas: Selby, in Yorkshire, now expected to cost £400 million and produce 10 million tons annually by 1985-86; and the Vale of Belvoir, an area in North Leicestershire where three mines were to be developed at Hose, Ashfordby, and Saltby, to yield some 7 million annual tons, at a development cost of around £500 million.

While Selby was proceeding on schedule, various obstacles were hindering progress on the Vale of Belvoir mines. Opposition on environmental grounds was strong, not only against the coal industry in general, but also because of the rural nature of the Vale, which residents feared would be destroyed by coal mining. A further argument was advanced on economic grounds; in the near future prospects for increased coal usage were not bright, in either steel or electricity generation, because of reduced energy demand compared with the high demand of a few years earlier, and coal from the Vale might not be needed.

Other areas came in for a share of attention as well. Drilling for oil in the North Sea had revealed large reserves of exploitable coal in seams averaging 3 to 14 feet and reaching as much as 50 feet in thickness. According to the Department of Energy, these reserves, lying at 5,000 to 11,000 feet below the seabed, which itself was several hundred feet below the surface, could probably be exploited only by in situ gasification. In the Forest of Dean, Gloucestershire, 0.5 million tons of coal could be mined when a fortuitous storm destroyed the scenic forest cover. The National Coal Board (NCB) also was empowered by passage of the Coal Industry Act by Parliament to take part in overseas mining projects; in a venture with Australian interests, the NCB won exploration rights for a 200-million-ton coalfield near German Creek, Queensland, which would produce 3 million tons per year by 1981.

All coal in the United Kingdom was produced by the NCB, a nationalized company organized into 12 semiautonomous areas (plus a small independent field in Kent); everyday operations, negotiations with labor unions, and lesser capital expenditures were controlled by the Area Director. There were 243 "deep mine" units in these areas, employing 240,000 workers and producing 110 million tons of coal. In addition, a number of opencast mines were operated by private contractors.

Natural Gas.—Late in the year the first gas from the northern basin of the North Sea, where it is largely associated with oil, was delivered by pipeline from the Anglo-Norwegian Frigg field to St. Fergus near Peterhead, Scotland. A second pipeline from Frigg to St. Fergus was to be ready in 1978 to deliver gas from the Norwegian installations in the field. Some 700 miles of high-pressure pipe had been laid through Scotland and northern England to connect the St. Fergus terminal to the national gas transmission system. Frigg gas was expected to cost twice as much as gas from the southern North Sea basin.

A consultative group, Gas Gathering Pipelines (North Sea) Ltd., was formed by British Gas (the sole distributor of gas), British National Oil Corp., and five private companies, (British Petroleum Co. Ltd., ICI, RTZ, and France's Total and Elf) to study pipeline options for gathering gas from a number of fields in the northern North Sea. A report by Williams Merz, Consulting Engineers, which was commissioned by the United Kingdom Department of Energy, was to be considered. The group was to submit an initial report by yearend and a final report by March 31, 1978. Among the options available was a first stage linking of the Thistle, Murchison, and Ninian fields in the north to the Brent system, and linking the more southerly fields in the northern

Digitized by Google

basin, Piper and Tartan, to the Frigg system.

About 97% of the gas supplied in Great Britain came from the southern basin of the North Sea. The Frigg field and nearby fields will lower this figure. Production at the Hewitt field, one of the most important in the southern field, also passed its peak and started to decline after being in operation since 1969, but two nearby reservoirs were to offset this to some extent.

Petroleum.—After 2 years of steadily growing production, the United Kingdom's output, mostly from North Sea fields, was about 1 million barrels per day at yearend, equivalent to half of the consumption. The 1977 total was about 38 million tons (279 million barrels). In October, the Claymore field became the eighth field (out of 14 declared commercial) to come into production, and at that time the fields in the United Kingdom sector were as follows:

Field name	Major ownership (percent)	Date of startup	Estimated recoverable reserves (million tons)
Argyll	Hamilton Bros. (36). RTZ Texaco (24)	June 1975	22
Forties	BP (96) Shell/Esso (4)	November 1975.	240
Auk	Shell (50) Esso (50)	February 1976.	8
Beryl	Mobil (50) Amerada (20) Texaco Eastern (20).	June 1976	70
Montrose	Amoco (30.77) British Gas (30.77). Amerada (23.08) Texas Eastern (15.38).	June 1976	20
Brent	Shell (50) Esso (50)	November 1976.	230
Piper	Occidental (36.5) Getty (23.5) Allied Chemical (20). Thomson (20)	December 1976.	95
Claymore	Occidental (36.5) Getty (23.5) Allied Chemical (20). Thomson (20)	October 1977	57

The Thistle field, operated by the British National Oil Co. (BNOC) for an eight-member consortium, did not reach production as scheduled because of holdups in construction.

Decisions to develop several fields were made during the year. BP decided to develop the small Buchan field, 100 miles east of Aberdeen, 1 month after buying a 54.16% majority stake in the consortium; reserves were estimated at between 115 and 250 million barrels. Output will be between 50,000 and 100,000 barrels per day, starting hopefully late in 1978. BP also decided to go ahead with the Magnus field for production in the early 1980's. Reserves were put at 400 million barrels. Pan Ocean Oil Corp., a subsidiary of Marathon Oil Co., signed a participation agreement with the British Government under which the BNOC will be entitled to 51% of the production if the Brae field is found to be commercial. Reserves at Brae were estimated roughly between 200 and 700 million barrels.

Texaco Ltd. announced plans to begin producing oil in the Tartan field, 115 miles northeast of Aberdeen, in late 1979 or early 1980; capacity will be about 75,000 barrels per day of oil and 12,000 barrels per day of natural gas liquids, plus natural gas.

The Beatrice field (block 1-30), located in shallow water 12 miles offshore in the Moray Firth, was to be developed through offshore loading, without a pipeline, by the operator, the Mesa Petroleum Group, if approval was obtained from the Department of Energy. An early estimate of reserves was 400 million barrels.

Discovery of a new field, named Fulmar, was announced by Shell and the Esso subsidiary of Exxon. The field was located in relatively shallow water about 170 miles east of Dundee, Scotland, in the center of the British North Sea fields. The field is near the Auk field, but in a different formation, and reserves were thought to be larger. Production startup was slated for 1981, and production could reach 150,000 barrels per day, depending on the size of the reserves.

Onshore, an apparently commercially viable oilfield was discovered late in the year by British Gas/BP at Wytch Farm, near Corfe Castle, Dorset, on the south coast. Early estimates put recoverable reserves at

Digitized by Google

50 million barrels; peak production of about 10,000 barrels per day would be reached in 1979. This would make it the largest onshore field in the United Kingdom and larger than the smallest North Sea fields now in production. A second oil-bearing reservoir was also discovered below the first Wytch Farm field.

Increased attention was given during the year to the West Shetland basin, west of the Shetland Islands, following a strike of heavy crude by BP in block 206-8, in 435 feet of water about 45 miles west of the oil terminal at Sullom Voe in Shetland. Sedimentary structures in the area are known to be large but are apparently thin. Late in the year Texaco was reported to have found oil in the area, and just after yearend a noncommercial oil and gas find was made by a consortium led by the Elf Co. of France. Activity was stimulated because licenses in the area had to be relinquished in the spring of 1978.

In the Fifth Round of oil-concession awards, and the first since 1972, the Government conditionally gave licenses to 65 companies to explore for and produce petroleum and natural gas on about 9,000 square kilometers of offshore tracts in 44 blocks in the North Sea, Irish Sea, Cardigan Bay, English Channel, and west of Scotland. The licenses were conditional upon the companies reaching operating agreements with BNOC. The largest awards went to BP, almost 69% owned by the British Government, which received 13 blocks. Other large recipients of conditional licenses were Texaco, Inc., and the Royal Dutch-Shell group.

Noteworthy was the requirement in the licenses that the BNOC be a 51% partner in the leases. BNOC, the agency organized early in 1976 through which the Government intended to play an active part in offshore oil production, obtained a loan for $825 million from a group of U.S. and British banks to finance its prospecting and development of North Sea oil and to redeem some of its initial debt to the British Treasury; the BNOC operated as a private concern and held between 12% and 33.3% interest in five major North Sea fields, in addition to its prospective share of 51% of Fifth Round fields.

Proposals for new terms and conditions for onshore petroleum production licenses were published on December 15. They included provision for 51% State participation and royalties reaching 12.5% on production over 200,000 tons (1.4 million barrels) per year. In 1977, there existed 53 onshore production licenses covering 7,151 square kilometers, most issued between 1966-72; production onshore was about 700,000 barrels in the year.

Agreement was reached with France on the location of the national boundary line in the English Channel and the Western Approaches when both parties accepted the decision of an international arbitration court in Geneva. The decision gave an approximately equal share of the disputed 40,000 square miles to each country, but full effect was not given to the Scilly Isles and the Channel Islands. The British Government later decided to question the boundary line on the grounds that the cartographer had drawn part of it about 4 miles too far north.

Despite surplus capacity already existant in the United Kingdom and in the European Community (EC) as a whole (overall European refinery utilization was about 60% in 1977, and in the United Kingdom it was between 60% and 70%), oil refinery expansion continued. Reasons for the expansion were to be found in the desire of the British Government not to export more than one-third of North Sea oil as crude in order to provide employment and increase the value of exports; and, in the case of certain expansions, to adapt capacity to market needs, which were shifting towards the lighter end of the barrel, that is, gasoline and distillate fuel oils.

Approval of the national Government, although not always of the local authorities, was obtained during the year for a number of projects. Occidental Petroleum Co. revived its plans for a 120,000-barrel-per-day complex at Canvey Island in the Thames estuary, costs for which are likely to exceed £200 million; Texaco and Gulf were to construct a 70,000-barrel-per-day catalytic cracking unit at Milford Haven, Wales, to service the existing refinery capacity of both companies in the area; Esso and Shell were planning similar units with capacities ranging from 20,000 to 30,000 barrels per day; and Burmah Oil and Total were studying plans for a joint 120,000-barrel-per-day refinery in Kent, along the Thames estuary, that would emphasize production of lighter products. These actions were taken despite suggestions by other members of the EC that decisions about capacity be coordinated with them.

As of yearend, there were 19 refineries operating in the United Kingdom with a

Digitized by Google

total crude capacity of 2.91 million barrels per day. The three largest refining companies were: Shell, with four refineries (one small) and a total capacity of 690,000 barrels per day; Esso, with 657,000 barrels per day in two refineries; and BP, with 541,000 barrels per day in four refineries.

The Mineral Industry of Venezuela

By Doris M. Hyde[1]

Vertical development and diversification continued to characterize the strategy and emphasis of the overall plan for growth for Venezuela's mineral and related industries. Despite the downward trend in crude oil production and export volumes, petroleum remained the major single contributor to the economy. In 1977, petroleum export sales amounted to $9.2 billion,[2] or 94% of total export earnings. The petroleum industry was estimated to have accounted for 28% of the gross domestic product (GDP) and 73% of total Government revenues, excluding borrowings. Venezuela's ambitious fifth national plan (1976-80) relied heavily on petroleum-generated revenues to provide funds for infrastructure and basic mineral industry development and expansion programs.

The coal-mining industry, still in an early stage of development, has yet to establish uncontested coking properties of various coals, as it must to qualify as an integral part of Venezuela's expanding steel industry. The fortuitous discovery of large bauxite reserves will complement the new alumina plant and enable Venezuela to develop a fully self-sufficient aluminum industry. Eventually, cessation or very substantial reductions in bauxite and alumina imports will aid the troublesome foreign trade imbalance, probably somewhat to the detriment of current supplying countries, which have generally been suffering the consequences of a depressed market, increased competition, and their own foreign trade deficits. The domestic aluminum industry should protect Venezuela from the marketing problems experienced by other countries producing bauxite and alumina.

In late 1976, Andean Pact members established a new investment code in response to pressures from those members that had determined they needed to attract additional foreign capital. Significant changes included increases in the profit and dividend remittance ceilings and the ceiling on automatic reinvestment of profits. Also, the new code permitted foreign investment in national firms, provided that the company's capital was increased and that it maintained a national or mixed status. This was an important change because such investment was previously permitted only if the company remained national.

During 1977, Venezuela, apparently guided by the new Andean Pact Decisions, initiated legislative changes that may signal a slightly more open attitude toward foreign investment. These policy modifications have not altered Venezuela's basic attitude of favoring a complementary rather than competitive role for foreign investment. The Government's less restrictive position was evidenced by the announcement that private capital participation—including foreign—was being sought for the country's second integrated steel complex, Siderúrgica del Zulia.

Changes in some provisions of the Mining Law of December 28, 1944, were made early in 1977. These changes affected the requirements for obtaining concessions for exploration and subsequent exploitation, and increased the discretionary power of Government authorities in granting these concessions. Foreign capital was not barred, although it remained subject to the established foreign investment laws.

Government Policies and Programs.—The first official Venezuelan reaction to the modified Andean Pact foreign investment

Digitized by Google

code came in June 1977 when the Venezuelan Congress approved, but did not formally ratify, Andean Pact Decision 103. Prior to this, in February, Venezuela issued Decree 2031 modifying the regulations of Decree 62 which defined the economic sectors reserved for national control and required affected foreign companies to convert to national ownership. The new Decree extended the deadline from May 1977 to December 1977 for establishment of an 80% Venezuelan interest in certain foreign-owned companies. Additional extensions could be obtained by written application to the Superintendencia de Inversiones Extranjeras (SIEX). The Decree provided for various exemptions from this transformation to majority Venezuelan ownership, primarily in the domestic marketing sector. Foreign participation, limited to a maximum of 49%, would now be accepted in engineering design and consulting firms previously restricted to national ownership. The latter change indicated a sensitivity to the need for additional technical skill to support planned industrial expansion and development.

In December 1977, Decree 2442, Regulations for the Treatment of Foreign Capital, was announced as the replacement for Decree 63, incorporating many of the provisions of Andean Pact Decisions 103 and 109. One of the major changes followed Decision 103 and increased the ceiling on automatic reinvestment of profits for foreign companies, including the mineral extraction and processing industries, from 5% to up to 7% of invested capital, and increased the ceiling for profits remitted abroad from 14% to 20% of invested capital. Decree 2442 also clarified procedures for using any excess profits and provided means for their local reinvestment or use by the company for local operating capital; consequent interest and dividends were not considered part of the 20% limit imposed on profits remitted abroad. In addition, the Decree allowed some exceptions to the 20% profit remittance, especially concerning new economic activities related to national development priorities. Another concession to foreign investors was that SIEX could authorize technology contracts for periods of up to 15 years instead of the 5 years allowed by Decree 746. Royalty payments between the parent company and affiliates can now be made provided that the majority foreign-owned subsidiaries have signed transformation agreements with SIEX.

Through the years, various changes have been made in the Mining Law of December 28, 1944. The most recent change came in February 1977 with the issuance of Presidential Decree 2039, which declared all of Venezuela to be a reserve zone with respect to exploration for and exploitation of all minerals not otherwise provided for in the Mining Law or included in reserve zones by regulations of the Ministry of Energy and Mines (formerly the Ministry of Mines and Hydrocarbons) or other Presidential decrees. The new Decree also outlined certain factors to be considered in awarding future mineral concessions, including the technical and economic capabilities of the applicant; the applicant's willingness to manufacture or refine the mineral within the country; agreement to a tax regime acceptable to the tax authorities; provision of technology to the mining industry and its transfer to the country; acceptance of the obligation that upon extinction of the concession, regardless of reason, the assets involved will revert to the nation; and acceptance of any other special provisions considered convenient to the protection of the national mining industry. The new Decree did not distinguish between Venezuelan and foreign nationals, although the regulations and restrictions regarding hydrocarbons and iron ore remained in effect. The Ministry of Energy and Mines has yet to issue a resolution clarifying the Decree and establishing implementation procedures.

PRODUCTION

Petroleum and iron ore production remained the major contributors to Venezuela's 1977 mineral industry. Crude oil production was down slightly from that of 1976, with an average of 2.2 million barrels per day. Natural gas liquids production declined 2% to about 78,425 barrels per day. Natural gas production, almost all of which is associated, increased slightly.

Total light- and medium-gravity oil production dropped 7% from revised 1976 levels, while production of heavy-gravity oil increased 9%. Venezuela's oil development plans were designed to stop—if not reverse—this trend toward increased heavy oil production once satisfactory progress is made in the exploration and development operations of Petróleos de Venezuela S.A.

Digitized by Google

(PDVSA, popularly known as PETROVEN).

The general worldwide recession in the steel market that began in 1975 continued to be reflected in Venezuela's declining iron ore production. Other sectors of the country's mineral industry exhibited a mixed performance during 1977 and had no noticeable effect on the total economy.

TRADE

In 1977, Venezuela dropped from fifth to seventh place in world export of crude oil and refined products. It was the second consecutive year that Venezuela failed to rank as the largest supplier of U.S. petroleum imports, again surpassed by Saudi Arabia and Nigeria. This was a consequence of the rapid increase in U.S. crude oil imports and the overall decline in total Venezuelan crude oil exports. Direct petroleum-related exports to the United States averaged 707,000 barrels per day in 1977, a slight increase over 1976 exports. Refined products accounted for 58% of these U.S. imports. Almost one-third of Venezuelan petroleum exports, primarily crude oil, were shipped to Caribbean refineries; about half of this was reexported to the United States in the form of refined products. Thus, through direct and indirect importation, the United States accounted for about one-half of total Venezuelan petroleum exports. Through the marketing authority that PDVSA granted to Corp. Venezolana del Petróleo S.A. (CVP), Lagoven S.A., and Maraven S.A., Venezuela directly sold over 500,000 barrels of petroleum per day to some 50 nontraditional customers, an amount equal to about 25% of total petroleum exports. The remaining 75% was handled through marketing agreements with former concessionaires.

Venezuelan exports of petroleum and petroleum products, by principal area of destination, during 1975-77 are shown in the following tabulation, in thousand 42-gallon barrels:[2]

Destination	1975	1976	1977
Western Hemisphere:			
Canada	98,798	102,779	90,600
Curaçao and Aruba	176,762	196,104	158,821
Puerto Rico	44,648	46,018	47,392
United States	250,260	252,488	257,981
Other	102,937	94,547	101,871
Total	673,405	691,936	656,665

Other	--	644	--
Total	87,684	88,135	60,142
Undifferentiated	355	194	40
Grand total	761,444	780,265	716,847

Source: Ministry of Energy and Mines. Memoria y Cuenta Año 1975, 1976, 1977 (Caracas). March 1978.

Rising prices somewhat compensated for the steady decline in iron ore exports, which dropped to 11.9 million tons in 1977. Although this represented a 26% decrease from 1976 exports, the $242.5 million realized represented only a 6% decline from the value of 1976 iron ore export sales. The United States remained the principal market, accounting for 54% of 1977 iron ore exports, down 3% from that of 1976.

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS —Continued			
Iron and steel:			
Ore and concentrate thousand tons	19,850	16,140	United States 9,200; Italy 1,888.
Metal:			
Pig iron, ferroalloys, similar materials	(1)	77	All to Dominican Republic.
Steel, primary forms	(1)	21	Mainly to Trinidad and Tobago.
Semimanufactures	1,649	20,373	Singapore 6,546; Nigeria 4,100; Hong Kong 3,153; Spain 2,480; Algeria 2,410.
Nickel metal including alloys, all forms	23	55	Mainly to United States.
Platinum-group metals and silver, waste and sweepings troy ounces	r4,565	5,465	All to United States.
Zinc metal including alloys, all forms	r298	236	United States 125; Brazil 89.
Other:			
Ash and residue containing nonferrous metals, n.e.s	(1)	3	All to Netherlands.
Oxides, hydroxides, peroxides of metals, n.e.s	r137,871	196,019	United States 62,896; Denmark 89,535; Brazil 39,389; Italy 19,853.
Metals including alloys, all forms, n.e.s	1	1	All to Netherlands.
NONMETALS			
Abrasives, natural:			
Pumice, emery, natural corundum, etc	3	1	All to Netherlands Antilles.
Grinding and polishing wheels and stones, n.e.s kilograms	r4,639	28,207	Mainly to Trinidad and Tobago.
Asbestos	(1)	--	
Cement, hydraulic	35,759	92	All to Netherlands Antilles.
Clays and clay products (including all refractory brick):			
Crude clays, unspecified	(1)	10	All to Colombia.
Products:			
Refractory	1,548	1,382	Argentina 972; Ecuador 319.
Nonrefractory	598	404	Puerto Rico 261; Netherlands Antilles 140.
Diamond, gem thousand carats	1,240	765	Netherlands 430; United States 245.
Fertilizer materials:			
Crude	3	5	All to Netherlands Antilles.
Manufactured	6,838	46,694	Brazil 26,747; Colombia 11,939; Peru 6,000.
Gypsum and plasters	16,960	17,800	Trinidad and Tobago 14,400; Surinam 3,400.
Lime	66	14	Brazil 7; Netherlands Antilles 7.
Precious and semiprecious stones, except diamond value, thousands	r$69	--	
Salt	975	(1)	All to Netherlands Antilles.
Sodium and potassium compounds, n.e.s	2,068	--	
Stone, sand and gravel:			
Dimension stone	1,962	1,465	Netherlands Antilles 570; St. Lucia 498.
Crushed and broken stone for cement and lime manufacture	114	351	All to Netherlands Antilles.
Quartz and quartzite	85	60	All to Poland.
Sand	2,995	481	Mainly to Trinidad and Tobago.
Sulfur:			
Elemental	7,419	18,931	Mainly to Colombia.
Sulfuric acid	13,859	15,976	Netherlands 5,989.
Other: Building materials of asphalt, asbestos, and fiber cement, and unfired nonmetals, n.e.s	1,277	2,880	Mainly to Netherlands Antilles.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	20,493	75,061	Argentina 50,779; Brazil 18,813.
Hydrogen, helium, rare gases	6	19	Colombia 16; Netherlands Antilles 3.
Natural gas liquids:			
Natural gasoline thousand 42-gallon barrels	3,894	3,505	United States 2,378; Netherlands 652.
Liquefied petroleum gas do	10,907	12,019	United States 6,781; Argentina 1,630.
Petroleum:			
Crude and partly refined do	541,310	502,065	Netherlands Antilles 171,696; United States 130,035; Canada 84,238.
Refinery products:			
Gasoline and naphtha do	15,739	19,136	United States 12,944.
Jet fuel do	3,136	3,360	United Kingdom 1,046; Peru 1,009; United States 544; Netherlands 336.
Kerosine do	--	106	All to Honduras.
Distillate fuel oil do	25,109	20,941	Sweden 3,397; United Kingdom 1,836.
Residual fuel oil do	166,001	221,827	United States 159,503; Netherlands Antilles 22,597.
Lubricants do	2,208	1,366	Brazil 403; Sweden 331; France 217.
Asphalt do	529	81	Dominican Republic 42; Guatemala 15; Bahamas 9; Bermuda 9.

Oxide and acid	702	242	United States 207; West Germany 32.
Salts	r1,269	1,224	Mainly from United States.
Cement	29,337	592,384	Spain 233,534; Mexico 162,403; France 84,813.
Chalk	518	468	France 418.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite	7,419	19,233	Mainly from United States.
Kaolin	16,542	24,530	United States 21,616; United Kingdom 2,708.
Other	3,756	4,692	Mainly from United States.
Products:			
Refractory (including nonclay brick)	7,666	19,697	United States 17,735.
Nonrefractory	16,377	52,959	Italy 29,092; Colombia 16,948.
Cryolite and chiolite	11	23	West Germany 18; Denmark 5.
Diamond:			
Gem, not set or strung, thousand carats	770	150	Mainly from Netherlands.
Industrial, do.	485	2,140	Belgium-Luxembourg 1,100; United States 975.
Diatomite and other infusorial earth	3,978	4,193	United States 2,655; Mexico 1,426.
Feldspar, leucite, nepheline, nepheline syenite	r201	696	United States 413; Finland 80.
Fertilizer materials:			
Crude	4	1	Mainly from United States and France.
Manufactured:			
Nitrogenous	250,966	217,446	Belgium-Luxembourg 88,664.
Phosphatic	4,587	--	
Potassic	22,859	8,816	Mainly from Austria.
Other	71	6	Mainly from West Germany.
Ammonia	r20	22	West Germany 15; United Kingdom 3; United States 2.
Fluorspar	390	5,429	Mexico 2,818; United States 2,501.
Graphite, natural	279	405	United States 287; Spain 92.
Gypsum and plasters	589	569	West Germany 240; United States 140; United Kingdom 112.
Iodine	7	12	United States 5; West Germany 2; United Kingdom 2; Japan 1; Netherlands 1.
Lime	60	127	All from United States.
Magnesite	8,691	377	Czechoslovakia 308.
Mica:			
Crude, including splittings and waste	412	282	Mainly from United States.
Worked, including agglomerated splittings	7	7	United States 5; Italy 1; Japan 1.
Pigments, mineral:			
Natural, crude	56	15	United Kingdom 10; United States 3.
Iron oxides, processed	1,228	1,273	Spain 399; Netherlands 310; West Germany 266.
Precious and semiprecious stones, except diamond, natural and synthetic, kilograms	2,919	7,192	Chile 3,928; Brazil 942; Mexico 771.
Pyrite	37	81	All from United States.
Salt	78	24	United States 21; West Germany 3.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	65,884	53,680	United States 35,676; Panama 12,077.
Caustic potash and sodic and potassic peroxides	457	69	United States 34; West Germany 22; France 10.
Soda ash	27,654	69,974	Mainly from United States.
Stone, sand and gravel:			
Dimension stone, crude and worked	7,890	6,195	Italy 4,404.
Gravel and crushed stone	255	93	France 70; West Germany 13; Norway 10.
Dolomite, chiefly refractory grade	33,696	16,013	Mainly from United States.
Quartz	133	95	Sweden 62; United States 28.
Sand	252	209	Mainly from United States.

COMMODITY REVIEW

METALS

Aluminum.—Aluminio del Caroní S.A. (ALCASA) remained Venezuela's sole producer of aluminum during 1977. ALCASA's total output of about 43,400 tons represented a 6.7% decline from that of 1976, at least partially caused by the effects of a protracted strike. Toward yearend, ALCASA completed its latest expansion program, which brought total plant capacity to 124,000 tons of aluminum per year.

At Ciudad Guayana, construction schedules were maintained on Venezuela's second aluminum smelter, projected to come onstream during the first half of 1978. The new smelter company, Indústria Venezolana de Aluminio, C.A. (VENALUM), is a joint venture between the Government and a Japanese consortium. Corp. Venezolana de Guayana (CVG) has an 80% interest in the new company, with the remainder divided between six Japanese companies: Showa Denko K.K. (7%), Kobe Steel, Ltd. (4%), Sumitomo Light Metal Industries, Ltd. (4%), Mitsubishi Metal Corp. (2%), Mitsubishi Chemical Industries Ltd. (2%), and Marubeni Trading Co. (1%). The new plant

Digitized by Google

will have four potlines of 180 cells each. Each line will have an annual capacity of 70,000 tons. The lines will come onstream at 6-month intervals until total plant capacity of 280,000 tons is reached in 1980. The output will include ingots, billets, and rolling ingots. The Japanese partners received priority rights to purchase 160,000 tons of aluminum annually, with the remaining 120,000 tons of plant output destined for Venezuelan or foreign markets. Some of the uncommitted 120,000 tons of plant output will probably go to Andean Pact countries; some may go to ALCASA; and eventually, about 50,000 tons will be purchased by Suramericana de Aleaciones Laminadas C.A. (SURAL), a joint venture between the U.S. firm Southwire Co. and private Venezuelan interests. SURAL is engaged in production of aluminum alloy rods for export to the United States, Puerto Rico, and Europe.

Venezuela has imported alumina from the United States, Guyana, Surinam, and Jamaica, but eventually both ALCASA and VENALUM will obtain alumina from a new bauxite reduction plant at Ciudad Guayana. The new facility, Interamericana de Alúmina C.A. (INTERALUMINA), is a joint venture between CVG and the Swiss firm Alusuisse. CVG controls 85% of the corporation, and Alusuisse and Billiton International Metals B.V. each own 7.5%. Plant construction is scheduled to begin in early 1978, with the first of two 500,000-ton-per-year alumina production lines expected to become operational in mid-1981. The second line is expected to come onstream in 1982, bringing plant capacity to an impressive 1 million tons of alumina per year. The plant will use gas from the Guayana region. It was originally planned to use imported bauxite, since Venezuela had no proven reserves of this ore when the project was conceived.

Shortly after finalizing the INTERALUMINA project agreement, it was announced that a major high-quality bauxite deposit had been discovered on a 700-meter-high plateau in south-central Venezuela in the Los Pijiguaos hills of Bolívar State. Located about midway between the towns of Caicara and Puerto Ayacucho, this discovery culminated an intensive search begun by CVG in 1974. The bauxite deposit has an average thickness of 11 meters, with very little overburden reported. Prospecting by drilling and gridding techniques over a 30-square-kilometer area confirmed a reserve estimate of 500 million tons of bauxite ore, with adjacent areas containing an additional reserve potential. Preliminary analyses indicated that the ore contains 50% to 52% aluminum oxide, primarily in the trihydrate form, with no more than than 1.5% monohydrate. Silica, chiefly in the form of fine-grained quartz, composes 6% to 10% of the ore, and iron oxide composes 8% to 12%. Very small quantities of titanium dioxide are also present, but virtually no clay is found except in the form of reactive silica. CVG expressed confidence that mine production and ore deliveries to INTERALUMINA would commence by 1982. CVG began construction on 35 kilometers of access road; however, transportation of the projected 2 million tons of ore per year to the bottom of the steep plateau and thence to Ciudad Guayana is expected to present the major problem to mining development.

Iron Ore.—The world steel recession continued to adversely affect the production and export of iron ore by Ferrominera Orinoco C.A., a wholly owned subsidiary of CVG. In 1977, total ore production amounted to only 14.4 million tons, compared with 26.4 million tons in 1974 and 18.7 million tons in 1976. This represents a decline of 23% from 1976 production and more than 45% from 1974 production. Exports also decreased 26% from the 1976 level of 16.1 million tons to 11.9 million tons in 1977. Gradual price increases have compensated for the reduced exports, and gross iron ore income has remained relatively stable for the last 4 years. Although iron ore accounted for only 2% of total Venezuelan exports, it remained second only to oil in importance. Ferrominera's iron ore shipments in 1977, by destination, are given in the following tabulation, in thousand tons:

Destination	Shipments
United States	6,394
Italy	1,805
Germany, Federal Republic of	975
Spain	631
Belgium-Luxembourg	509
Netherlands	307
Czechoslovakia	295
United Kingdom	284
Poland	141
Argentina	106

Iron and Steel.—Technical and labor difficulties at the CVG Siderúrgica del Orinoco C.A. (SIDOR) steel facility in Ciudad Guayana caused its output to drop to slightly more than 50% of capacity. SIDOR's plant expansion, begun 3 years ago, was reported to be about 30% complete. This ambitious project, scheduled for 1980 completion, will raise SIDOR's annual capacity from 1.25 million tons to 4.8 million tons. The successful conclusion of this expansion scheme will establish Venezuela as the only country in the world to have 4 million tons per year of integrated capacity on line in a single project.

Expansion and new projects in the steel and aluminum industries and their supporting infrastructures have made apparent the importance of increasing electrical generating capacity for the successful development of the Guayana region. A contract was awarded to a Brazilian-Venezuelan consortium for construction of the final stage of the Guri hydroelectric complex on the Caroní River, targeted for completion in 1983, with full capacity of 9,000 megawatts to be reached in 1988.

Late in 1977, Corp. de Desarrollo de la Región Zuliana (CORPOZULIA) awarded a management contract to British Steel Corp. for a new steel complex to be built near Maracaibo in the State of Zulia. The projected output of this new complex is 1.25 million tons by 1990. The year ended with financial arrangements for the steel project still uncertain, but in December, bids were invited for a 49% foreign equity participation. Several international groups were reported to have expressed interest, and a selection is anticipated in 1978.

Other.—The Government received participation offers from several international companies for development of the zinc-copper-lead-silver reserves at Bailadores in the State of Mérida. A final partnership selection was not completed by yearend.

MINERAL FUELS

Coal.—Coal production during 1977 totaled 113,700 tons, a 31% increase over that of 1976. The Naricual mines located about 25 kilometers south of Puerto La Cruz, under development by C.A. Minas de Naricual (CAMINA), contributed 46% of total production, and the Lobatera mines in the State of Táchira produced 51%.

The proximity of the Naricual mines to SIDOR's steelmaking facility in Ciudad Guayana was the major factor for the Government's 1974 decision to rehabilitate them. Labor, financial, and operational difficulties prevented CAMINA from meeting its 1977 production goal. SIDOR reportedly expressed some doubts as to the acceptability of the quality of CAMINA's test coking samples to meet its needs.

The Lobatera mines are under development by C.A. Minas de Carbón de Lobatera, with financial and administrative assistance provided by Corp. de Los Andes (CORPOANDES), Corp. Venezolana de Fomento (CVF), the Ministry of Energy and Mines, and a Polish consulting firm. Lobatera's reserves were estimated to be at least 60 million tons, with additional deposits in neighboring areas. The Government visualized the establishment of coke and cement plants to create increased demand for Lobatera coal, which it considers to be Venezuela's highest quality industrial coal. The relative inaccessibility of the region remained a major obstacle to rapid development.

CORPOZULIA, the regional development authority for Zulia State, planned to have its first open pit coal mine in the Guasare fields operational in 1978. The infrastructure network necessary to advance this uninhabited and remote area to its potential will require a massive effort. The coking quality of the coal also remained a major consideration. Preliminary analyses indicated that the coal contains a low percentage of ash but high amounts of volatile matter. Tests indicated that coal from lower seams, not scheduled for immediate development, may require less mixing with imported coal to produce the best metallurgical coke. Upper seams have been tested with fair results, using domestic-to-imported blends of 60:40 and 50:50. A 100-kilometer railroad is planned to connect the first Guasare coalfield mine at Paso el Diablo to the site of the future CORPOZULIA steel complex in Maracaibo. Initial production will be used for definitive analyses of the coking properties of the coal. In addition to providing coke for the new steel facility, CORPOZULIA believed it could provide 1 million tons of coal per year by 1984 to the thermal power station programed for the Maracaibo region.

Petroleum and Natural Gas.—PDVSA completed its second year controlling the nationalized petroleum industry. The 14 subsidiary companies originally established to operate under PDVSA's administration concentrated on expansion of development and exploration activities that had been neglected for some years prior to nationalization. In late 1977, Llanoven S.A., Palma-

Digitized by Google

ven S.A., and Roqueven S.A. were merged into the larger CVP. Further integration of the remaining PDVSA subsidiaries is expected to take place in 1978. PDVSA and its subsidiaries are subject to the same degree of Government regulation and taxation as were the former private companies. They are also limited for production purposes to the concession areas originally assigned to their private predecessors, but they are permitted to participate in exploration work outside these prescribed concession areas.

Despite some successful exploration and enhanced recovery programs, Venezuela's 1977 crude oil reserves were estimated at 18 billion barrels, a slight decrease from estimated 1976 reserves. Exploration expenditures were over $100 million during 1977, and $200 million has been budgeted for 1978. Light- and medium-gravity oils found in the deep Cretaceous wells drilled in the El Oriente and Lake Maracaibo areas continued to receive priority attention. Some Cretaceous wells exceeded 10,000 feet in total depth, and tests scheduled for 1978 are expected to reach 18,000 to 22,000 feet.

Preparatory work continued for the three-phase offshore exploration program, with the first drilling expected in 1978. The first exploratory phase includes the La Vela Embayment, the Golfo Triste, and an area off the Orinoco River delta. Phase 2 will include the area around Margarita Island and the northern part of the Gulf of Paria; final areas for phase 3 have not been selected. PDVSA hopes to expand reserves by at least 10 billion barrels of recoverable, light- to medium-gravity oil offshore, with perhaps an additional 26 billion to 64 billion barrels of probable reserves.

Exploration and development drilling continued to suffer from a shortage of drilling rigs and crews, although the total number of drilling and workover rigs increased slightly in 1977 and additional new rigs are expected during 1978. A total of 47 exploratory wells were drilled in 1977; 28 of these were successful, including 22 in the Cretaceous zone of the Lake Maracaibo and El Oriente regions.

Development activities for the heavy, mineral-laden oils of the Orinoco basin were transferred from the Ministry of Energy and Mines to PDVSA. The Instituto Tecnológico Venezolana de Petróleo (INTEVEP) conducts and evaluates improved recovery and related research on these heavy oils under the direction of PDVSA. It has been estimated that the Orinoco basin contains at least 700 billion barrels of oil, and deep drilling has encouraged speculation that there may be as much as 3 trillion barrels of oil in place with a current recovery factor of 10%. The high cost of producing, demetalizing, and upgrading these oils has remained a deterrent to extensive development, but several schemes to upgrade the oil and enhance recovery to perhaps 14% to 20% were under active study. During 1977, the three fields in the Orinoco basin produced about 150,000 barrels of oil per day.

Although the number of producing wells throughout Venezuela during 1977 dropped to 10,202 and production fell to 2.2 million barrels per day, the overall performance improved. Thermal recovery projects, workovers, and development drilling increased the number of flowing wells by 100. The number of pumping wells decreased to 8,111 from 9,876 in 1976. The average production per well was 219.4 barrels per day during 1977, compared with 193.3 barrels per day in 1976. Over $600 million was projected for capital investment in production activities during 1978, compared with $322 million in 1977 and $196 million in 1976. Light- and medium-gravity crude oil production dropped 7%, accounting for 70% of total output as opposed to 73% in 1976, while heavy crude oil production increased 9% over that of 1976. This trend toward increased production of heavy-gravity crude influenced PDVSA's development and exploratory planning.

[1]Less than 1/2 unit.

Source: Ministry of Energy and Mines. Petróleo y Otros Datos Estadísticos, 1977 (Caracas). October 1978.

Gross natural gas production increased slightly to about 3.6 billion cubic feet per day, of which 54% was reinjected, 38% was sold for domestic purposes, and 8% was flared.

Domestic consumption of petroleum products accounted for 11.5% of total crude oil production, but because of low domestic prices, only about 4.5% of total revenue is accountable to internal sales. An average 6% annual increase in domestic consumption of petroleum products, particularly gasoline, and the increase in heavy crude oil production partially influenced PDVSA's $1.5 billion program to upgrade its major refineries over the next 5 years. During 1977, over 970,000 barrels per day was refined by the 12 refinery complexes operated by four PDVSA subsidiaries. Total refinery capacity in 1977 was about 1,445,000 barrels per day. Actual production resulted in a 67% refinery utilization factor.

Marketing or offtake agreements were signed with multinational companies at the time of nationalization, an action that assured Venezuela market continuity for a major portion of its petroleum exports and provided the former concessionaire companies with assured supplies. These agreements accounted for about 75% of petroleum export sales in 1977. Some of these agreements have expired, but the most important ones were renewed for an additional 2-year period. Market diversification, a recognized national goal, was partially realized when CVP, Lagoven, and Maraven were authorized to sell on the international market. Their share of sales amounted to 25% of total petroleum exports during 1977 and was expected to gradually increase in the future.

The United States remained the major purchaser of Venezuelan petroleum exports. Western Hemisphere markets received almost 92% (by volume) of these exports, as follows: The United States 36%, Caribbean countries 33%, Canada 13%, and Central and South American countries 10%. Two-thirds of the petroleum exports consisted of crude oil; the remainder were refinery products, mainly fuel oils.

PDVSA determines the price of crude oil in accordance with Government policy and at levels established by the Organization of Petroleum Exporting Countries (OPEC). Having the widest range of crude oil types of any OPEC member, Venezuela has a correspondingly wide range of export prices. Refinery product prices are not subject to OPEC price levels and are adjusted by PDVSA on a quarterly basis, with the exception of the fuel oil price, which is adjusted monthly.

The Mineral Industry of Yugoslavia

By Roman V. Sondermayer[1]

Yugoslavia maintained its position as one of the leading producers of nonferrous metals in Europe during 1977. The more prominent minerals, with production in 1977 expressed as a percentage of world output, were as follows: Magnesite and lead each 4%, antimony 3%, bauxite and zinc each 2%, and copper 1%. Production of other minerals was of only domestic significance. Lignite remained the principal fuel produced in the country. Imports of liquid fuels and high-rank coals were required to meet the growing energy demand. Economic difficulties in the country and abroad affected financial results of most mining and mineral-processing enterprises, and some of them faced serious problems in meeting their loan obligations.

The mineral industry, including processing and construction materials, contributed about 11% of the gross social product[2] and employed approximately 6% of the labor force, or 320,400 persons.

The general economic condition of the country was characterized by inflation (14%), unemployment (13%), and economic growth (7%). The mineral industry had financial problems, but expansion of processing facilities for some minerals (such as bauxite) and expansion of mining facilities for others (lead, zinc, and copper) continued.

In certain parts of the country, geological exploration was far behind contracts and plans. In Serbia, only about 48% of the exploration contracts to be completed in 1977 were actually completed.

The mineral industry had a mixed year, but there were a number of important events related to minerals. The socialized economy, with loans from the Government-owned banks, made continued investments possible in an unfavorable economic climate. The principal events included beginning of construction of an aluminum smelter near Mostar, Bosna i Hercegovina (or Bosnia and Hercegovina); continuation of construction of alumina plants near Zvornik, Bosnia and Hercegovina, and Obrovac, Hrvatska (or Croatia); a decision to develop the Veliki Krivelj copper deposit located in the general area of Bor, Srbija (or Serbia); closure of the mercury mine and smelter at Idria, Slovenija (or Slovenia); development of a nickel mine and construction of a ferronickel smelter near Kavadarci, Makedonija (or Macedonia); expansion of zinc electrolytic plants at Sabac and Kosovska Mitrovica, both in Serbia; beginning of development of a new lignite mine at Tamnava, Serbia; beginning of construction of a gas pipeline system through Slovenia; and completion of expansion of the petroleum refinery at Rijeka, Croatia.

PRODUCTION

The mineral industry was State owned; however, investment of foreign capital in Yugoslavia's mineral industry was allowed, providing that Yugoslavia retained ownership of the deposit and controlling interest in the venture. Nevertheless, except for one recent investment in the petrochemical field, no foreign investments have as yet been made in the mineral industry. The size of enterprises ranges from large integrated operations, mostly in production of metals, to small mines, mostly in production of

Digitized by Google

nonmetals. The following tabulation lists the major enterprises and their principal facilities operating in Yugoslavia during 1977, with their share of national totals.

Commodity	Major companies[1]	Principal facilities	Percent of domestic output
Aluminum	Tvornica Lakih Metala Boris Kidric	Smelter at Sibenik (Croatia)	55
Antimony	Rudarsko Topionicarski Basen Zajaca	Smelter at Zajaca; mine at Kopaonik Mountain (Serbia).	100
Bauxite	Energoinvest	Mines at Vlasenica (Bosnia and Hercegovina).	55
Coal, brown	Titovi Rudnici Kreka-Banovici	Mines at Kreka, Banovici, Breza, Kakanj (Bosnia and Hercegovina).	35
Copper metal	Rudarsko Topionicarski Basen Bor	Mines at Bor and Majdanpek; smelter at Bor (Serbia).	100
Lead, smelter	Rudarsko-Metalurski Kombinat Trepca.	Mine at Stari Trg; smelter at Zvecan (Serbia).	75
Lignite	Rudarsko Energetsko Industrijski Kombinat Kolubara.	Mines at Kolubara and Tamnava (Serbia)	30
Petroleum	Industrija Nafte	Oilfields at Benicanci and Struzec; refineries at Rijeka and Sisak.	72
Steel, crude	Rudarsko-Metalurski Kombinat Zenica	Integrated iron and steel works at Zenica (Bosnia and Hercegovina).	37
Zinc, smelter	Zletovo, Topilnica za Cink i Olovo	Imperial smelter at Titov Veles (Macedonia).	36

eEstimate. pPreliminary. rRevised. NA Not available.

[1]In addition to the commodities listed, germanium, platinum, palladium, bentonite, kaolin, common clay, and diatomite are also produced, and tellurium may be recovered as a copper-refining byproduct, but available information is inadequate to make reliable estimates of output levels.

[2]As reported in official Yugoslav production statistics; sum of actual reported gross weight for each class of fertilizer.

[3]Excludes refinery gas (11.6 billion cubic feet in 1975, 12.6 billion cubic feet in 1976, and an unreported quantity in 1977) as well as other materials produced by and used in the refineries as fuel.

[4]Includes a combined estimate of 13,886,000 barrels for entries given as NA.

TRADE

During 1977, Yugoslavia remained a net importer of minerals. Imports of minerals, valued at about $2.3 billion,[3] accounted for 30% of total imports. Fuels, mostly crude oil and bituminous coal, made up 48% of the country's mineral imports. Exports of minerals, valued at $800 million, made up about 17% of total exports.

Yugoslavia had a mineral trade surplus of about $122.5 million with the United States in 1976. Approximately 19% of total Yugoslav exports of minerals went to the United States, making up about 0.12% of total imports of the United States. Approximately 1% of total Yugoslav imports of minerals originated in the United States; this was about 0.2% of total exports of the United States.

Table 4 shows details of mineral trade between the United States and Yugoslavia in 1976.

Table 2.—Yugoslavia: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Bauxite and concentrate thousand tons	1,283	1,024	U.S.S.R. 660; Czechoslovakia 149; Romania 139.
Alumina	73,845	91,664	U.S.S.R. 61,382; Czechoslovakia 19,917.
Metal including alloys:			
Scrap	6,741	7,132	Italy 4,962; West Germany 1,957.
Unwrought	71,964	82,775	East Germany 44,213; United States 14,649.
Semimanufactures	51,695	61,578	Czechoslovakia 21,468; United States 10,115.
Antimony, regulus	1,306	775	Bulgaria 450; U.S.S.R. 325.
Bismuth metal including alloys, all forms	33	19	United States 18.
Cadmium metal including alloys, all forms	65	153	United States 133.
Chromium:			
Chromite	3,280	303	All to Czechoslovakia.
Oxide and hydroxide	193	184	West Germany 170.

Fertilizer materials, manufactured:			
Nitrogenous	5,521	38,466	West Germany 20,312; Turkey 10,000; Netherlands 5,163.
Phosphatic	16,744	134,876	Hungary 107,075; East Germany 27,800.
Other, including mixed	157,219	159,247	Italy 58,781; Hungary 35,777; West Germany 26,632; Ghana 14,820.
Gypsum and plaster	18	12	Gabon 5; U.S.S.R. 4; Sudan 3.
Lime	743	3,862	United Kingdom 2,156; Hungary 1,646.
Magnesite	69,599	34,715	Poland 12,831; U.S.S.R. 10,070; Italy 8,584.
Pyrite, gross weight	171,920	209,015	Romania 196,153.
Salt and brine	51	1	All to Austria.
Sodium and potassium compounds, n.e.s	16,071	1,081	U.S.S.R. 1,020.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked	61,400	50,853	Italy 30,079; Czechoslovakia 11,850.
Worked	10,450	11,202	West Germany 7,875.
Dolomite, chiefly refractory grade	196	356	France 291; Greece 50.
Gravel and crushed rock	1,902	72,000	Mainly to Gabon.
Limestone (except dimension)	146	986	Do.
Quartz and quartzite	21,049	11,647	All to West Germany.
Sand, excluding metal bearing	2,198	1,444	Albania 1,259; Greece 177.
Sulfur:			
Sulfur dioxide	5	--	
Sulfuric acid	19,819	5,104	Mainly to Romania.
Talc, steatite, soapstone, pyrophyllite	22	11	Czechoslovakia 10; West Germany 1.
Other:			
Crude:			
Calcite	NA	145	Pakistan 124; West Germany 21.
Unspecified	1,071	1,325	Mainly to Greece.
Slag, dross, and similar waste, not metal bearing	5,044	1,375	Austria 799; Italy 575.
MINERAL FUELS AND RELATED MATERIALS			
Carbon black	503	223	All to West Germany.
Coal and briquets:			
Anthracite and bituminous coal	10,149	146	All to Austria.
Lignite and lignite briquets	339,068	355,163	Austria 212,623; Italy 42,525.
Hydrogen, helium, rare gases ____ kilograms	100	27,920	Italy 17,920; Iran 10,000.
Peat, including peat briquets and litter	22	NA	
Petroleum:			
Partly refined ___ thousand 42-gallon barrels	28	NA	
Refinery products:			
Gasoline ____ do	44	512	Netherlands 437.
Kerosine and jet fuel ____ do	288	253	United Kingdom 55; Austria 40.
Distillate fuel oil ____ do	r299	923	West Germany 379; Italy 210; Austria 191.
Residual fuel oil ____ do	396	200	Austria 31; Brazil 30; Liberia 30.
Lubricants ____ do	1	5	Bulgaria 1.
Other:			
Liquefied petroleum gas ____ do	104	(1)	NA
White spirits ____ do	4	35	All to Austria.
Mineral jelly and wax ____ do	NA	42	Italy 24; West Germany 10.
Petroleum coke ____ do	5	62	All to West Germany.
Unspecified ____ do	1	--	
Total ____ do	1,142	2,032	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	820	6,422	Belgium-Luxembourg 2,871; Netherlands 1,931; Italy 902.

Commodity	1975	1976	Principal sources, 1976
METALS —Continued			
Platinum-group metals including alloys, all forms:			
Platinum ---------- troy ounces	1,511	4,372	U.S.S.R. 1,736; West Germany 1,254; United Kingdom 900.
Palladium ---------- do	30,896	53,306	Mainly from U.S.S.R.
Rhodium ---------- do	32	--	
Other ---------- do	1,961	--	
Silver metal including alloys thousand troy ounces	1,789	1,318	West Germany 418; Austria 322; Switzerland 289; Poland 161.
Tellurium, elemental ---------- kilograms	316	300	All from West Germany.
Tin:			
Oxides ----------	6	4	Do.
Metal including alloys:			
Unwrought ----------	1,038	1,365	Malaysia 687; People's Republic of China 571.
Semimanufactures ----------	20	17	West Germany 11.
Titanium:			
Ore and concentrate ----------	52,069	45,093	All from Australia.
Oxides ----------	2,932	2,419	Hungary 695; West Germany 563; France 398; Czechoslovakia 340; United Kingdom 286.
Metal including alloys, all forms ----------	113	23	United States 15; West Germany 2; U.S.S.R. 2.
Tungsten metal including alloys, all forms ----------	9	11	Austria 3; Netherlands 2; United Kingdom 2; France 1.
Zinc:			
Ore and concentrate ----------	58,046	67,891	North Korea 25,207; Peru 14,241; Canada 9,365; Czechoslovakia 8,821.
Oxides ----------	166	138	West Germany 130; United Kingdom 2.
Metal including alloys:			
Unwrought ----------	18,772	12,974	Zambia 9,101; Bulgaria 2,390; U.S.S.R. 1,456.
Semimanufactures ----------	298	187	West Germany 138; Italy 49.
Zirconium metal including alloys, all forms ----------	4	(1)	NA.
Other:			
Ores and concentrates:			
Of vanadium, tantalum, zirconium ----------	363	752	Australia 244; Netherlands 220; West Germany 182.
Of base metals, n.e.s ----------	3,276	--	
Ash and residue containing nonferrous metals --	55	220	Mainly from Switzerland.
Oxides, hydroxides, peroxides of metals, n.e.s ---	707	797	West Germany 571.
Metals including alloys, all forms:			
Metalloids ----------	186	142	West Germany 70; U.S.S.R. 55.
Alkali, alkaline earth, rare-earth metals ---	291	191	France 108; Italy 44; West Germany 30.
Pyrophoric alloys ----------	10	8	Austria 2; West Germany 1; Italy 1.
Base metals including alloys, all forms, n.e.s.	35	29	United Kingdom 23; Belgium-Luxembourg 5.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc ----------	229	236	Denmark 138; Italy 46; Netherlands 25.
Grinding and polishing wheels and stones -----	1,634	1,100	Austria 606; West Germany 188; Italy 124.
Asbestos ----------	52,138	42,675	U.S.S.R. 30,405; Botswana 6,137; Canada 4,845.
Barite and witherite ----------	1,393	760	West Germany 580; Czechoslovakia 180.
Boron materials:			
Crude natural borates ----------	20,057	14,465	United States 13,465.
Oxides and acids ----------	1,519	1,002	U.S.S.R. 811; France 152.
Bromine ----------	6	2	All from Austria.
Cement:			
Portland ---------- thousand tons	r340	255	Hungary 205.
Other ---------- do	139	325	Italy 92; Austria 26.
Chalk ----------	2,388	2,230	France 1,518; Austria 528.
Clays and clay products (including all refractory brick):			
Crude:			
Bentonite ----------	424	343	Italy 250; West Germany 40; United Kingdom 37.
Fire clay ----------	18,212	22,416	Czechoslovakia 19,190.
Fuller's earth, Dinas earth, chamotte -----	2,830	5,103	Poland 2,026; West Germany 1,767; Czechoslovakia 945.
Kaolin ----------	59,528	60,389	Czechoslovakia 34,692; West Germany 9,457; Greece 7,084.
Other ----------	4,496	4,682	Czechoslovakia 3,690.
Products:			
Refractory (including nonclay brick) -----	27,960	55,989	U.S.S.R. 20,320; West Germany 14,195; Austria 7,213.
Nonrefractory ----------	68,260	32,776	Italy 10,032; Albania 6,156; Romania 5,332; Czechoslovakia 4,682.
Cryolite and chiolite ----------	360	448	All from Denmark.
Diamond:			
Gem, not set or strung ---------- carats	15,000	15,000	West Germany 10,000.
Industrial ---------- do	65,000	535,000	United Kingdom 295,000; France 100,000; Belgium-Luxembourg 70,000.
Powder ---------- do	70,000	345,000	U.S.S.R. 185,000; United Kingdom 70,000; Switzerland 65,000.

Commodity	1975	1976	Principal sources, 1976
NONMETALS —Continued			
Diatomite and other infusorial earth	148	145	Austria 65; Hungary 60.
Feldspar	1,070	629	France 600.
Fertilizer materials:			
Crude, phosphatic thousand tons	846	880	Morocco 692; Togo 126.
Manufactured:			
Nitrogenous	157,585	129,708	Hungary 40,528; Czechoslovakia 34,598; U.S.S.R. 33,874; Poland 16,018.
Phosphatic	43,927	39,881	Tunisia 28,940; Morocco 10,000.
Potassic	247,385	333,017	East Germany 208,602; U.S.S.R. 114,979.
Other, including mixed	14,419	20,064	Poland 14,624; Romania 4,999.
Ammonia	39,276	64,284	Hungary 45,214; East Germany 11,557; U.S.S.R. 7,507.
Fluorspar	6,638	5,617	East Germany 2,937; West Germany 1,826; France 601.
Graphite, natural	1,569	1,853	Austria 652; U.S.S.R. 472; Czechoslovakia 372; East Germany 200.
Gypsum and plasters	7,712	5,179	Mainly from Poland.
Iodine	50	38	Poland 23; Japan 8; United States 7.
Lime	476	--	
Magnesite	12,221	17,788	Turkey 9,695; North Korea 6,986.
Mica:			
Crude, including splittings and waste	396	314	Norway 234; West Germany 40.
Worked, including agglomerated splittings	323	101	Czechoslovakia 24; India 19; Austria 17; West Germany 16; Belgium-Luxembourg 14.
Pigments, mineral:			
Natural, crude	7	--	
Iron oxides, processed	2,932	2,103	Hungary 787; West Germany 691; Czechoslovakia 312; Spain 255.
Precious and semiprecious stones, except diamond:			
Natural kilograms	29	17	West Germany 13; India 3.
Manufactured do	410	244	Japan 117; Switzerland 61; West Germany 60.
Pyrite, gross weight	101,310	11,990	Mainly from U.S.S.R.
Quartz, piezoelectric kilograms	564	2,019	Mainly from United States.
Salt and brine	113,247	141,760	Romania 105,153; Tunisia 30,000.
Sodium and potassium compounds, n.e.s.:			
Caustic soda	115,922	109,698	Italy 48,919; France 30,703; West Germany 21,369.
Caustic potash and sodic and potassic peroxides	2,006	1,134	Czechoslovakia 386; East Germany 305; West Germany 273.
Stone, sand and gravel:			
Dimension stone:			
Crude and partly worked:			
Calcareous	4,208	6,993	Greece 6,051; Italy 917.
Slate	326	207	West Germany 180; France 20.
Other	2,480	1,965	Italy 1,773.
Worked:			
Slate	37	200	All from Italy.
Other	25	234	Mainly from Italy.
Dolomite, chiefly refractory grade	4,409	1,791	Italy 1,176; Austria 545.
Gravel and crushed rock	143,371	148,129	Mainly from Hungary.
Limestone (except dimension)	40,202	35,375	All from Hungary.
Quartz and quartzite	16,031	108,219	East Germany 19,353; Hungary 17,112.
Sulfur:			
Elemental, all forms	1,832	204	West Germany 130; Italy 74.
Sulfur dioxide	80	441	Italy 250; West Germany 191.
Sulfuric acid	155,110	52,590	Hungary 24,732; Bulgaria 8,776; East Germany 6,012.
Talc, steatite, soapstone, pyrophyllite	2,488	2,461	France 978; Italy 702; West Germany 330.
Other:			
Crude	10,947	9,716	Hungary 8,094; Austria 1,295.
Slag, dross, and similar waste, not metal bearing	298,762	200,112	Mainly from Italy.
Oxides and hydroxides of magnesium, strontium, barium	506	1,473	Norway 1,000; West Germany 289.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	3,686	5,414	Romania 4,579; Albania 794.
Carbon black and gas carbon	7,976	6,612	Italy 4,820; West Germany 992.
Coal and briquets:			
Anthracite and bituminous coal thousand tons	2,176	2,688	U.S.S.R. 1,750; Czechoslovakia 658.
Briquets of anthracite and bituminous coal	NA	486	All from Poland.
Lignite and lignite briquets	155,855	127,519	U.S.S.R. 54,164; East Germany 37,768; Greece 13,053.
Coke and semicoke thousand tons	499	170	Poland 100; Italy 31; United Kingdom 18.
Hydrogen, helium, rare gases kilograms	24,147	12,498	Italy 8,797; West Germany 1,703; Austria 1,300.
Peat, including peat briquets and litter	8,114	5,637	U.S.S.R. 3,640; Hungary 979; Poland 908.
Petroleum:			
Crude thousand 42-gallon barrels	51,779	58,058	Iraq 33,556; U.S.S.R. 21,343.
Partly refined do	126	140	Italy 50; Hungary 39; West Germany 18; Czechoslovakia 17.

COMMODITY REVIEW

METALS

Aluminum.—The beginning of construction of an aluminum smelter at Bacevici near Mostar, Bosnia and Hercegovina; continuation of construction of alumina plants at Birac, near Zvornik, Bosnia and Hercegovina, and near Obrovac, Croatia; and credit from the German Democratic Republic for expansion of an aluminum plant near Sibenik, Croatia, were the most important events related to the aluminum industry of Yugoslavia during 1977.

Construction of the new 92,000-ton-per-year aluminum electrolytic plant at Bacevici, to cost 4 billion dinars (Din), started during July 1977. The new plant is located near the existing 280,000-ton-per-year alumina plant. Foreign equipment suppliers will furnish 11% of the equipment. The State-owned concern Energoinvest, the major investor, will operate the plant after completion in 1980.[4] The Bacevici plant, also known as the Mostar plant, has a long history. The decision to build the plant was made in 1972. The beginning of construction was marked with a ceremony in 1973. From 1973 until fall 1977, construction was delayed by financial problems. In 1977, Péchiney Ugine Kuhlmann (PUK) agreed to provide know-how and financial support. With PUK's backing, actual plant construction started in fall 1977, with completion scheduled within 30 months.

Construction continued on a 600,000-ton-per-year alumina plant at Birac, also known as the Zvornik plant. The U.S.S.R. was financing construction, and credit was to be repaid within 10 years with deliveries of all alumina produced at Birac. In addition, construction continued on the alumina plant near Obrovac, Croatia. The annual capacity was reported to be 300,000 tons of alumina. Startup for both alumina plants was scheduled for mid-1978.

The Government of the German Democratic Republic agreed to finance construction for 35,000 tons of additional aluminum capacity at the Sibenik aluminum plant. Completion of the expansion was scheduled for 1981, when the Sibenik facility should have a capacity of 110,000 tons of aluminum per year. The Sibenik aluminum plant remained the largest producer of aluminum metal in the country, and based on preliminary reports, produced a record high of 82,000 tons of aluminum metal during 1977. Despite excellent production results, the enterprise sustained a financial loss of about Din150 million, resulting from domestic sales at fixed prices and from artificial exchange rates for foreign currencies earned from exports.

Yugoslavia was a net exporter of bauxite and aluminum metal. Apparent consumption of aluminum metal was about 92,000 tons in 1976, the latest year for which complete data are available.

Antimony.—After about 12 months of trial production, the Rajiceva Gora antimony mine and mill on Kopaonik Mountain in Serbia, operated by Rudarsko Topionicarski Basen Zajaca (RTB Zajaca), started regular production. Output should reach 300,000 tons of ore by 1979. Reserves of antimony ore at Rajiceva Gora were estimated at between 10 million and 15 million tons. The grade of the ore was not made public.

Exploration in the general area of Rujevac, Serbia, led to the discovery of "important" reserves of lead, zinc, and antimony ores. Development of a new mine was to start during 1979, provided that financing was assured. In the vicinity of Kriva Palanka, Serbia, exploration for bentonite by geologists of Bentomak, a local producer of bentonite, led to the discovery of antimony ore. During exploration work, about 13,000 tons of ore was produced; it was considered that the deposit could justify construction of a mine and mill.

A decision to build Yugoslavia's first antimony oxide plant, initially of 400-ton-per-year capacity, was made by RTB Zajaca. The location of the facility was not announced, but it is believed that it will be Zajaca, where the only Yugoslav antimony smelter was in operation.

Copper.—Although economic results were below expectations, 1977 was an eventful year for the copper industry.

Development was completed of ore body X at the mine at Bor, Serbia, operated by Rudarsko Topionicarski Basen Bor (RTB Bor), the only mine and smelter producer of copper in Yugoslavia, and trial production started in 1977. Reserves of 8 million tons of ore with an average metal content of 1.1% copper were confirmed. In addition, RTB Bor decided to start development of a new opencast copper mine at Veliki Krivelj, and the beginning of actual development was scheduled for 1978. The first phase of development was scheduled for completion in 1980, when the Veliki Krivelj mine should

Digitized by Google

produce 25,000 tons of copper in concentrate. The average ore grade was only 0.42% copper, but according to the management, it is "easy" to concentrate.[5]

For the Veliki Krivelj operation, RTB Bor was planning to purchase 12 trucks of 120- to 150-ton capacity and two 11-cubic-meter shovels and to build a flotation plant with an annual capacity of 5.5 million tons of ore.[6] It was expected that when development is completed after 1980, the Veliki Krivelj operation would have an annual capacity of 64,000 tons of copper in concentrate, including production from a small rich deposit at nearby Cerovo.

At Majdanpek, Serbia, also in the general area of Bor, work continued on construction of another segment of the mill. When completed early in 1978, the mill will have a capacity of over 14 million tons per year of ore. During 1977, the opencast mine at Majdanpek produced about 13.3 million tons of ore, from which the flotation plant produced about 258,000 tons of concentrates containing about 64,500 tons of copper. Approximately 33 million tons of overburden was removed. At yearend, the Majdanpek mine employed about 3,020 persons.

At Bucim, Macedonia, near Radovis, development of a mine and construction of a mill continued by a Macedonian State enterprise, Bucim Rudnik za Bakar u Osnivanju. Recent exploration confirmed 100 million tons of ore. Reportedly, the ore grade is such that it could sustain an output of 22,000 tons of copper per year for 28 years. First concentrates from Bucim should be shipped to the Bor smelter during 1978.

Iron Ore.—Exploration and production of iron ore remained concentrated in areas already known as producers of iron ore in Bosnia and parts of western Macedonia. Difficulties were encountered in financing exploration for iron ore and development of new mining capacities of over 9 million tons of ore per year to become operational in 1980.

Iron mines in Bosnia, of which the Vares-Ljubija mines operated by Rudarsko-Metalurski Kombinat Zenica (RMK Zenica) are the most important, remained the largest producers of iron ore in the country, accounting for about 82% of total output.

Domestic production of iron ore supplied slightly under 89% of the country's demand, and Yugoslavia was a net importer of iron ore. Brazil and the U.S.S.R. were the principal suppliers. Apparent consumption of iron ore was about 4.7 million tons in 1976, the latest year for which complete data are available.

Iron and Steel.—The RMK Zenica plant at Zenica, Bosnia and Hercegovina, the largest integrated iron and steel plant in the country, continued to expand its facilities. After trial production, which started in August 1976, a new Soviet-built converter steel plant went into regular production during summer 1977 at a lower output than the capacity of 1.3 million tons of steel per year. The Zenica plant's new total annual capacity of 2.3 million tons of steel can only be reached after completion of the fourth blast furnace designed to produce 1 million tons of pig iron per year. The blast furnace was scheduled for completion in 1978 or 1979.

At the Smederevo iron and steel plant, a hot-rolling installation was completed with a capacity of 220,000 tons of hot-rolled strip, whereupon the first phase of construction, which lasted 13 years, was completed. A second expansion project was started in 1977, which is to increase output to 1.6 million tons of steel.

Lead and Zinc.—Exploration for new lead and zinc deposits and expansion of several mines, the lead refinery at Zvecan, Serbia, and the zinc electrolytic plants at Sabac and Kosovska Mitrovica, both in Serbia, were the principal activities in the lead and zinc industry during 1977. Lead and zinc smelter capacities remained greatly in excess of mine production, and imports of zinc concentrates were an important part of the smelter supply.

Montenegro, particularly the northern part, was the site of active exploration for lead and zinc and other minerals, although no major discoveries in that area were made public during 1977. The recently completed railroad line from Beograd to the port of Bar on the Adriatic Sea, passing through northern Montenegro, encouraged exploration in that area.

At the Stari Trg mine, operated by Rudarsko-Metalurski Kombinat Trepca (RMK Trepca), development of 10 and 11 Horizon and construction of a new mill at Tunnel 1 continued during 1977. When completed sometime around 1980, the Stari Trg mine should produce and process 1 million tons of ore per year, an increase of about 40% over the 1977 output.

At the Rudnik mine in Serbia, expansion of capacity started. When completed in 1978, output of ore should increase to 230,000 tons, about 60,000 tons more than present production. Costs of expansion were reported at Din100 million (about $5 million).

Digitized by Google

Preliminary work for expansion of the zinc electrolytic plants at Sabac, operated by Hemiska Industrija Zorka, and Kosovska Mitrovica, operated by RMK Trepca, was underway. The new capacity at Sabac was planned at 48,000 tons per year and at Kosovska Mitrovica, 65,000 to 70,000 tons per year.

RMK Trepca remained the largest mine and smelter producer of lead and zinc in the country. Among other facilities, RMK Trepca operated the country's largest lead and zinc mine at Stari Trg (also known as the Trepca mine), the largest lead smelter and refinery at Zvecan (also known as the Trepca smelter), and the largest zinc electrolytic plant at Kosovska Mitrovica (also known as the Trepca zinc electrolytic plant).

During 1977, about 18 lead-zinc mines and 14 flotation plants were operational. Two lead smelters, one at Zvecan, Serbia, and the other at Mezica, Slovenia, and one lead refinery at Zvecan produced lead. In addition, one Imperial smelting plant at Titov Veles, Macedonia, produced lead and zinc, and two zinc electrolytic plants, one at Sabac, Serbia, and the other near Kosovska Mitrovica, Serbia, were in production.

Mercury.—The mine and smelter at Idria, Slovenia, the only mercury producer in Yugoslavia, was closed at the beginning of 1977 because of low mercury prices. The mine and smelter retained a maintenance crew to keep facilities operational in order to restart the operation whenever the price for mercury on the world market assures a profitable operation.

Nickel.—Development of a mine and construction of a ferronickel smelter continued during 1977 at Rzanovo, near Kavadarci, Macedonia. Reserves in the area are put at about 30 million tons of lateritic ore containing 0.9% nickel. Production should start in 1978 or 1979. Mine output reportedly will be 2 million tons per year and the smelter should reach an annual output of 64,000 tons of ferronickel containing about 16,000 tons of nickel. The main equipment for this nickel ore-pelletizing plant is to be supplied by Polysius Corp. of Atlanta, Ga. The pelletizing plant will consist of five pelletizing discs with diameters of 7.6 meters and two Lepol kiln lines with a traveling grate system. Each kiln is 6.0 meters in diameter and 75 meters long. The Lepol grates are 4.0 meters wide and 42 meters long. Each line should produce 2,400 tons per day of prereduced pellets with a metal content averaging about 5.5%. The combination of rotary kiln and electric furnace lowers the production costs because the efficiency of the process is improved by using hot prereduced pellets. This plant uses, for the first time, a combined pelletizing and prereduction process for nickel ore.[7]

The major bulk materials-handling equipment contract went to Robins Engineers & Constructors. The contract was for the design, supply, and commissioning of a sloping and luffing boom stacker and two portal scraper reclaimers. The stacker was designed to build two parallel storage piles at a rate of 715 tons per hour. Each portal scraper will reclaim the layered ore at a rate of 375 tons per hour and mix the stored ore for delivery to the smelter. To prevent pollution of the area near the nickel smelter, Environmental Elements Corp. (Enelco) of the United States supplied a complete wet-scrubbing system for each of two ferronickel electric furnaces. The scrubbing systems incorporate adjustable-throat Venturi scrubbers, four stainless steel fans, four quench towers, and interconnecting refractory-lined and stainless steel ducts.

Other.—Yugoslavia also produced bismuth, cadmium, chromite, germanium, gold, manganese, platinum, palladium, selenium, and silver in 1977. Bismuth was a byproduct of lead and zinc at RMK Trepca's smelter in Serbia, and cadmium was a byproduct of RMK Trepca's smelter, Hemiska Industrija Zorka's zinc electrolytic plant at Sabac, Serbia, and the lead-zinc smelter at Titov Veles, Macedonia. The Bor complex in Serbia yielded gold, germanium, platinum, palladium, and selenium as byproducts of copper. Manganese was produced in Bosnia. RMK Trepca's operations were the main source of silver, a byproduct of lead and zinc processing.

NONMETALS

Bentonite.—The local authorities at Vlasotince, Serbia, and the Foundry and Metallurgical Combine of Beograd signed an agreement for development of bentonite deposits near the villages of Ladovica, Prisjan, and Zavidince. A plant for processing bentonite will be built at Vlasotince. Most of the bentonite produced is to be used by the Combine.

Cement.—During 1977, one new cement plant with a capacity of 1.2 million tons came onstream at Beocin near Novi Sad, Serbia. Total investment at Beocin reached an equivalent of $105 million. Construction also continued on a 600,000-ton-per-year cement plant at Kakanj, Bosnia and Herce-

Digitized by Google

govina, and on an addition with a capacity of 600,000 tons per year at the existing plant at General Jankovic in Macedonia. Both plants should start normal production during 1979.

Output of cement ranked first in value of nonmetals produced in Yugoslavia and reached an alltime high of 8 million tons in 1977, but domestic production was, nevertheless, below requirements and imports were necessary. Twenty cement plants were in operation, the largest of which was a 1,750,000-ton-per-year plant at Beocin, operated by Beocinska Fabrika Cementa.

Lime.—During 1977, construction continued on a 100,000-ton-per-year lime plant at Drnis, Croatia, and all preliminary work was completed for construction of a 125,000-ton-per-year hydrated lime plant at Slavonski Brod, Croatia. In addition, production of lime for metallurgical use started at the Veljko Dugosevic lime plant at Kucevo, Serbia. Reportedly, all output will be used by the iron and steel works at Smederevo, Serbia.

Magnesite.—After long debate, local authorities at Bar, Montenegro, a port on the Adriatic Sea, granted conditional permission for construction of an installation to produce sinter magnesite from seawater and dolomite. Strict protection of the environment was reported as the basic condition for making the project a reality. How Magnohrom, the investor for the project, will react to this condition was not known at yearend.

Salt.—The Bajo Sekulic marine salt plant at Ulcinj, Montenegro, completed planning for construction of a salt refinery with a capacity of 240 tons per day. Equipment was purchased in Italy. The refinery should start operation in 1979.

Silicon.—A new quartzite mine operated by a local enterprise came onstream in the village of Donja Bela Reka near Bor, Serbia. Reserves were set at 50 million tons of quartzite with a purity of 99.28%.

MINERAL FUELS

During 1977, domestic low-rank coals remained the principal source of energy in the country, and Yugoslavia was dependent on imports of high-rank coals, coke, and crude oil. Table 5 shows supply and apparent consumption of energy-producing materials for 1975 and 1976, in million tons of standard coal equivalent.

A decision to build, jointly with Romania, another hydroelectric plant at Djerdap on the Dunav (or Danube) River, 80 kilometers below the existing dam at Iron Gates, will assure a regular supply of electric power to the copper mines and smelter and electrolytic plants in eastern Serbia. The powerplant will consist of 16 hydroturbines with an installed capacity of 432 megawatts. The planned completion date is 1985.

Coal.—In the Kolubara basin, approximately 60 kilometers southwest of Beograd, the enterprise Rudarsko Energetsko Industrijski Kombinat Kolubara (REK Kolubara) started development of the Tamnava opencast mine in Serbia. Plans called for an output of 18 million to 20 million tons of lignite to be reached sometime between 1980 and 1985. The lignite is low grade; an average analysis showed a moisture content of around 50%, ash 10%, and sulfur about 0.5%, with a calorific value of between 1,800 and 2,200 kilocalories per kilogram. Most of the production will be used by several powerplants situated near Obrenovac. Long-range targets for the Tamnava project include operation of five lignite-fired powerplants with a total capacity of 6,700 megawatts-electric, based on an output of 40 million tons of lignite.

In the Kosovo lignite basin near Pristina, Serbia, Rudarsko Energetsko Hemijski Kombinat Kosovo (REH Kosovo) started work on construction of two power-generating units with capacities of 339 megawatts each near Obilic. The Belacevac opencast mine in the Kosovo basin, located nearby, will supply the necessary lignite to meet future demand. Work was started on expanding the Belacevac mining field production from 5.5 million tons to 10 million tons and completing mine expansion and construction of powerplants.

Long-range plans announced late in 1977 indicated the development of the Sisovac opencast mine, also in the Kosovo basin, with an annual capacity of 18 million tons of lignite. The Sisovac mine was planned to supply lignite to three new electric powerplants with a capacity of 600 megawatts each planned for the region after 1980. When all planned powerplants are completed, the area around Pristina, Serbia, will have in operation nine lignite-fired power-generating units, with an aggregate capacity of 3,200 megawatts. Concern was expressed about the environmental impact on the Kosovo region of burning such large quantities of lignite and handling cinder and ashes from plants. REH Kosovo awarded a contract to a Swiss firm, Laufenburg, for an overall study on all aspects of the effects that this project may have.[8]

In 1977, the operating enterprise REH Kosovo had a capacity of 9.5 million tons of

Digitized by Google

lignite, 1.2 million tons of dried lignite, and 400 million cubic meters of manufactured gas from lignite, and it operated five power-generating units with an aggregate capacity of 800 megawatts.

In Macedonia, work continued on development of lignite deposits in the locality of Suvodol in the Bitola basin. Exploration has confirmed reserves of about 300 million tons of lignite with an average calorific value of 1,800 kilocalories per kilogram. A new opencast mine was planned for production of between 2 million and 4 million tons of lignite per year. Two powerplants, Bitola I and Bitola II, with capacities of 210 megawatts each, will use lignite from Suvodol. Rudarsko-Energetski Kombinat Bitola managed the development of lignite mines during 1977 and will operate mines and powerplants when completed sometime between 1981 and 1983.

During 1977, the enterprise operating in the Kreka and Banovici basin, Titovi Rudnici Kreka-Banovici, was reorganized into four working organizations. The following tabulation shows the new organization and facilities operated by each organizational unit:

Organizational unit	Name of mine		Name of coal separation plant
	Open cast	Underground	
Rudnik Mrkog Uglja Djurdjevik	Visca	Djurdjevik	Djurdjevik.
Rudnici Lignita Kreka	Bukinje	Bukinje, Lipnica 1, Lipnica 2	--
Rudnik Mrkog Uglja Tito-Banovic	Cubric	Omazic	Omazic.
Rudnici Lignita Dobruja-Lukavac	Sicki Brod	Mramor and Lukavac	Mramor.

Plans announced during 1977 call for Titovi Rudnici Kreka-Banovici to increase its output of brown coal to 9.7 million tons in 1980. In addition, preliminary work started on opening three new opencast mines—Juzna, Sinklinala, Turija, and Sikulje. Aggregate capacity of these new mines was planned at 11.7 million tons per year after 1980.

Petroleum and Natural Gas.—During 1977, both petroleum and natural gas reached record high production—3.95 million tons of oil and 1,897 million cubic meters of natural gas. However, domestic crude oil production supplied only 28% of the Yugoslav refinery throughput in 1977. Imports from Iran, Iraq, and the U.S.S.R. were essential to meet the demand.

The natural gas supply and demand position was different from that of crude oil in Yugoslavia. Domestic output was more than adequate, and some of the natural gas had to be flared. However, the potential demand for natural gas in the country has not been developed because of a lack of gas pipeline systems, but when systems under construction in 1977 are completed and all potential demand becomes a reality, imports of natural gas will be necessary. Industrija Nafte (INA), headquartered in Zagreb, Croatia, and Naftagas, headquartered in Novi Sad, Serbia, remained the only producers of crude oil and natural gas and the most important processors of petroleum in Yugoslavia. INA was by far the largest, accounting for about 72% of the country's total crude oil output. During 1977, six refineries, three operated by INA (Rijeka, Sisak, and Lendava), two by Naftagas (Novi Sad and Pancevo), and one by Energoinvest (Bosanski Brod), had an installed annual capacity of 17.2 million tons, 4 million tons more than in 1976 because expansion at Rijeka was completed. In addition, four lubricant plants were operational in Yugoslavia during 1977 (Beograd, Maribor, Zagreb, and Krusevac).

Exploration, Development, Production.—About 300,000 meters of wells (both exploratory and development) were drilled in Yugoslavia during 1977, two-thirds of which were accounted for by INA. INA started exploration with its own semisubmersible offshore drilling rig on location along the Adriatic coast, opening a new era in the Yugoslav petroleum industry. However, the Pannonian Basin remained the principal area for active petroleum and natural gas exploration and development. INA started drilling with its own $40 million jackup rig, *Panon*, on June 2 at a site west of Zadar. After drilling one well with shows of gas, INA moved the rig north to the second site 35 miles southwest of the city of Pula. At this site, drilling revealed gas deposits which, according to preliminary testing, may be commercially significant. All other data on the well characteristics were apparently not made public. *Panon* is a jackup rig built in Rotterdam and constructed accord-

ing to the latest state-of-the-art of construction of offshore rigs designed by Levingston Shipbuilding Co. of Texas. Maximum water depth for the new drilling rig is 94 meters, and the rig can drill wells 6,000 meters deep. After completing a series of about 25 exploratory wells in the Adriatic, and if all are dry, Yugoslavia plans to use *Panon* for operations outside the Adriatic.

In addition to drilling offshore, INA continued to drill onshore along the coast of the Adriatic. On the island of Brac, drilling started on an exploratory well planned to reach a depth of 6,000 meters. Drilling started in summer 1977, and at yearend there were no reports on the status of the well on Brac. In the Pannonian Basin, INA was joined by Naftagas in exploration for oil and gas. INA announced the discovery of a "rich" natural gas deposit at a depth of 4,000 meters at Obrovac near Slavonska Orahovica, Croatia. Exploration continued in the Drava River basin in the Peteranec area which, according to preliminary results, appears to be the largest field in the Drava River basin.

Naftagas conducted exploration in Vojvodina, a province of Serbia, and in Serbia proper. In Vojvodina, near Banatsko Veliko Selo near Kikinda, drilling started on an exploratory well with a target depth of 5,000 meters. Apparently, results of this drilling were not made public at yearend. Furthermore, Naftagas carried out a program of exploration in Serbia around the towns of Krusevac and Vranje. In the general area of Krusevac in the Zapadna Morava River Valley, mostly between Trstenik and Krusevac, two wells were drilled. In one well, located near the village of Stopanja, shows of oil and gas were found at a depth of 2,300 meters. In another well, in the vicinity of the village of Globoder, shows of gas were recorded at a depth of 1,500 meters. The economic significance of these oil and gas shows was not made public during 1977.

Near Vranje in southern Serbia, in an area starting at Bujanovac and ending at Vladicin Han, intensive geophysical exploration was underway at yearend. The aim of this exploration was to discover oil and gas; however, the area has a large number of hot springs, and it is hoped that exploration may lead to the possibility for development of geothermal energy.

INA, with a major crude oil field at Benicanci and a natural gas field at Boksic Lug, both in Croatia, and Naftagas, with its largest oil and gas fields near Kikinda, Serbia, remained the only producers of crude oil and natural gas in Yugoslavia. All producing fields were located in the Pannonian Basin.

Benicanci remained the largest operating oilfield in Yugoslavia, and during 1977 it produced about 1 million tons of crude oil or about 25% of the total output. Modernization of the pumping and collecting system was completed in the fall. With new equipment, the gathering system should have a capability to handle an additional 50,000 tons of oil per year, for a total of 1 million tons annually.

In the Coka oilfield near Coka in Banat, Vojvodina, construction started on an oil-collecting system. About 15 wells were completed, but exploration and development drilling continued at yearend. The size of future production at the Coka oilfield was not disclosed. In addition, Naftagas continued development work of oilfields near Mokrin and Palic, Vojvodina.

Refining.—Expansion of capacities of ex-

Digitized by Google

isting refineries and construction of a refinery near Skopje in Macedonia continued.

After 4 years of construction, the annual capacity of the Rijeka refinery in Rijeka, Croatia, operated by INA, was doubled, reaching 8 million tons of crude oil throughput. The production of the additional facilities will be used in the new petrochemical plant on the island of Krk, Croatia, which was under construction at yearend. The petrochemical plant on Krk represents the only foreign investment (by Dow Chemical Co. of the United States) in the mineral-processing sector of Yugoslavia.

Other refineries in the country have plans for further expansion in various stages of implementation. The Sisak refinery in Croatia, operated by INA, has expansion underway that should bring the capacity to 7.5 million tons in 1979. The Bosanski Brod, Pancevo, Novi Sad, and Lendava refineries have plans that call for capacities of 5.5 million, 4.3 million, 2.0 million, and 2.6 million tons per year, respectively, about double the present capacity of these refineries.

Construction continued on a grass roots refinery (2 million tons of crude oil per year) near Skopje, Macedonia, which is designed to process heavy crude from Iran. The U.S.S.R. is providing equipment and technology.

Transportation.—Three major trunk pipeline systems were under construction (one for crude oil and two for natural gas) during 1977.

Construction continued on the pipeline system that will bring crude oil from the Middle East to refineries in Yugoslavia, Hungary, and Czechoslovakia by 1979. The starting point of the 34-million-ton-per-year crude oil pipeline is on the island of Krk near Omisalj, where a deep sea port with berths for two 350,000-deadweight-ton tankers was operational. Cost of the project reached about $510 million, an increase of about 35% over figures published in 1975. A contract valued at $45 million went to Spie-Batignolles S.A., a French engineering and construction company of the Scheider S.A. group, for work to be done on the Omisalj-Sisak section.

Two gas pipeline systems were under construction, one in the western part and the other in the eastern part of Yugoslavia, and are tied with natural gas systems in Austria and Hungary. Both will, in part, use natural gas from the U.S.S.R.

The inauguration ceremony for construction of the natural gas pipeline system in the west took place in March 1977, and completion was scheduled for the end of 1979. The system is about 340 miles long and will supply 26 towns in Slovenia and Croatia with gas from the U.S.S.R. and from local fields. The project includes 50 miles of distribution lines and 344 miles of 16- and 20-inch transmission lines. The network will include 81 metering and regulating stations and will have a total capacity of 2.5 million cubic meters per day. The line crosses the Austrian border near Cersak and proceeds to Rogatec, where it separates into two branches, one to Slovenia and the other to Croatia, near Cakovec, where it will be connected with an existing pipeline system. The Slovenian line to Nova Gorica passes through Celje and Vodice and goes by Ljubljana. It will reach Maribor, Kranj, and Bled Grad. Indications are that the Nova Gorica line may be used for moving gas from Africa and the Middle East as an additional source of supply. The $50 million contract for construction went to Spie-Batignolles as a 50-50 joint venture with Nacap N.V., a Dutch company of Bos Kalis Westminster Group N.V.; engineering was by Gasunie Engineering of the Netherlands.

In eastern Yugoslavia, construction continued on the gas pipeline which passes through Vojvodina and in Serbia branches to Bosnia. The gas was planned to be used for heating in Sarajevo and supplying the Zvornik alumina plant. Financial problems delayed construction. The Mokrin-Senta-Ada-Becej-Gospodjinci trunkline was completed at yearend.

Uranium.—Construction, by Westinghouse Electric Corp., of the first Yugoslav nuclear powerplant (615 megawatts-electric) continued near the town of Krsko in Slovenia. Delays in transportation of heavy equipment from the port of Rijeka to the construction site at Krsko postponed the beginning of operation to May 1979. Work on development of the Zirovski Vrh uranium mine and yellow cake plant by Rudnik Urana Zirovski Vrh of Skofia Loka, Slovenia, also continued, and the beginning of operation was planned for 1979.

The Mineral Industry of Zaire

By Miller W. Ellis[1]

Zaire's mineral industry continued to be the mainstay of the country's economy, and copper accounted for about 60% of the foreign exchange earned by mineral exports. Zaire continued to lead the world in the production of cobalt and industrial diamond and ranked sixth in production of copper. Despite high transport costs and a lack of fuels, copper production increased 8% in 1977, but cobalt and diamond production declined slightly.

Zaire's mineral industry was dominated by the State-owned firm La Générale des Carrières et des Mines (Gécamines), with three major centers in the Zairian copperbelt accounting for the country's output of cadmium, cobalt, zinc, and most of the copper and silver. Shortages of fuel and spare parts curtailed operation of heavy equipment in new pit development and overburden stripping, but production of copper ore, concentrate, and metal increased 8% over that of 1976. As Zaire's chief source of foreign exchange, Gécamines was allowed direct access to 45% of the external credits earned by sales of its mineral products, and the remaining 55% was used by the Government and credited to Gécamines in zaires, the local currency. The zaire was equated with one Special Drawing Right (SDR) of the International Monetary Fund (IMF) in March 1976 and was valued at US$1.25 in 1977.[2]

The allocation of only 45% of Gécamines' total revenue for foreign exchange restricted the company's ability to maintain adequate supplies, spare parts, and fuel from abroad. The Belgian firm Soc. Générale des Minerais (SGM) continued to market most of Gécamines' mineral production, but a new agency, controlled 50% by SGM and 25% each by Gécamines and the Zairian marketing agency Soc. Zairoise de Commercialisation des Minerais (Sozacom), was scheduled to take over this function and that of purchasing and recruiting in Europe by November 1978.

The importance of Zaire's mineral industry to the country's economy increased in 1977 because of improved copper production and diminished returns from its agriculture and manufacturing sectors. Despite Zaire's long-term mineral potential, the effects of the 2-year depression of world copper prices were augmented by domestic financial and administrative difficulties in 1977. Limited availability of foreign exchange restricted orders for equipment and supplies, and increased transport costs and delays in delivery aggravated the problems of maintaining mineral production.

The invasion on March 8 by armed forces along the railway line from Angola had little direct effect on Zaire's copper-cobalt mining industry. However, the resulting evacuation of expatriates employed by contractors working on the Inga-Shaba power transmission line and on construction of new mine plant and housing caused the postponement of Zaire's expansion plans for the mining industry, diminished foreign investment, and prompted a rescheduling of external debt financing.

Gécamines' facilities for producing and processing copper and cobalt have gradually shifted to its western group of mines near Kolwezi as part of an overall program to expand and modernize the industrial complex on a time schedule geared to the completion of the Inga-Shaba powerline terminal at Kolwezi. Despite the financial restrictions imposed by low copper prices since late 1974 and transport problems following the Angolan and Mozambique border closures during 1975 and 1976, Gécamines has managed to meet most of its interim targets and to produce mineral exports accounting for most of the nation's external income.

PRODUCTION

Mine production of copper and zinc was higher in 1977 but did not attain the 1973-75 levels because of the continued shortages of fuel and supplies. Byproduct silver production increased 10%, tin ore (cassiterite) 34%, tungsten 32%, and coal 28%. Gécamines' production of byproduct cobalt and cadmium declined about 8% to the lowest levels reported since 1967 and 1956, respectively. Other production decreases included diamond 5%, cement 25%, gold 24%, and manganese ore 60%. Details of mineral production are shown in table 1.

TRADE

During 1977, the Soc. de Developpement Industriel et Minière du Zaire (Sodimiza) shipped copper sulfide concentrates by rail through Zambia, Southern Rhodesia, Botswana, and the Republic of South Africa for dispatch from the port of East London to Japan. The same rail route was used for a substantial part of Zaire's other mineral exports, and the returning railcars brought fuel, foodstuffs, and other supplies to the Zairian copperbelt. About one-half of Gécamines' mineral exports were transported by the State-owned Voie Nationale, using a route which included some 1,200 kilometers by rail to Ilebo on the Kasai River, about 1,000 kilometers by barge down the Kasai and Zaire Rivers to Kinshasa, and 366 kilometers by rail down the 650-meter scarp to the port of Matadi on the Zaire River. Some 60 kilometers of the Zaire River outlet to the Atlantic Ocean was subject to constant survey and dredging to maintain a channel for ocean freighters with a draft of less than 28 feet. This transport route has the advantages of being entirely controlled by the Zairian Government, providing employment for Zairian workers, and requiring a minimum of foreign exchange. Transshipment damages and delays in transit were expensive drawbacks. Various plans to alleviate these problems have been under consideration for a number of years. They include construction of a deepwater port at Banana on the Atlantic Ocean, a railroad from Banana to Matadi including a dual-purpose bridge across the Zaire River at Matadi, a rail link from Matadi or Kinshasa to Ilebo to obviate transshipment to and from river barges, and improved Ilebo and Kinshasa river-port facilities and barges equipped for carrying loaded railcars between the two ports.

Use of Shaba's alternate export route by rail to Kalemie on Lake Tanganyika, by lake steamer to Kigoma, and by the Tanzanian railroad to Dar es Salaam was restricted by increased port congestion and charges.

Data on copper exports by type and destination in 1975-77 are given in table 2.

COMMODITY REVIEW

METALS

Copper, Cobalt, Zinc, Associated Metals (Shaba Region).—Although shortages of fuel oil and coke continued during 1977, Gécamines' production of blister copper was reported at about 452,000 tons, 11% over that of 1976. Production of refined copper increased nearly 50% from more than 66,000 tons in 1976 to nearly 99,000 tons in 1977, but it was still far below the 1973-75 levels. Increased production of domestic coal and blending with imported fuels were largely responsible for the increase. Gécamines' cobalt metal production decreased 4.4% from 10,686 tons in 1976 to 10,215 tons in 1977 because of a reported decline in cobalt content of the ore. Byproducts included 246 tons of cadmium, 3,600 troy ounces of gold, and nearly 2,730,000 troy ounces of silver.

Construction of the Dikuluwe-Mashamba (Dima) crushing plant, the concentrator, extensions to the Kamoto concentrator, the Luilu refinery, and additional housing at Kolwezi was interrupted by the invasion in March but was resumed later in the year.

Gécamines' ability to meet many of the interim targets of its expansion program and to continue generating the major part of the nation's income was achieved at the expense of two important aspects of its long-term policy (only minimal funds were available for replacing equipment and stocks of spare parts and for maintaining adequate supplies of consumable stores such as diesel fuel). Transport difficulties delayed or reduced deliveries, particularly of diesel fuel, and as a result, stripping of overburden was far below its scheduled rate. In 1976, the shortfall of overburden stripping in Gécamines' western area (the Kolwezi group of pits) amounted to nearly 11 million cubic meters or about 40% of that scheduled. For 1977, the shortfall amounted to some 12 million cubic meters. During both years, short-term ore production was maintained, but long-term pit planning was complicated by the premature deepening rather than lateral enlargement of the pits, diminishing the number of potential faces for ore extraction. Idle earthmoving equipment from the stripping areas was available to replace disabled equipment in the mining areas.

Most of Gécamines' copper and all of its cobalt ores came from its opencast mines near Kolwezi (western area) and Likasi (central area) and were initially processed at both of these centers. Oxide concentrates were leached and the metals were recovered electrolytically. Sulfide ore from the Kamoto underground mine at Kolwezi was treated at the Kamoto concentrator, and the copper sulfide concentrate was shipped to Lubumbashi for smelting to produce blister copper. Cobalt-rich sulfide concentrate from Kamoto was roasted and leached, and the metals were recovered at the nearby Luilu refinery. All of Zaire's zinc and cadmium came from Gécamines' underground mine at Kipushi, located 35 kilometers west of Lumbumbashi near the Zambian border. Copper sulfide concentrate from Kipushi was smelted at Lubumbashi, but the zinc sulfide concentrate was shipped more than 400 kilometers west to Kolwezi where 51,000 tons of zinc was produced as refined ingots. The Kolwezi facility also produced refined cadmium, silver, and sulfuric acid for consumption in the leaching and electrowinning of copper.

Sodimiza, operated and 80% owned by a consortium of Japanese companies and 20% owned by the State, produced 81,000 tons of copper sulfide concentrate containing 28,000 tons of copper metal at its Musoshi plant for shipment to Japan for smelting. Most of the ore came from its Musoshi mine, but higher grade ore from its new Kinsenda mine was added to the concentrator feed late in the year. Sodimiza's operations, located 40 to 100 kilometers southeast of Lubumbashi near the railroad and the Zambian border, were not directly threatened by the March invasion but continued to operate at a loss because of low copper prices and the high cost of transporting its concentrate through Zambia, Southern Rhodesia, and Botswana to a South African port.

Soc. Minière de Tenke-Fungurume kept its partially completed copper-cobalt mining and metallurgical complex on a care-and-maintenance basis but was considering plans for limited production at yearend. The consortium of British, United States, Japanese, and French companies has reportedly invested $280 million in the project, and it was estimated that an additional $500 million would be required for its completion. The complex was designed to produce about 100,000 tons of copper and 5,000

Digitized by Google

tons of cobalt annually from ore deposits located between Gécamines' Likasi and Kolwezi installations.

The French Bureau de Recherches Géologiques et Minière (BRGM) announced in late 1977 that the Zairian Government had granted a subsidiary company, Soc. Minière de Goma (SMDG), permission to develop copper deposits near Kapulo, north of Lake Mweru in the eastern part of the Shaba Region. SMDG was also interested in tin and zinc deposits in the Kivu Region.

Columbium-Tantalum, Gold, Tin, Tungsten.—Production of cassiterite and tin metal from Société Zairetain's mines and smelter near Manono in the Shaba Region increased substantially in 1977. The company was Zaire's only producer of tantaliferous slag and was seeking capital for construction of a plant to produce lithium carbonate from its reserves of spodumene associated with its cassiterite ore. The 20%-State-owned Soc. Zairoise Minière de Kivu (Sominki) reportedly produced 4,060 tons of cassiterite, 317 tons of wolframite, 83 tons of columbite-tantalite, 94 tons of monazite, and 16,525 troy ounces of gold from its various mines in the Kivu Region. The Kilo-Moto mine, in the Haute-Zaire Region, reported an 11% drop in gold production from 66,809 troy ounces in 1976 to 59,479 troy ounces in 1977.

Manganese.—The State-owned manganese mining company Soc. Minière de Kisenge (SMK) reported the production of 41,000 tons of ore from its manganese mines near Kisenge in the western part of the Shaba Region. After the occupation of the area by invaders from Angola in March 1977, mining operations were suspended, and at yearend, a stockpile of some 500,000 tons of manganese ore was reportedly awaiting shipment when the Benguela Railway resumes operations. The company reported no damage to its mining and ore-processing installations, but extensive looting of its offices and housing facilities resulted from the invasion. Less than one-half of SMK's executive staff had returned to work and a large portion of the company's laborers were still missing at yearend.

NONMETALS

Cement.—Zaire's cement production declined 22% from 630,000 tons in 1976 to 489,000 tons in 1977, largely because of a lack of fuel and spare parts at all plants. Approximately 44,000 tons of cement was produced by Cimenteries du Shaba (Cimshaba) from its three rotary kilns in Lubumbashi. Gécamines had arranged to buy 40% of Cimshaba's stock in December 1976 but was unable to supply foreign exchange in payment until yearend 1977. With the funds from Gécamines and a $2.75 million credit from the Zairian State Finance and Development Co., Cimshaba planned to increase its capacity to 162,000 tons per year by 1980. Gécamines' wholly owned subsidiary Calcaire, Chaux, Cimente (C.C.C.), formerly Ciments Métallurgiques de Likasi (CML), produced 403,376 tons of limestone from its quarries at Kakontwe, near Likasi. Its adjacent kilns produced 92,609 tons of burned lime and 13,540 tons of cement for consumption by the parent company. The Cimenterie Nationale (Cinat) plant, which began production in 1974 at Kimpese in the Bas-Zaïre Region, produced 144,659 tons of cement in 1977, less than one-half its rated capacity. Individual production data were not available for the Ciments Lacs SZARL plant near Kalemie on Lake Tanganyika or for the large Soc. des Ciments du Zaire (CIZA) plant near Kinshasa.

Diamond.—Zaire's diamond production dropped 5% to a new low of 11,213,000 carats in 1977, of which only about 5% was classified as gems. The Soc. Minière de Bakwanga (MIBA) was the world's largest producer of industrial diamond from its weathered kimberlite and adjacent alluvial deposits near Mbuji-Mayi in the eastern Kasai Region. MIBA's alluvial deposits were nearing exhaustion, and new technology and equipment were required to treat the harder kimberlite encountered in its deeper pits. MIBA's production was marketed by Zaire British Diamond Distributors Ltd. (Britmond), the local affiliate of De Beers' Central Selling Organization. A diamond-buying market in Tshikapa provided an outlet for small-scale operators working nearby alluvial deposits and old tailings dumps near the Angolan border.

MINERAL FUELS

Coal.—Production of low-grade coal by Soc. des Charbonnages de la Luena reportedly increased during 1977. Most of the output was blended with imported coal and consumed at Gécamines' copper facilities, but part of it was used in the production of cement and lime. The Republic of South Africa, Southern Rhodesia, the Federal Republic of Germany, and Zambia were the chief sources of Gécamines' imported metallurgical coal and coke.

Digitized by Google

Petroleum.—Zaire Gulf Oil Co., the manager of Zaire's offshore oilfield, reported that 8,255,000 barrels of crude oil was produced in 1977. Zaire's Moanda refinery near Banana imported 168,336 tons of crude petroleum and produced 32,393 tons of gasoline, 18,352 tons of jet fuel, and 42,980 tons of fuel oil. A substantial quantity of imported gasoline and diesel fuel was consumed by the mining industry in the Shaba Region.

The Mineral Industry of Zambia

By Miller W. Ellis[1]

Zambia's mineral industry provided more than 90% of its foreign exchange credit, and maintained the country's position as the world's fifth largest copper producer in 1977. The continued low price of copper, combined with increased costs caused by delays on the Tanzania-Zambia Railway (Tazara) and congestion at the port of Dar es Salaam, resulted in a net loss for the two major copper-producing companies and diminished availability of foreign exchange. Import permits were granted only for essential items, and applications for external funds were approved on a priority basis only when foreign exchange credit was available.

Zambia's 1977 gross domestic product (GDP) was slightly lower in terms of U.S. dollars, at $2,435 million[2] in 1977 compared with $2,686 million in 1976, Although it increased slightly when measured in domestic currency. Export earnings declined from $1,054 million in 1976 to $877 million in 1977, and the value of imports increased from $657 million to $697 million. An increase of $51.5 million in expenditures for machinery and electrical equipment was responsible for the additional import value.

PRODUCTION

Zambia's blister copper production decreased nearly 8% from 706,000 tons in 1976 to 650,500 tons in 1977. Mine production of cobalt increased 13%, and that of lead and zinc decreased 13% and 8%, respectively. Details of mineral production are shown in table 1.

TRADE

Following the departure of Chinese technicians, the Tazara system experienced major operational problems because of inexperienced staff and inadequate maintenance, both along the line and at the port of Dar es Salaam. The Tanzania-Zambia (TanZam) road haulage service was inadequate to relieve the situation, and by yearend the transport time between the Zambian Copperbelt and Dar es Salaam had reportedly increased from 12 days to 22 days. This nearly doubled the tonnage of copper in transit to the port, and, with increased stocks attracting demurrage charges on the docks, the postproduction cost of Zambia's copper was substantially increased. Alternative routes through Malawi and Mozambique to the ports of Nacala and Beira could not be fully used during the rainy season because of bad roads. A maximum weight of 14 tons per vehicle restricted use of the Botswana road route through Francistown and Kazungula.

Changes in the routing of Zambia's exports and imports since 1972 are shown in table 2.

Zambia's favorable balance of trade with the United States diminished substantially in 1977. The value of exports to the United States declined 39% from nearly $150 million in 1976 to $92 million in 1977, while the value of U.S. imports increased 22% from about $60 million to nearly $73 million. Exports to Japan and the Federal Republic of Germany exceeded imports from those countries by factors of nearly 5 and 1.6, respectively, but exports to the United Kingdom continued to be only about 90% of imports. The value of Zambia's 1973-77 trade is shown in the following tabulation, in million dollars:

Digitized by Google

	1973	1974[r]	1975	1976	1977[e]
Total exports	1,160	1,419	[r]816	1,054	877
Copper exports	1,092	1,309	735	965	819

COMMODITY REVIEW

METALS

Copper and Byproduct Cobalt.—The two major Zambian copper companies mined and treated nearly 32.5 million tons of ore containing nearly 837,000 tons of copper and 8,650 tons of cobalt during fiscal 1977. The 15.1 million tons of ore treated by Roan Consolidated Mines Ltd. (RCM) in its fiscal year ending June 30, 1977, contained nearly 319,000 tons of copper and 3,550 tons of cobalt. RCM's production of finished copper was reported at 261,444 tons and sales at 265,446 tons, 7% and 2% lower, respectively, than the fiscal 1976 figures. The average sales price increased 13% to $1,419 per ton; production costs were reportedly $1,022 per ton f.o.b. mine, 7% above the $953 per ton in 1976, but the cost of transport and sales increased substantially.

The Mufulira underground mine was responsible for over one-half of RCM's copper production. Underground development work and improvement of materials handling at the smelter progressed slowly because of the shortage of funds. The electric furnace was shut down for major overhaul in January, and anode production, from the two reverberatory furnaces only, decreased in the early part of the year. Because of increasing world demand for cathode copper, the wirebar casting plant was shut down for most of the year.

Development work was curtailed at Luanshya, where ore dilution and working costs increased and both the quantity and grade of the ore declined. Better ground conditions and higher ore grades with significant cobalt content at Baluba were reflected in greater output during 1977. Equipping of 1,000 meter shafts at both the Chambishi and Chibuluma mines continued, and overburden stripping at the Chambishi and Kalengwa open pits was nearly completed. Cobaltiferous concentrates from Baluba and Chibuluma ores continued to be treated at the Chambishi roast-leach plant, and the cobalt hydroxide product was shipped to NCCM's Rokana cobalt plant where 698 tons of cobalt was recovered as metal. RCM's plant at Ndola for treatment of tankhouse slimes was operational for RCM's refinery slimes during part of the year. The first gold bar was poured in May 1977, but further improvements were needed, especially in the selenium recovery section, for the capacity to treat all of Zambia's copper refinery slimes.

The following tabulation shows ore mined and treated and ore reserves for the various mines operated by RCM for fiscal 1977:

Digitized by Google

Mine	Ore mined and treated			Copper produced (metric tons)	Ore reserves	
	Gross weight (thousand metric tons)	Percent copper	Copper content (metric tons)		Gross weight (thousand metric tons)	Percent copper

[1]Underground.
[2]Open pit.
[3]Includes 12,572 tons of toll production for other mines.

Nchanga Consolidated Copper Mines Ltd. (NCCM) treated 17.4 million tons of ore with copper and cobalt contents of 518,000 tons and 5,100 tons, respectively, in it's fiscal year ending March 31, 1977. Finished copper production increased 11% to 427,801, tons and sales increased 10% to 425,931 tons.

Near the end of March 1977, heavy rains caused flooding at the Nchanga open pit and underground mine. As a result, production of ore from the eastern high-grade areas of the lower ore body in the underground mine was restricted until September, and the high-grade zones of mineralization in the open pit remained inaccessible at yearend. Nearly normal ore production from alternative areas of slightly lower grade was maintained in both the open pit and underground mines while dewatering and rehabilitation work continued. A shortage of lime continued to restrict full operation of the Nchanga tailings leach plant throughout the year, but construction of the stage 3 extensions to treat an additional 700,000 tons per month of reclaimed tailings was well advanced at yearend. Deepening of Rokana's Mindola sub vertical shaft, development work on the 3,140 and 3,400 levels, and mining of the central shaft declines to the 3,760 level continued. Production at Rokana continued to be hampered by poor ground conditions and wet ore. The Rokana cobalt plant treated 43,706 tons of cobaltiferous concentrate and produced 999 tons of finished cobalt from Rokana ore as well as 665 tons of cobalt metal for RCM. Ore and concentrate production at Konkola continued at a satisfactory rate, and recovery of copper improved. Water continued to be a major problem at Konkola, where the pumping rate for fiscal 1977 averaged 403,014 cubic meters per day or more than 83 tons of water per ton of ore. Exploration at NCCM's Kansanshi mine continued, and mining commenced in June 1977 at the rate of 15,000 tons per month. The ore, containing about 3.30% copper, was hauled 160 kilometers east to Chingola for treatment. Following metallurgical testing, ore reserves on Kansanshi Hill were recalculated at 10,217,000 tons with 2.99% copper, of which 2.32% was acid soluble. Additional ore reserves underlying the hill contain substantial amounts of sulfide copper but were not recalculated. NCCM's Nampundwe pyrite mine west of Lusaka produced 21,811 tons of pyrite concentrate containing 42.2% sulfur and 1.5% copper. The concentrate was shipped to the Rokana smelter and acid plant for treatment.

Production and ore reserves statistics for NCCM in fiscal 1977 are shown in the following tabulation:

[1]Underground
[2]Open pit.
[3]Underground pyrite mine.

In September, Thomson-Brandt S.A. announced that both NCCM and RCM would share in the wire factory of its new subsidiary, Société de Cuivre S.A., at Chauny, Aisne Department, France, which was scheduled to produce 130,000 tons of copper wire per year.

Lead and Zinc.—The Broken Hill Div. of NCCM produced and treated 253,000 tons of galena-sphalerite ore containing 5.5% lead and 19.1% zinc during its fiscal year. Finished output included 15,034 tons of refined lead, 11,944 tons of high-purity zinc, 21,663 tons of over 98.5% zinc, and 67,034 troy ounces of silver. No byproduct cadmium was reported, and sulfuric acid production ceased when the roaster was shut down in August 1976. In February, the conditioning tower of the No. 1 Waelz kiln overheated and collapsed, damaging both the No. 1 and No. 2 Waelz kilns and the cupellation furnace. Rehabilitation of all units was completed during the year. A 40% force majeure was imposed on lead shipments from Zambia in July and subsequently revoked in September.

Other.—Manganese mines west of Mansa were reopened during the latter part of the year, and a crushing plant at Mansa commenced pulverizing the manganese dioxide ore for battery manufacture by Zambia's Industrial Development Corp. (INDECO). The Finnish company Oy Airam AB was codeveloper and 30% owner of the factory which was scheduled to utilize zinc from Broken Hill and approximately 770 tons of local manganese ore per year to produce about 33 million dry cells annually.

About 3 tons of cassiterite (tin ore) was produced from Mindeco Small Mines Ltd.'s (MSML) cooperative area east of Choma. The Yugoslav-Zambian company Foundry and Engineering Co. Ltd. at Luanshya commenced smelting cassiterite and producing tin ingots as well as bronze castings for local consumption, chiefly in the mineral industry.

NONMETALS

Chilanga Cement Ltd. reportedly produced about 300,000 tons of cement from its three coal-fired rotary kilns south of Lusaka. Most of the product was consumed locally, but some exports to neighboring countries were reported. Ndola Lime Co. Ltd. reported production of 250,000 tons of limestone for smelter flux, 200,000 tons of quicklime, and 7,500 tons of hydrated lime, mostly for consumption by the copper industry. Approximately 4,000 tons of gypsum was produced at the Lochinvar mine by MSML. MSML also produced magnetite near Lusaka for use in the heavy-media coal beneficiation plant at Maamba, about 830 tons of feldspar and fluorite from its mine near Kariba for flux at the Kapiri Mposhi glass factory, and 91 kilograms of emerald from the Kafubu area south of Chibuluma. Illicit mining of emerald reportedly increas-

Digitized by Google

ed during 1977. Amethyst mining continued in the Zambezi scarp area 135 kilometers northeast of Livingstone.

MINERAL FUELS

Maamba Collieries Ltd. produced 708,000 tons of coal from its open pit mine and beneficiation plant at the foot of the Zambezi scarp 240 kilometers southwest of Lusaka. A rail spur from Batoka to Musuku on the scarp crest facilitated transport to the Copperbelt.

Indeni Petroleum Refining Co., Ltd., imported 800,000 tons of crude oil through the Tazama pipeline for its refinery at Ndola from which most of the country's gasoline and diesel fuel requirements were supplied. Ammonium nitrate-fuel oil explosives were manufactured at Kafironda on the Kafue River southwest of Mufulira, and heavy fuel oil and residues supplemented coal as fuel for the copper industry.

BÉNIN[1]

The mineral industry of Bénin contributed less than 1% of the 1977 gross domestic product (GDP), which was estimated at $500 million.[2] Other than limestone and salt, no exploitable mineral deposits have yet been discovered in Bénin, which has been rated by the United Nations as one of the world's least developed nations. In 1977, the economy was further weakened by petroleum price increases and severe drought. The country continued to depend on foreign assistance, which averaged $20 million per year, to finance development projects. The country's first 3-year plan, which was put into operation in October 1977 after many delays, allocated more than $1 billion to projects in infrastructure, agriculture, and light industry.

The most important infrastructure project was the expansion and modernization of the port of Cotonou, valued as an entrepôt port for the transit of goods to the neighboring countries of Niger and Nigeria. Plans called for an increase in handling capacity to 1 million tons of cargo annually, the improvement of port and cargo handling operations, and the upgrading of the efficiency of the Port Autonome de Cotonou (PAC) management system. The $46 million project was to be financed by a consortium led by the International Bank for Reconstruction and Development (IBRD) and including Canada, France, Nigeria, and Abu Dhabi. Construction was scheduled to begin in 1978 and be completed in 1980.

The United Nations Development Pro-

Digitized by Google

gram (UNDP) was to complete its assessment of phosphate, iron, gold, and marble deposits by January 1978. The 5-year program conducted by the UNDP focused on geological surveys and mapping, the training of nationals, the establishment of a geochemical laboratory, and the drafting of a mining code for the Government. Phosphate deposits near Kandi were shown to be of potential commercial value if access routes and transport facilities could be provided. Studies continued on the Loumbou Loumbou iron ore deposits, which were estimated to contain 250 million tons of hematite ore averaging 50% iron. Gold deposits south of Natitingou and marble deposits in the Dadjo Region were also the subject of feasibility studies.

The clinker-grinding plant at Cotonou, operated by Société des Ciments du Bénin, produced approximately 140,000 tons of cement in 1977. Cement production was marketed internally by Société Béninoise de Matériaux de Construction. Exports, which went primarily to Niger and Nigeria, were handled by Société Nationale de Comercialisation et d'Exportation du Bénin. Work continued on the construction of a second clinker-grinding plant in Cotonou by the Société Nationale des Ciments. The 200,000-ton-per-year plant was financed by the Arab Bank for Economic Development in Africa and the Bénin Government.

Société des Ciments d'Onigbolo, a joint venture of Bénin and Nigeria, was to construct a third cement plant at an estimated cost of $75 million. The 500,000-ton-per-year plant was to be based on the limestone deposits in Onigbolo and Massé in the southeastern Pobé area. Reserves at the two deposits were reported at 36 million tons.

Salt production remained at low levels in 1977, although capacity was rated at 3,000 tons per year. The modernization of production facilities that manufacture salt from seawater at Cotonou continued throughout the year.

The 3-year plan called for an investment of $200 million in offshore petroleum exploration. In 1977, the Government completed seismic surveys in a concession area previously held by Union Oil Co., whose rights were terminated along with those of five other companies in 1974. Indemnification agreements were reached with most of the affected firms by yearend 1977. Bénin imported approximately 2.5 million barrels of petroleum products in 1977; distribution was by the State agency, Société Nationale de Comercialisation des Produits Pétroliers (SONACOP). The construction of a 17,000-barrel-per-day petroleum refinery in Cotonou was still in the planning stages.

[e]Estimate. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the countries listed, Equatorial Guinea, the Gambia, São Tomé and Principe, and Upper Volta, which are covered in the text of this chapter, presumably produce modest quantities of a variety of crude construction materials (clays, stone, and sand and gravel) and may produce minor amounts of other mineral commodities (most notably gypsum, lime, and salt), but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[2]In addition to the commodities listed, modest quantities of unlisted varieties of crude construction materials (clays, stone, and sand and gravel) presumably are produced, but output is not reported quantitatively and available information is inadequate to make reliable estimates of output levels.

[3]Limited quantities of other pegmatite minerals may also be produced, but output is not reported.

[4]Products marketed under the trade names "Balifos" and "Phospal."

[5]Data represent sales; actual production is not reported.

BURUNDI[3]

The mineral industry was a minor factor in the economy of Burundi. The Government's main emphasis in national development has been the diversification of agricultural production and the construction of a firm foundation for industrialization. Mineral production contributed approximately 2.4% of the total national export value of $1.08 million[4] in 1977. Mineral production was limited to small tonnages of bastnäsite and cassiterite concentrates. Deposits of nickel, uranium, cobalt, copper, and platinum were as yet unexploited. The possibility of developing Burundi's lateritic nickel deposits has attracted the attention of a number of foreign countries, including the United States. Nickel reserves were reported in 1977 at approximately 300 million tons of ore of 2% nickel with some copper, cobalt, and platinum content. The deposits

Digitized by Google

were located in the eastern and southern part of the country. A U.S. firm was contracted by the United Nations to conduct a detailed mining and metallurgical study of the nickel-bearing laterites.

The UNDP was to finance a program of research and development of the extensive peat deposits at Akanyaru, in addition to the nickel deposits at Musogati.

An analysis of the national transportation network was completed in 1977 by U.S. consultants. By yearend, offers of financial assistance were received from foreign nations for the development of a new transport program. Among the offers received, the European Development Fund (EDF) agreed to provide $27.7 million for the construction of the Myuinga-Kobera-Husomo-Nzega road that will connect with the Kigoma-Dar Es Salaam railroad. The Saudi Arabia Development Fund made available an additional $11 million to the Government for assistance with the transport network.

Construction began on a hydroelectric station at Mugere. Financing of the $1 million facility was to be provided by mainland China. Upon completion in 1979, the station will supply electrical power to Bujumbura, which has relied on the powerplant at Bukaru, 109 kilometers away. The capacity of the Mugere station was expected to reach 6 megawatts during the rainy season and 2 megawatts in the dry season.

CAMEROON[5]

Mining in Cameroon played an insignificant role in the nation's economy in 1977. Small amounts of cassiterite, cement, gold, limestone, marble, and construction materials were produced from domestic sources. Aluminum was produced from imported alumina and cement from imported clinker. Fertilizers were also produced by processing imported materials. Late in the year crude oil production was initiated at a rate of between 8,000 and 9,000 barrels per day from a single offshore platform. Cameroon had known resources of bauxite, copper, kyanite, iron ore, natural gas, and uranium-thorium that were not being exploited in 1977. The Government continued to support prospecting for mineral resources, with primary focus on iron ore in southeastern Cameroon.

The fourth development plan (1976-81) called for significant investment to develop Cameroon's port, railroad, highway, and airport infrastructure. Expansion and modernization of the nation's major port, Douala, began in late 1976 and was to increase the port's handling capacity to 5 million tons per year. Over $300 million was to be invested in realining and refurbishing the Yaounde-Douala section of the Trans-Cameroon railroad, and work began on the Douala-Edea section in 1977. The Government with World Bank and other donor support planned to upgrade and realine the highways between Yaounde and Baffoussam and also between Douala and Yaounde. The Government intended to expand the road system in Nord Province and to construct roads to allow for the development of important resources of iron ore and timber in Center Sud Province. The new Douala air terminal went into service in May 1977, and the Garoua airport was being upgraded to accommodate modern jet aircraft.

Digitized by Google

The development of Cameroon's hydroelectric power potential was a major Government priority. Installed electric power production capacity in 1977 was 314 megawatts, 263 megawatts hydroelectric and 51 megawatts thermal. Major projects were the Song Loulou dam on the Sanaga River (288 megawatts) and the Lagdo Dam on the Bénoué River at Njock (72 megawatts). A 225-kilovolt system was planned to link the Lagdo project with Goroua, Figuil, Kaele, and Moroua. Power from the Song Loulou facility was to be used in the planned expansion of the Edea aluminum refinery, the planned petroleum refinery near Victoria, and a new paper pulp factory.

Production of aluminum by Compagnie Camerounaise de l'Aluminium Pechiney-Ugine (ALUCAM) decreased from 57,700 tons in 1976 to 55,600 tons in 1977, or 93% of the Edea smelter capacity. The Edea smelter imported alumina from Guinea and produced a variety of aluminum products including ingot, sheet, plate, and household utensils. Nearly 32,000 tons of aluminum products was exported during 1977 with a value of approximately $35.6 million, or 5.1% of the total value of all exports during the year.

Société d'Etudes des Bauxites du Cameroun (SEBACAM) completed its feasibility study on development of bauxite deposits near Minim and Martap in Nord Province approximately 100 kilometers south of Ngaoundéré. Reserves of over 1 billion tons have been identified, but the lack of sufficient infrastructure for transport or local processing has deterred development.

Preliminary investigations have indicated that substantial resources of iron ore were located in southern Cameroon. The Canadian Government funded the initial mineral survey in this area, and teams provided by the UNDP were conducting more detailed studies during 1977.

Cement production from Cimenteries de Cameroons' (CIMENCAM) two-kiln plant at Fujuil and the Bonaberi clinker-grinding facility totaled 362,900 tons in 1977, a 21.4% increase over the 1976 output of 298,900 tons. A reported 316,800 tons of clinker was imported to supply the Bonaberi grinding plant, which was to be expanded from 300,000 tons per year to 480,000 tons per year by yearend 1978.

Cameroon became Africa's 10th oil producer when production of crude oil from the Kole Marine oilfield began in late November 1977 at an initial rate of 8,000 to 9,000 barrels per day from seven producing wells. The field, located in the offshore Rio del Rey permit (1,126 square kilometers), was owned 51% by Essence et Lubrificants de France-Société de Recherches et d'Exploitation des Pétroles du Cameroun (Elf-Serepea) and 49% by la Société Pecten Cameroon, an affiliate of Shell Oil Co. The 31.4° API gravity crude oil was stored in a 75,000-ton vessel moored near the production platform in 52 feet of water. Output was to increase to over 15,000 barrels per day when an additional nine wells were completed in 1978. Development of two smaller oilfields in the Rio del Rey permit was to bring Cameroon's oil production to 30,000 to 35,000 barrels per day by yearend 1979.

Cameroon planned to construct a 30,000-barrel-per-day oil refinery at Point Limboh near Victoria. Total investment was estimated to be $200 million, although financing and contractual agreements had not been arranged in 1977. During 1977, Cameroon imported approximately 450,000 tons of petroleum products valued at over $91 million, or nearly 12% of the value of all imports during the year.

CAPE VERDE ISLANDS[6]

Mineral production in the Cape Verde archipelago was limited to modest quantities of crude construction materials such as clays, stone, and sand and gravel, and also solar-evaporated salt. The Government has embarked on a program of well drilling to assess the country's underground water resources and of building facilities to impound water from the infrequent but torrential downpours.

CENTRAL AFRICAN EMPIRE[7]

The mineral industry of the Central African Empire in 1977 was based primarily on the production of diamond, which registered an increase of 4% to nearly 297,000 carats. As a result of international diamond market speculation, the average price of Central African Empire diamond increased 55% to $79[8] per carat in 1977. Diamond exports amounted to $21.6 million, representing 22% of the Central African Empire's total export value. The principal purchasers of diamond in 1977 were Belgium (62%), the United States (15%), and Israel (14%). Problems persisted with undeclared exports of diamond, which reportedly reached 100,000 carats per year.

The Government conducted feasibility studies for the exploitation of the Vakago copper reserves. Also, a systematic analysis of the southern region focusing on the granitic rocks and the construction of a chemical analysis laboratory in Bangui were planned. The joint Central African-Arab-Libyan Mining Co. (SOCALIMINES) was formed during 1977. SOCALIMINES announced expenditures in excess of $42 million over the next 5 years for the prospecting of gold and other minerals. By yearend, no other details were available.

Most diamond found in the Central African Empire was by diggers working numerous small-scale alluvial operations. Large-scale mining of alluvial deposits remained financially unfeasible. No true kimberlite deposits have been discovered in the country. Negotiations were underway at yearend between the Central African Empire, a United States-Canadian joint venture, and an Israeli firm concerning the resumption of mining and dredging operations which ceased in 1976.

Discovered 15 years ago by the French Atomic Energy Commission, the uranium deposit at Bakouma was estimated to contain 17,000 tons of uranium phosphate ore with a metal content of 8,000 tons. In 1975, Société d'Uranium Centrafricaine was formed by the Government, the French Atomic Energy Commission, and Alusuisse of Switzerland for the development of the Bakouma deposit. Feasibility studies indicated that exploitation was economically and technically viable. Preliminary construction at the Bakouma site was scheduled to begin in 1978 with initial production expected in the middle 1980's. Current deposits were estimated to be economically viable for 11 years.

A consortium of petroleum companies consisting of Continental Oil Co. (Conoco), Chevron Oil Co., Shell Oil Co., and Exxon Corp. had petroleum exploration concessions totaling 150,000 square kilometers in the Central African Empire. Exxon acquired a 12.5% interest in the venture from Conoco in 1976. With Conoco as operator, the group relinquished the southern portion of the concession but retained the rights to 74,000 square kilometers of the northern region. Two months of aeromagnetic and seismic surveys were the only activities reported in 1977.

Table 2.—Central African Empire: Trade in mineral commodities

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources and destinations, 1975
EXPORTS			
Diamond: Gem, not set or strung value, thousands	$9,384	$9,236	United States $3,917; Belgium-Luxembourg $2,827; Israel $2,236.

Table 2.—Central African Empire: Trade in mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1974	1975	Principal sources and destinations, 1975
IMPORTS —Continued			
Nonmetals —Continued			
Fertilizer materials, manufactured:			
Nitrogenous	387	--	
Potassic	3,473	--	
Other	61	728	France 657.
Salt and brines	4,071	4,075	Guinea 3,871.
Fuels and related materials:			
Asphalt and bitumen, natural	--	14	All to Yugoslavia.
Petroleum refinery products:[1]			
Lubricating oils and greases	424	477	NA.
Nonchemical coal and petroleum wastes	1,462	--	
Other	179	614	France 123.

NA Not available.

[1]Because of the limited amount, petroleum products are not converted to 42-gallon barrels.

CHAD[9]

The mineral industry of Chad, a landlocked nation covering nearly 500,000 square miles in the heart of north-central Africa, played an insignificant role in the country's economy in 1977. Mineral output was confined to small amounts of trona, clays, salt, and local requirements of building materials. Trona, locally called natron, was the only mineral product that was exported, with small amounts going to neighboring Nigeria and Sudan.

Mineral surveys conducted by French interests and by the UNDP have discovered evidence of gold, nickel, uranium, complex sulfide ores, and small amounts of diatomite, kaolin, and limestone. Continental Oil Co. of Chad (Conoco-Tchad) continued to explore for oil on a 174,000-square-kilometer concession in southern and west-central Chad. Conoco-Tchad was owned by Shell (50%), Chevron (25%), Esso (12.5%), and the operator Continental (12.5%). Conoco-Tchad completed the Kadeni No. 1 well in southern Chad in June and was drilling the Mangara No. 1, also in southern Chad, at yearend.

The Government and the Cononco-Tchad consortium formed Société d'Étude et d'Exploitation de la Raffinerie du T'chad (SEERAT), which was to build a refinery at N'Djamena and a 350-kilometer-long, 15-centimeter-diameter pipeline from the small Sedigi oilfield near Lake Chad to the refinery. Construction of the 1,500-barrel-per-day unit was to begin in 1978 and be completed by late 1979.

REPUBLIC OF THE COMOROS[10]

No exploitable minerals have yet been discovered in the Republic of the Comoros, an archipelago of islands situated in the Mozambique Channel off the southeast coast of Africa. The economy, which is largely agricultural, suffered from severe drought in 1977. The country's austerity budget was supplemented by foreign loans and grants from Arab states. All financial aid from France was terminated in 1975 when the Comoros made a unilateral declaration of independence. Almost all industries were nationalized by the new Government, including the largest oil distributor, Royal Dutch/Shell. Petroleum products were supplied largely by Madagascar. The country's primary trading partners were Madgascar, Tanzania, Kuwait, and Saudi Arabia.

Digitized by Google

CONGO[11]

The loss of the potash industry and a decline in the production of other mineral commodities reduced the contribution of the Congo's mining sector to the 1977 GDP of $720 million.[12] Petroleum continued to be the major mineral revenue earner and accounted for 75% of export revenue. The Congo also produced copper, lead, and zinc concentrates and small amounts of gold, cement, and natural gas. Owing to the deterioration in the country's financial situation, the 3-year development plan (1975-77) was abandoned. The balance-of-trade deficit increased to $53 million in 1977. At yearend, the Government introduced an interim 2-year (1979-80) budget of $93 million while a comprehensive 5-year plan (1980-84) was being developed.

Production of potash at the Holle mine was curtailed in June 1977 owing to severe flooding after the rupture of the overlying dolomite aquifer. Production in 1977 was approximately 136,000 tons of K_2O compared with 256,521 tons of K_2O in 1976. The Holle mine, located 45 kilometers northeast of Pointe Noire, was operated by Compagnie des Potasses du Congo (CPC). Reserves were estimated at several billion tons of potash. However, technical difficulties at Holle had kept output well below anticipated levels.

At the time of the flooding of the Holle mine, investigations were being carried out regarding the exploitation of carnallite deposits in the vicinity. It had been determined that exploitation of the sylvinite deposits was becoming increasingly unprofitable owing to adverse geological factors. At yearend 1977, CPC was liquidated and there were no immediate plans to rehabilitate the potash operation. Interests in CPC were held by the Government (15%), Entreprise Minière et Chimique (36.125%), Bureau de Recherches Géologiques et Minières (BRGM) (36.125%), and Essence et Lubrificants de France-Entreprise de Recherches et d'Activités Pétrolières (Elf-Erap) (12.75%). Prior to the liquidation of the company, the French partners had been negotiating a withdrawal of shares in the potash mine.

Petroleum production in the Congo declined from 2 million tons in 1976 to 1.8 million tons in 1977. Oil was produced by Elf-Congo, a subsidiary of Elf-Erap, and Azienda Generale Italiani Petroli S.p.A. (Agip), a subsidiary of Italy's Ente Nazionale Idrocarburi (ENI). Approximately 98% of production was from the Emeraude field, owned 65% by Agip and 35% by Elf-Congo. Although it was originally expected to reach a production level of 100,000 barrels per day, the Emeraude field averaged 34,000 barrrels per day in 1977. The smaller Pointe Indienne field averaged 200 barrels per day.

The new Loango field, owned 65% by Agip and 35% by Elf-Congo, began production in September 1977. During the year, Agip sought to raise a $25 million, 6-year loan to finance development of the Loango field. Two producing wells were drilled, and plans called for an additional 40 wells to be completed. Output was expected to average 40,000 barrels per day upon completion. A 97-kilometer, 18-inch pipeline was to link the field with the Djeno terminal, which also handled Emeraude crude.

The Government actively encouraged oil companies to engage in offshore petroleum exploration. The SEAGAP consortium prepared to drill a wildcat well offshore in waters more than 4,000 feet deep. Members of the group, which held an 8,000-square-kilometer permit area, were Getty Oil Co., Agip, Phillips Petroleum Co., and Hispanoil. The state-owned Hydrocongo held a 32% interest in the venture and an option to increase its share to 49% if there was a commercial discovery.

The Congo's first petroleum refinery, under construction at Pointe Noire, was to begin production in 1978. Commissioning of the refinery was delayed owing to technical problems, and the Government was seeking additional financing to make the plant operable. Construction of the 1-million-ton-per-year refinery was by the Belgian consortium Sybetra. The refinery was to be owned and operated by Hydrocongo and supplied by Emeraude crude.

Marketed natural gas production was approximately 310 million cubic feet in 1977. Reserves of natural gas at the Pointe Indienne field were estimated at 12 billion cubic feet. Output was sold to CPC for use in the Holle potash plant.

Production of copper, lead, and zinc concentrates by Société Minière de M'Passa continued to decline owing to the depletion of higher grade reserves. In 1977, copper concentrate production was approximately 13,000 tons. Base metal production was to be greatly augmented by the mining of copper, lead, and zinc ores by Société Na-

Digitized by Google

tionale des Mines de M'Fouati (SONAMIF) in the Boko Songo area. Reserves were estimated at 300,000 tons averaging 28% lead, 9% zinc, and 4% copper. Annual production of 30,000 tons of lead concentrate and 4,000 tons of copper concentrate was to begin in 1978.

Société Nationale des Mines de Sounda-Kakamoeka (SONAMIS), a joint venture of the Congo and the Soviet Union, continued development of gold deposits in the Kouilou area north of Pointe Noire. The alluvial gold deposits were estimated to contain reserves of 4,500 kilograms.

Production of cement at Cimenterie Domaniale de Loutété (CIDOULOU) plant was reported at 50,000 tons in 1977. CIDOULOU planned to complete expansion of the plant from 60,000 tons per year to 100,000 tons per year by 1978. A second cement plant was to be built at Fatima, near Bangui, with an annual capacity of 120,000 tons per year.

Table 3.—Congo: Foreign trade in mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations and sources, 1976
EXPORTS			
Copper ore and concentrate	3,274	704	West Germany 670.
Diamond: Gem, not set or strung value, thousands	$1,649	$1,270	Netherlands $726; Belgium-Luxembourg $496.
Fertilizer materials: Potassic	408,159	400,379	France 90,059; South Africa 86,150; Brazil 43,890.
Lead ore and concentrate	11,501	11,404	All to France.
Petroleum:			
Crude thousand 42-gallon barrels	13,617	13,303	United States 6,692; Italy 3,256; Spain 1,937.
Refinery products:			
Kerosine 42-gallon barrels	58,668	73,346	NA.
Zinc ore and concentrate	--	3	All to France.
IMPORTS			
Aluminum, unwrought and semimanufactures	58	70	France 48.
Cement	28,110	23,905	Zaire 22,904.
Clays and clay products: Nonrefractory	933	1,119	France 549; Italy 252; West Germany 244.
Crude nonmetallic minerals, n.e.s.	1,331	607	NA.
Gas, hydrocarbon	21,912	20,567	Gabon 14,059; France 5,800.
Iron and steel semimanufactures:			
Iron and steel shapes	6,165	4,280	France 3,818.
Universals, plates, sheets	3,042	3,395	France 1,512; Japan 1,423; People's Republic of China 267.
Railway rails, etc.	2,003	5,688	All from France.
Iron and steel wire	484	177	France 156.
Iron and steel tubes, pipes, etc	1,977	806	France 528; West Germany 91.
Nonferrous metals, n.e.s. value, thousands	$132	$140	NA.
Petroleum refinery products:			
Gasoline 42-gallon barrels	250,861	272,731	Gabon 234,668; Algeria 14,561.
Kerosine do.	187,907	308,249	Gabon 227,959; Netherlands Antilles 56,800.
Distillate fuel oil do.	201,636	104,060	Gabon 90,102.
Residual fuel oil do.	--	22,458	All from Gabon.
Lubricants do.	15,302	12,712	Netherlands 6,244; Ivory Coast 3,192; France 2,485.
Nonchemical coal and petroleum wastes	--	539	NA.

NA Not available.

DJIBOUTI[13]

No mineral exploitation has yet been initiated in Djibouti, which received its independence from France on June 27, 1977. The economic income of Djibouti, formerly the French Territory of Afars and Issas, was based on entrepôt trade through the port of Djibouti and along the Chemin de Fer Franco-Ethiopian (CFE) railroad. Customs duties were the major contributor to the 1977 gross national product (GNP) of approximately $180 million.[14] The country continued to have a severe balance-of-trade deficit, estimated at $48 million in 1977, and suffered from an unemployment rate of about 90%. Subsidies from France and Saudi Arabia sustained the economy in 1977, and Djibouti sought further aid from other Arab states.

The CFE railroad, which links Djibouti and Addis Ababa, Ethiopia, was closed

Digitized by Google

in June 1977 owing to civil conflict in Ethiopia. Trade along the 780-kilometer railroad consisted primarily of Ethiopian imports and exports. Traffic at the port of Djibouti similarly decreased. In 1977, a British firm was employed to conduct a feasibility study for expansion and modernization of the port. A new 247-kilometer road establishing a connecting link between Djibouti and Addis Ababa was opened in June 1977.

Potential mineral projects in Djibouti included extraction of gypsum and salt from Lake Asal and the construction of a cement plant at Mount Arrey based on local limestone deposits. Recent legislation was aimed at encouraging foreign investment in mineral and petroleum exploration and exploitation through providing various tax exemptions and economic incentives. Evaluation of geothermal resources in the area of Lake Asal was conducted with technical and financial assistance from BRGM of France.

EQUATORIAL GUINEA[15]

Information about the economy and industry of Equatorial Guinea has not been available since March 1976. There were no reported changes in the oil concessions around Isla de Macias Nguema Biyogo (formerly Fernando Po) or off the coast of the mainland Province of Rio Muni, nor were there any indications that exploration for oil had been resumed. Mineral products for use as local building materials presumably included clay, sand, and stone, but investigations of previously recorded indications of phosphate, iron ore, and radioactive materials were not reported during 1977.

ETHIOPIA[16]

The mineral sector of Ethiopia contributed less than 1% to the estimated 1977 GNP of $2.9 billion.[17] The manufacture of cement and the refining of imported crude oil were the major mineral activities. Ethiopia also produced small amounts of gold, platinum, and salt. The economy continued to suffer from an external debt estimated at $400 million and a balance-of-trade deficit of $160 million in 1977. Foreign trade in minerals was disrupted by the irregularity of transport on the Addis Ababa-Djibouti railroad caused by civil conflict.

Although the country's mineral potential was believed to be excellent, it remained relatively undeveloped. Exploration and production of most minerals were nationalized by the Ethiopian Provisional Military Government (EPMG) in 1975. Mineral prospecting was minimal in 1977. The United Nations was to begin a $2 million study of geothermal resources for power development in 1978. During the year, Ethiopia participated in establishing the East Africa Minerals Development Center, intended to advise member states on planning and implementing geophysical and geological surveying programs.

Ethiopia's sole petroleum refinery at Assab in Eritrea Province produced 4.6 million barrels of petroleum products in 1977. The refinery, which had a capacity of 14,000 barrels per day of petroleum products, was owned and operated by the Ethiopian Petroleum Share Co. All crude oil was imported from Saudi Arabia. Petroleum products were marketed domestically by Mobil Oil East Africa Ltd., Shell Oil, Agip, and Total Oil; the Government held a 51% interest in each of the petroleum distributing companies. Owing to political uncertainty in Ethiopia, all petroleum exploration activity ceased in 1976.

Cement production was approximately 150,000 tons in 1977. The output of Ethiopia's two cement plants was based on local limestone and gypsum deposits. The Eritrea Cement Co. plant at Massawa had a rated capacity of 70,000 tons per year. The Addis Ababa cement plant, operated by the Ethiopian Cement Corp., had an 80,000-ton-per-year capacity.

Salt output from solar pans along the Red Sea was about 80,000 tons. The two major saltworks in Eritrea each had a rated capacity of 100,000 tons per year. Production by Societa Saline di Massawa and Société des Salines d'Assab was mostly for export.

In 1977, the Ethiopian Ministry of Mines, Energy, and Water Resources signed a tech-

Digitized by Google

nical agreement with the Soviet Union to modernize the Adola gold operation to expand production. Gold from the Adola alluvial deposits, situated in Sidamo Province in southern Ethiopia, was recovered by traditional panning. Output ranged between 7,000 ounces and 20,000 ounces per year. A small amount of platinum was produced at the Government mine at Yubdo in Wollega Province.

THE GAMBIA[18]

The Gambia, a small west African republic extending some 320 kilometers inland from the Atlantic coast and only 11 to 32 kilometers wide along the lower reaches of the Gambia River, had negligible mineral production in 1977. Heavy beach sand deposits in the Western Division and kaolin in the Upper River Division were the only known significant mineral deposits. Production of unreported amounts of clay, sand, stone, and gravel undoubtedly took place to supply local building requirements. Offshore petroleum exploration rights were held by Aracca Petroleum and by Chevron Overseas Petroleum Co.

The Gambian economy expanded markedly with the GDP reaching $116 million[19] in 1977, an increase of 22% compared with 1976. Exports increased 46% to nearly $50 million, while imports increased 8% to $80 million. The Gambia continued to import almost all of its requirements for cement, fertilizers, iron and steel products, and refined petroleum products.

GUINEA[20]

The mineral industry of Guinea continued to be an important contributor to the nation's GDP, which was $1.1 billion[21] in 1977. Bauxite and alumina were the principal mineral products, and exports of these products provided nearly 97% of the country's foreign exchange earnings.

Guinea is well endowed with natural resources. The country contains about one-third of the world's high-quality tropical bauxite, several billion tons of iron ore, a significant diamond reserve, alluvial gold, indications of offshore petroleum, and uranium prospects along the northern tier near the Mali border. Guinea is the source of the Niger, Senegal, and Gambia Rivers, giving the country an estimated hydroelectric potential of 7,200 megawatts. Only 24% of the nation's 7 million hectares of arable land was under cultivation in 1977.

Guinea produced an estimated 11 million tons of bauxite in 1977 and was the world's third largest bauxite producing country. Compagnie des Bauxites de Guinée (CBG), operator of the Sangaredi mine in the Boke concession area, had an output of over 7 million tons; Office des Bauxites de Kindia (OBK) produced more than 2 million tons from the Delebe deposits; and Société d'Economie Mixte Friguia, which mined bauxite for alumina production in Guinea, had an output of slightly less than 2 million tons.

CBG, owned by Halco Mining Inc. (51%) and the Government (49%), continued to expand output and planned to produce 9 million tons of bauxite per year beginning in 1979. CBG shipped high-grade bauxite from its plant and port at Kamsar primarily to members of Halco, a consortium of aluminum producers consisting of Aluminum Co. of America (Alcoa) (27%), Alcan Aluminum Ltd. (27%), Martin Marietta Aluminum Inc. (20%), Pechiney-Ugine-Kuhlmann (PUK) (10%), Vereinigte Aluminium-Werke (VAW) (10%), and Montedison S.p.A. (6%).

OBK, Government owned, exported ore primarily to the Soviet Union from loading facilities at Conakry. OBK initiated production in 1974 from the Delebe mine which was built with technical assistance and financing provided by the U.S.S.R. Reportedly 90% of the mine's output was contracted to the Soviet Union and the remaining 10% could be sold either on the world market or to the U.S.S.R.

Friguia, owned by Frialco Co. (51%) and the Guinean Government (49%), produced approximately 560,000 tons of alumina in its plant near Kimbo approximately 145 kilometers northeast of Conakry. Alumina was shipped from Conakry to the members of Frialco, another consortium consisting of Noranda Mines Ltd. (38.5%), PUK (36.5%), British Aluminium Ltd. (10%), Alusuisse (10%), and VAW (5%). Friguia was plan-

Digitized by Google

ning to expand the capacity of the Kimbo mine and alumina refinery to 4 million tons per year of bauxite and 1.2 million tons per year of alumina by 1983.

Société Guinea-Arabe d'Alumine et d'Aluminium (Alugui) planned to develop the Ayekoye concession in the Boke Region approximately 20 kilometers northwest of the Sangaredi mine. Alusuisse was to conduct detailed exploration, complete feasibility studies, and produce preliminary designs for the project, which was to produce 9 million tons per year of bauxite, 2 million tons per year of alumina, and eventually 150,000 tons per year of primary aluminum. The aluminum smelter was to be supplied with power from proposed hydroelectric powerplants that were to be constructed on the Konkoure River with a capacity of 600 megawatts. Reserves at the Ayekoye concession were estimated at 500 million tons of ore with an alumina content of 51.6% to 59.6%. Alusuisse was to report its findings in mid-1978 to Alugui which was comprised of the Governments of Egypt, Guinea, Kuwait, Libya, Saudi Arabia, and the United Arab Emirates.

Two other large bauxite deposits in Guinea have been studied in detail. The Government and Alusuisse venture, Société Minière et du Participations Guinée-Alusuisse (SOMIGA), planned to develop the Tougué deposits, estimated to contain over 2 billion tons of ore with an average alumina content of 44%. An eventual production level of 8 million tons per year of bauxite and 1.2 million tons per year of alumina was slated for completion by the mid-1980's. Société des Bauxites de Dabola, a joint venture composed of Guinea, Algeria, Nigeria, and Yugoslavia, planned to develop the 450-million-ton Dabola deposits and produce 1 million tons per year of alumina. Bauxite production level was to be determined later by the needs of the participants.

In 1973, Mifergui-Nimba, a consortium of foreign, private, and governmental interests (50%) with the Guinean Government (50%), was set up to develop the high-grade iron ore deposits at Mount Nimba near the Liberian border in southeast Guinea. During 1977, Kaiser Engineers was conducting a feasibility study, which was to be completed in mid-1978. The Mount Nimba ore body consists of two high-grade deposits, at Pierré-Richard and Sempété, each with over 300 million tons of friable hematitic ore containing 65% iron and generally less than 2% magnetite. Development of the Nimba deposits was to be accomplished by 1985, to produce 15 million tons of iron ore per year for 40 years.

In October, Compagnie Générale des Matières Nucleaires (COGEMA) of France began a program of uranium exploration in the Labe Region of northern Guinea. Reportedly, firms from Japan and Italy expressed interest in joining the French uranium exploration effort.

Guinea planned to construct a 200,000-ton-per-year cement clinker grinding plant near Conakry to supply most of the nation's cement demand. The Government was also considering building a 200,000-ton-per-year cement plant either at Kindia 100 kilometers northeast of Conakry or at Siguiri on the Niger River near the Mali border.

International Diamond Corp. Ltd. of the United Kingdom was to begin alluvial diamond mining near Kissidougou in 1978. Diamond resources in southeast Guinea have been estimated to exceed 300 million carats with two-thirds being of gem quality.

In 1977, Société de Guinée des Pétroles (SOGUIP) drilled a single exploration well in its 44,000-square-kilometer offshore concession. The BA-1, a dry hole, was abandoned at 3,350 meters.

GUINEA BISSAU[22]

Guinea Bissau, a small west African nation of 800,000 inhabitants and a GDP of $112 million,[23] had no reported mineral production in 1977. Small amounts of clays, sand, stone, gravel, and marine salt were produced for local consumption. Resources of bauxite, gold, iron ore, phosphate rock, titanium sands, and zircon have been reported but remained undeveloped in 1977. The country neither produced nor refined crude petroleum and was dependent on imports for its liquid hydrocarbon requirements. No petroleum exploration activity took place during 1977, although Agip applied for an offshore exploration license.

The Government established the National Company for Oil and Mining Research and Exploration (PETROMINAS) in March. The company was created with the objective of promoting the exploration and research

Digitized by Google

of mineral and petroleum resources throughout the country and abroad. The company received administrative and fiscal autonomy but remained under the tutelage of the State Commission of Energy, Industry, and Natural Resources.

During 1977, teams from the Soviet Union began more intensive studies of the bauxite deposits in the Boe Region of west-central Guinea Bissau. During 1975, Soviet investigators had completed 48 test borings in the area and estimated that approximately 500 million tons of commercial-quality bauxite was located in Guinea Bissau.

IVORY COAST[24]

No mineral production was reported in the Ivory Coast during the year. A large deposit of low-grade iron ore has been found near Main, but plans to exploit it were postponed indefinitely owing to low demand and consequent low prices in the international markets. However, oil exploration paid off during the year. After more exploratory work on their permit H-1, Exxon-Shell decided to bring the deposit, found in 1974, into production. The oil reservoir, located 15 kilometers off the coast near Grand Bassum, reportedly contained 70 million barrels, a volume that could be increased if water injection proves feasible. Production was expected to begin in 1980 and to reach a peak of 8,000 barrels per day by 1982 or 1983. After about a year of peak production, output is expected to decrease. A drilling production platform designed for 10,000 barrels per day of oil and 5 million cubic feet per day of gas was ordered from Fluor Corp. Oil was to flow by submarine and overland pipeline to the Abidjan refinery.

Per capita GDP increased to approximately $700[25] in 1977 from $623 in 1976, although the country had minimal mineral production during this period.

In June 1977, significant diamond production ceased when Société Waston stopped all operations at the diamond deposit in the Séquéla Region, which had produced since 1971. Total production from the Babi diamond deposit, which was also terminated, was 17,800 carats, involving the treatment of 128,000 cubic meters of gravel. Diamond exports totaled 27,000 carats.

Société pour le Developpement Minière de la Cote d'Ivoire (Sodemi), the Ivorian State prospecting company, examined lateritic nickel mineralization in the Biankoumu zone and copper-nickel sulfides and radioactive minerals in the northern regions of the country. Discussion between the Sodemi representatives and the Canadian company Falconbridge Nickel Mines Ltd., concerning the possible development of the known lateritic deposits, continued during the year. Also Sodemi's cooperation continued with the BRGM on prospecting for iron ore and manganese and on beach sand studies. No results of significance were reported by the end of 1977.

The iron ore deposit found in the Mount Klahoyo Region of the country, about 600 kilometers northwest of Abidjan, remained dormant. A meeting was held during the year to further assess the exploration effort, the shape of the ore body, reserves, and exploitation techniques. However, it was decided that new partners should be invited to participate in feasibility studies and the large investment needed for beneficiation of this deposit.

Gold deposits at Ity, 60 kilometers west of Main, were not brought to the beneficiation stage. The consortium established for this purpose continued complementary exploration to prove more ore reserves and to perform more research work on the beneficiation of the ore.

LESOTHO[26]

The 1977 mineral industry of Lesotho consisted almost exclusively of diamond production. A small amount of crushed stone was produced for domestic consumption. Diamond output of 42,090 carats was valued at $6.4 million,[27] compared with 5,016 carats at $0.4 million in 1976.

Lesotho's petroleum needs were satisfied by imports from the Republic of South Africa. Petroleum exploration in Lesotho was conducted on a limited basis in 1977. Exploration and feasibility studies were undertaken to ascertain the commercial viability of Lesotho's coal deposits.

Digitized by Google

The Letseng-la-Terai diamond mine reached its planned production level in September 1977 by treating 680,000 tons of ore and recovering 22,688 carats of diamond. Two kimberlite pipes were identified as diamondiferous. Both pipes penetrate 1.5 kilometers vertically into Karroo Stormberg basaltic lavas. The hard blue kimberlite of the main pipe was overlain by 1 meter of altered basalt followed by basaltic gravel. The circular open pit mine has a standard bench height of 5 meters with plans for an ultimate practical depth of the main pipe of 135 meters with an average backslope of 40°. The waste-to-ore ratio was calculated at 1.2:1.0. The mine has a minimum life of 8 years.

The water supply was obtained through a pipeline from the Khakelu River, while electricity was provided by a 88,000-volt line from the Lesotho Electricity Corp. power network. The Letseng mine employed 760 people, including 682 Lesotho nationals. De Beers Lesotho Mining Co. (Pty.) Ltd. has begun an extensive training program for Lesotho nationals.

The Letseng mine was jointly owned by the Government (25%) and De Beers Consolidated Mines Ltd. (75%). Diamond sales through the Central Selling Organization in London was to be conducted by the Diamond Corp. Lesotho (Pty.), a Lesotho firm. Under the agreement with De Beers, when capital costs have been recovered, 62.5% of the profits are to be realized by the Government, rising later to a maximum of 72%.

MALAWI[28]

The mineral industry of Malawi contributed very little to the nation's GNP of $821.6 million[29] in 1977. The major mineral product of Malawi continued to be marble from the Changlume quarry near Zomba which was used in cement manufacture. Small quantities of unreported dolomite, clays, sand, stone, and gravel were produced for domestic consumption, and Gemstones Ltd. continued to export agate, aquamarine, and smoky quartz.

The Malawi Mineral Development Section of the Chamber of Mines of South Africa completed field investigations on alluvial apatite deposits in the southern region and carried out geochemical sampling programs for copper and nickel on ultrabasic intrusives in the southern and central regions.

British Gypsum Ltd. (BGL) was granted a mining lease covering the Kapirikamodzi vermiculite deposit and exported a trial shipment of 90 tons to the United Kingdom. BGL continued to hold exclusive prospecting rights covering the Kapiridimba kyanite mineralization area.

Agip was granted an exclusive license to explore for radioactive materials in three blocks of country underlain by Karroo deposits. Agip carried out airborne and follow-up geophysical surveys and exported samples for detailed analysis.

Gemstones Ltd. concentrated investigations on an emerald prospect in the Mzimba District. The Geological Survey Department carried out a reconnaissance survey of eight pegmatites in the Mzimba District which contained promising concentrations of emerald, aquamarine in association with green and black tourmaline, and rose and amethystine quartz.

During 1977, Malawi had no significant mineral exports and relied heavily on imports to supply its needs for metals, fertilizers, and fuels. The country had its first positive materials trade balance in 1977 because of the increased value of agricultural exports such as tea, tobacco, coffee, and cocoa.

MALI[30]

Mineral production in Mali for calendar year 1977 was valued at approximately $5.6 million[31] and thus formed a minor sector of the nation's GNP of $645 million at current prices. Reported mineral production included gold ($128,000), salt ($115,000), limestone ($96,000), marble ($12,000), granite ($140,000), and cement ($5.1 million).[32] In 1977, manufacturing, including gold and silver handicrafts, accounted for 14% of the GNP, an increase of 3% over the 1976 contribution. The Malian economy in general continued to show modest improvement and had a real GNP growth of 7% (based on

Digitized by Google

1969 constant prices).[33]

While virtually all large enterprises were owned by the Malian State, with the few remaining having mixed ownership, the investment climate for foreign firms was considered favorable. The need to attract foreign capital prompted the military government to liberalize the investment code with foreign concerns exempted from taxes for 5 years. The Government was also stressing geological, mining, and petroleum exploration. Mali was expected to abide by its investment code which requires a minimum Government ownership of 10% to 50%. A lack of adequate infrastructure was still a constricting factor for development.

Total exports were valued at $125.5 million, while total imports were valued at $170.2 million, resulting in a net trade deficit. However, the trade deficit decreased by 17% compared with the 1976 deficit and by 53% compared with the 1975 deficit. France was Mali's leading supplier, including industrial and transportation equipment, cast iron, iron and steel items, and chemical products. Over half of all supplies are imported through Dakar, and approximately 48% comes through Abidjan. Most fuel was imported by rail. Fertilizers and cement make up most of the tonnage hauled by road. The Malian Railway Administration purchased new tank cars for increased fuel transportation by rail. Of total imports for 1977, 31% was equipment, 16% was chemicals and pharmaceuticals, 14% was building materials, and 10% was food. Fuel imports were up 13% compared with 1976. Agricultural products formed most of Mali's exports.

The country was almost entirely dependent on thermal power, but hydroelectric resources were expected to play an increasing role by 1982 with completion of the Selingue Dam on the Sankarani River. This new dam, which was begun on November 19, 1976, was to provide about 45 million additional kilowatt-hours; the current production is 76 million kilowatt-hours. The initial cost was estimated at $110 million, and the work was expected to take about 5 years. In 1977, loans for the dam construction were secured from the African Development Bank (ADB), France, and Qatar. The cost of building the 130-kilometer road between Bamako and Selingue was included.

Foreign aid amounted to $227 million in 1977. In addition, credits granted to the Government by the Central Bank in all forms amounted to $197 million at the end of 1977. Among foreign loans[34] made during the year was $4.4 million from the Netherlands for the construction of the 306-kilometer road from Ansongo to Aderambouke. The World Bank, France, and the Canadian International Development Agency (CIDA) contributed funds for modernization of the Regie des Chemins de Fer du Mali (RCFM) and more efficient rail transportation. The United Nations financed two small brick factories at Bamako (12,000 tons per year) and at Segou (8,000 tons per year). The Malian Brick Works, a public enterprise, completed both brick production units in 1977.

Among the mineral industry projects under study were a glassworks, which would utilize clay from Faguibine Lake ($3.6 million); fertilizer plants at Koulikoro and Segou, which would use imported ammonia (to cost $19 million) and phosphates derived from the Bourem phosphate deposit; and expansion of the Malian Cement Co. plant at Diamou near Kayes. The cement plant capacity was to be increased to 100,000 tons per year and would involve financing of about $53 million to be furnished by Saudi Arabia, Japan, and the Federal Republic of Germany. Long-range plans also envisioned the production of aluminum through processing of the Manantali bauxite, and a small electric iron and steel plant supplied by the iron ore of Niono and other western Mali deposits. A second cement plant at Gangouteri, about 40 kilometers from Diamou, was also being considered.

Mineral development in western Mali depended upon progress made in Senegal River Development Organization (OMVS) programs. Studies reporting on the Manantali Dam and its hydroelectric plant, on the construction of the Diama Dam, and on making the Senegal River navigable were passed through the first-reading stage by the OMVS High Commission Council of Ministers. The Manantali Dam, to be located on the Bafing River, was expected to cost about $150 million and would not be ready for service before 1984. Exploitability of the deposits of the Kayes Region was also still under study; mineralization included bauxite, iron ore, and diamond.

Sizable deposits of bauxite, uranium, and iron in western Mali and copper, manganese, platinum, and phosphates in the Liptako-Gourma area were the objects of exploration and feasibility studies. The Government firm, Société Nationale de Recherches et d'Exploitation Minières (SONAREM) was assisted in prospecting operations in both areas by the Soviet Union

Digitized by Google

and the German Democratic Republic. French aid was both private and public and included financial as well as technical assistance from the French Aid and Cooperation (FAC) and BRGM. Detailed prospecting and feasibility studies were being done on the bauxite deposits of Balea and Sitaouma, located in proximity to the planned Manantali Dam site. PUK of France was studying exploitation of the Balea deposits. The FAC signed three new agreements in December 1977, including a loan of $380,000 to be spent on studies involving the iron ore deposits of the Bafing-Makana Rivers area; the Balea deposit, located near the Manantali Dam site, is in this area and is estimated to contain 130 million tons of hematite with an iron content of 40% to 65%. The entire basin in which the deposit was located is estimated to contain as much as 500 million tons of iron ore. On the Malian side of the Faleme River (opposite Senegal) another high-grade iron ore deposit was also being studied with financial and technical assistance from the United Nations and France.

BRGM was assisting the Government of Mali in drawing up a minerals plan, while CIDA was assisting with a geophysical survey of the Liptako-Gourma area. The Liptako-Gourma Authority (Mali, Upper Volta, Niger, and Togo) was coordinating studies aimed at a mineral resources inventory of the area. The main prospects under consideration were the manganese ores of Ansongo (3.3 million tons of 40% manganese) and the phosphates of the Bourem area (20 to 25 million tons of 27% P_2O_5). The investment required for developing the Bourem phosphates was estimated at $3.8 million, including facilities for ore extraction at Tamaguelleit in the Tilemsi Valley; transportation of ore to Bourem on the Niger River; and concentration, crushing, and bagging of the product.

The Malian Bureau of Mines and Geology granted uranium exploration concessions to COGEMA (France), BRGM, and a Japanese-financed company, Power Reactor and Nuclear Fuel Development Corp. (PNC). Several U.S. companies were also reported as interested in uranium prospecting. COGEMA held two concessions, located between Kayes and the Senegal border on the west and Sikasso and Upper Volta on the east. BRGM had two areas, one located near the Senegal and Guinea borders adjacent to the COGEMA areas, and the other just south of the PNC area. PNC's concessions were in northeastern Mali near the Algeria and Niger borders. Deposits similar to those of the Hoggar massif in Algeria and the sandstone of Niger were being sought. From initial surveys in the Kidal, Tessalit, and the Tilemsi Valley, PNC estimated the country to have a high potential for discovery of minable uranium deposits. Kenting Earth Sciences Ltd., a Canadian company, had done initial airborne surveys for PNC. On October 5, 1977, PNC sent a 35-man exploration team to conduct the third airborne survey, make geological surveys, and do drilling tests over four selected areas, Ibelbel, Barakoye, Kidal, and Tessalit. About $3.7 million was to be spent on the project. The initial aerial survey in the Kidal concession showed strong radioactivity at seven different locations; of the seven, three were determined as promising from the followup drilling and geological surveys.[35]

A total of 90 Soviet miners and geologists were working at the gold mine in Kalana along with 500 Malian engineers and workers. The Kalana mine was expected to be fully operational by 1980, but would be supplying 400 kilograms of gold per year by 1979. This production was expected to reach 1,790 kilograms per year after 1980. Gold production from various sources in Mali was 29 kilograms in 1977. Prospecting also continued at Kodieran. This gold deposit, located 6 kilometers from Kalana, was expected to be exploited by the end of the current 5-year plan. Cost to develop this deposit was estimated at $6 million. Diamond prospecting also continued in the Kenieba Region.

Several petroleum companies were considering renewal of petroleum prospecting. The French company, Elf-Aquitaine, in particular was requesting exploration concessions near Gao.

MAURITIUS[36]

The 1977 mineral production contributed $5 million[37] to the GNP, estimated at $666 million at current prices. Minerals produced included salt (6,000 tons) valued at $383,000, lime (7,500 tons) valued at $638,000, and basalt (1,574,000 tons) valued at $4 million. All commodities produced increased in amount and value compared with 1976 levels; basalt production was three times higher than in 1976. Mauritius relied upon foreign trade for about 60% of the GNP but imported most of the raw material used for its export-oriented industries. The value of imports for 1977 rose 22% to $470.7 million, whereas the value of exports rose only by 15% to $325.5 million. About 7,234 barrels of crude oil was imported. Total refined petroleum product imports were valued at $47 million for 1977. Mauritius also imports cement and iron and steel products.

No additional exploration drilling was planned for the immediate future by Caltex Oil Mauritius, which had been carrying out petroleum exploration off the coast of Mauritius. Caltex had drilled two exploratory wells, but no oil was found. A new maritime zones bill was passed in 1977 which established a 200-mile economic resource zone and extended the territorial sea to 12 miles. Exploration and exploitation of the continental shelf were also covered by the new law.

NIGER[38]

Uranium, the major foreign exchange earner and an increasingly important budget source, has firmly established itself as the key to Niger's economic future. Its share of export earnings reached 74% in 1977, rising from some $57 million[39] in 1973 to $148 million in 1977. The estimated GDP was $592 million in 1977, compared with $538 million the previous year. Per capita GDP reached a new high of $119 in 1977 compared with $112 in 1976.

As the Government approached completion of its first development plan (1976-78), programs were underway for a 5-year followup plan (1979-83), which was to emphasize rural development, improvements in health and education services, improved production in the agricultural sector, and industrial expansion. The most acute problem to the broadening economic development of Niger, a landlocked country, remained its dependence on neighboring countries for supplies of petroleum and other raw material. Since railroad links with neighbors seemed still a year away, extensive highway improvements were in the planning stages and all-purpose haulers were given first priority. Foreign investment continued to be encouraged. The investment code, in effect since March 1974, provides for two major grace periods of tax relief and tariff protection (if necessary), allocated according to levels of investment in selected fields (energy production, mineral exploration, agriculture, fertilizer industries, and forestry). Government participation in commercial ventures, while common in Niger, was not required by law. As a member of the West African Monetary Union, Niger shared a common currency with other members. The currency received its stability from its full convertibility with French francs as guaranteed by the French Government. This backing enabled Niger to operate a liberal system of payments and transfers; for example, profits after taxes may be fully repatriated in international transactions.

Uranium production, begun in 1971 in Niger's desolate Air Region, was 1,440 tons in 1977. Estimated reserves exceeded 100,000 tons of uranium, and 16 foreign companies from 9 different countries were participating in exploitation or exploration in 1977. The long-awaited opening of Niger's second uranium mine, Akouta, did not materialize in 1977, but the mine was scheduled to open in the first quarter of 1978. Akouta, the first deep underground mine in Niger, operated by the consortium Compagnie Minière d'Akonta (COMINAK), with Niger, French, Japanese, and Spanish partners, was to produce 200 tons in 1978 and 2,000 tons annually by 1981. Niger's only other uranium mine, Arlit, operated by Société des Mines de l'Air (SOMAIR), produced 1,440 tons in 1977, while employing 600 workers and 90 engineers. A third find

Digitized by Google

at Imouraren, which contained greater reserves than any uranium deposit in Niger, was in its final feasibility study stage at the end of 1977. The operators of this deposit, the French Atomic Energy Commission and Niger Government, reportedly were to begin actual mining in 1979, with production of a marketable yellow cake by 1983. All of the companies active in mining, particularly uranium mining in Niger, and those interested in obtaining mining permits were asked by the Niger Government to help finance the $100 million Tabora-Arlit uranium highway. This road would link the isolated north to the commerce-oriented south. All 1977 negotiations indicated that the Government strongly viewed financial support for the highway as a prerequisite to participation in the country's uranium development.

The construction of Niger's new $125 million powerplant, a mixed enterprise of Société Nigerienne du Charbon (SONICHAR), was almost completed at yearend. The Sonichar complex will eventually produce 250 million kilowatt-hours annually, utilizing as feed stock coal from the new deposit near Air. Reportedly 4.5 million tons of coal was already blocked in this deposit.

During the year, Société Minière du Niger (SMN) operated two small tin mines, mostly placer, with 105 tons of total production. Phosphate deposits found to the north of Tahoua remained dormant during the year, because of low-grade and high-beneficiation cost.

RÉUNION[40]

The production of cement was the primary mineral activity in Réunion, an island in the Indian Ocean approximately 640 kilometers east of Madagascar. The clinker-grinding plant operated by Ciments de Bourbon S.A. had an annual capacity of 200,000 tons. It was located in Le Port, southwest of the capital, Saint Denis. BRGM (France) continued ground water surveys and geological mapping of Réunion, which was an overseas territory of France. The country's major development projects, financed largely by France, consisted of infrastructure improvements including road construction, electrification, and port expansion at Pointe des Galets.

RWANDA[41]

Both the quantity and value of Rwanda's mineral production increased during 1977, and mineral exports accounted for more than 20% of the country's foreign exchange. Cassiterite (tin ore) was Rwanda's most important mineral product, and ranked second after coffee in value as an export commodity. Production of tin and tungsten minerals increased only marginally in 1977, but production of columbite-tantalite increased 42% from 45.4 tons in 1976 to 64.4 tons in 1977, and gold recovery increased 115% from 936 to 1,814 troy ounces during the same period.

Most of Rwanda's mineral industry was controlled by the Société MiniÈre du Rwanda (SOMIRWA), managed and 51% owned by Compagnie Géologique et Minière des Ingénieurs et Industriels Belges (Gèomines), and 49% owned by the Rwandan Government. SOMIRWA's output was marketed by Société Générale des Mines (SGM) of Belgium. In December 1977 the Rwandan Government confirmed that SOMIRWA had received a 15-year loan of $3.6 million from the European Investment Bank for construction of a smelting plant at Kigali to produce tin metal and tantaliferous slag from Rwandan ores. Interest on the loan was scheduled at 2% for the first 4 years and 6% for the remaining 11 years.

Rwanda's chief export route through Uganda to the Kenyan port of Mombasa on the Indian Ocean continued to carry most of the imported supplies, including motor fuel, required for the mining industry. Delays in delivery of goods on this 1,800-kilometer route, aggravated by complications and weight restrictions at two Ugandan frontier crossings, caused intermittent fuel shortages in Rwanda. Air charter firms transported one-third of Rwanda's coffee exports from Kigali to Mombasa and returned with high-cost or urgently needed imports, in-

Digitized by Google

cluding cement, at discount rates when extra space was available. All of Rwanda's wolframite and some of its cassiterite were exported to Brussels by air. The road from Kigali to the Rusumo Falls bridge across the Kagera River at the Tanzanian border was in good condition, but its connection to the Tanzanian railroad at Isaka was virtually impassable for trucks. Reconstruction continued on the Rwandan portion of an alternative export route through Bujumbura, the Burundian port on Lake Tanganyika, which involves lake steamer to Kigoma followed by rail across Tanzania to Dar es Salaam.

The Economic Community of the Great Lakes Countries (CEPGL) continued to investigate the development of hydroelectric potential for the mutual benefit of Rwanda, Burundi, and Zaire, with financial assistance from the Banque Arabe de Developpement (BADEA). The European Development Bank also provided assistance for a joint Zaire-Rwanda project for increased recovery of methane gas from Lake Kivu. Methane from the lake continued to be used as the source of heat and power at Brasirwa, the state-owned brewery.

On August 24, 1977, the Rwandan, Burundian, and Tanzanian heads of state established an Organization for Improvement and Development of the Kagera River Basin, in collaboration with the UNDP. One objective was to increase mining activities in an area of 67,000 square kilometers, including eastern Rwanda and adjacent parts of Burundi, Tanzania, and Uganda.

SAO TOMÉ E PRINCIPE[42]

The Democratic Republic of São Tomé and Principe, with a total area of less than 1,000 square kilometers and fewer than 80,000 inhabitants, became Africa's smallest nation in July 1975. Portuguese continued as the official language of the two islands, located 400 and 250 kilometers, respectively, southwest of the Isle de Macias Ngnema Biyogo (formerly Fernado Po) in the Gulf of Guinea off Africa's Atlantic coast. The country's preindependence GNP was estimated at $19.4 million, and its 1976 export and import trade was reported at $6.5 million and $6.9 million, respectively. A new monetary unit, the dobra, replaced the escudo on September 8, 1977, at the rate of US$1.00=38.3 dobras. Agriculture and fishing were the principal industries, but the traditonal manufacture of bricks and tiles from local clay and their use together with sand and stone for local buildings has presumably continued. Oil concessions reportedly were being renegotiated by Ball and Collins (Oil and Gas) Ltd. of London, but there was no record of recent exploratory work.

SENEGAL[43]

The growth rate of the Senegalese economy slackened in 1977 owing to depressed markets for its major export commodities, phosphates and ground nut oil. Total exports from Senegal's two phosphate operations, at Taiba and Thiès, were 1.6 million tons. The two operating companies, Compagnie Sénégalaise des Phosphates de Taiba (CSPTI) and the Société Sénégalaise des Phosphates de Thiès (SSPTH), were owned 50% by the Government and 50% by several European enterprises.

In mid-1977 the Senegalese Government announced a decision to postpone development of the Tobène phosphate deposit, with a reported 50 million tons of ore, until the reserves at the adjacent Taiba mine were exhausted. Beginning in 1978, Taiba's phosphate rock production was to be expanded to 2.1 million tons per year; at this level of production the deposit's life expectancy is 12 years. To implement this expansion, CSPTI purchased a $10 million[44] dragline from overseas, which was slated for delivery during 1978. It was also announced that the Iranian Government was to purchase 25% of CSPTI's stock, amounting to some $12 million. Recipients of Senegalese phosphate, in the order of tonnage volume, were France, the United Kingdom, the Federal Republic of Germany, and the Ivory Coast.

A new company, Industries Chimiques de Senegal (ICS), was organized in 1977 with the following share holders: The Senegalese

Digitized by Google

Government, 25%; Entreprise Minière et Chimiques, 25%; Société Industrielle d'Engrais Senegal, 15%; the Polish Chemical Export Agency, 10%; CSPTI, 10%; Rhône-Poulenc Thiès, 7.5%; and Eau et Électricité de l'Ouest Africaine, 7.5%. A total of $50 million was earmarked for investment in this project, which is expected to produce 500 tons per day of P_2O_5. Furthermore, this P_2O_5 will be used in the manufacture of triple superphosphate and diammonium and monammonium phosphate for export. The plant is expected to go onstream by mid-1981.

The feasibility studies that were started in mid-1976 to study utilization of iron ore mines in the eastern Kedougon-Saraya District continued during the year. Preliminary results indicated that remoteness of the iron ore deposit and inaccessibility were the major deterrents to the development of this commodity. The companies involved in the iron ore venture were Fried. Krupp GmbH (Federal Republic of Germany), 24%; BRGM (France) 24%; Kanematsu Gosho Ltd. (Japan), 24%; and the Senegalese Government, 28%.

Also, the results of the feasibility studies on the beach sand deposits on the east coast revealed that the percentage of titanium minerals was not high enough to warrant even a small-scale operation during the year. A Government company was organized to develop marble deposits in southeastern Senegal near Kedongar. The company was slated to produce about 10,000 tons of marble per year for export by 1982. In addition, the company will produce enough marble to satisfy domestic demand, thus eliminating imports from abroad. The company was conducting a market search in the international area, specifically Europe, for its varigated varieties of marble in 1977. Total production of cipoline marble was 5,000 cubic meters.

Oil and Gas.—About 100 million tons of heavy crude oil discovered at the 200-meter depth offshore, 60 kilometers west of the mouth of the Casamance River, remained untapped at yearend and the result of the feasibility study by a Venezuelan oil company to reevaluate this deposit was not yet available. Chevron Oil Co.'s exploration for oil 50 kilometers north of Dakar did not reveal a substantial finding; however, the company was planning further search in 1978.

The only petroleum refinery in Senegal, Société Africaine de Raffinage, located at M'Boa near Dakar, processed about 765,000 tons of crude oil during the year. Its capacity of 800,000 tons per year was sufficient to meet domestic needs and to export about 20% of the production to Mauritania and Mali.

SEYCHELLES ISLANDS[45]

The Government of Seychelles prepared and published its First National Development Plan (1977-81). The main objectives of the plan included economic viability, diversification of the economy, and greater Seychellois participation in the economy. Following the 1977 coup, a more socialist plan was promised. A census taken in 1977 indicated that the Seychelles Islands number approximately 100 in total, of which 40 are granitic and 60 coralline. The total population was nearly 62,000, and 4,244 persons were employed in mining and construction. The only mineral product mined was guano. In 1977, 5,277 tons of guano valued at $181,000[46] was produced.[47] Plans for development of other minerals included quarrying granite for export and petroleum exploration.

The Seychelle Islands were elected to membership in the Afro-Malagasy-Mauritian Common Organization (OCAM), an organization based on cultural and economic cooperation among French-speaking African countries. The Seychelles was the 11th member of the organization. Also during 1977, the Government of Seychelles promulgated a new law redefining the nation's territorial sea and exclusive economic zone, which was defined as the area beyond and adjacent to the territorial waters extending to a distance of 200 miles. The act also defined the continental shelf and enumerated Seychelles rights with respect to this area.

Petroleum exploration offshore the Seychelles Islands began with an agreement signed in 1977 by a group headed by Burmah Oil Seychelles (40%) as operator. Partners in the Burmah Oil group were Amoco Seychelles Petroleum (20%), Hematite Petroleum Seychelles (20%), and Norcen

Digitized by Google

International (20%). The exploration license covered 24 blocks over an area of 16,000 square kilometers. In addition, the Government concluded exploration agreements with Siebens Oil and Gas of Canada (16 blocks, totaling 10,956 square kilometers) and with Oxoco International of the United States (5 blocks, totaling 3,482 square kilometers). Terms provide for state participation of up to 50% in successful finds and fees totaling over $500,000 for the exploration rights. In addition to bonuses and annual rentals, a 12.5% royalty on oil produced and a petroleum income tax rate of 55% would be imposed.

SOMALIA[48]

The mineral industry of Somalia contributed minor value to the economy of the country in 1977. Production was limited to local building materials, marine salt, meerschaum, and small amounts of cassiterite. Neither production nor detailed trade figures were available. Marine salt was recovered by solar evaporation at Hafun in northeastern Somalia.

The Government's 5-year Development Plan (1974-78) continued toward fulfillment with foreign aid accounting for 67% of financing. The plan's $620 million[49] expenditure was primarily aimed at agricultural development, but 19% was destined for industrial development. The United States had resumed economic development aid to Somalia by yearend 1977 and was expected to submit to the U.S. Congress a proposal for an agricultural research and training program for Somalia in 1978. The United States had terminated development funds to Somalia in 1971. However, Somalia has received humanitarian aid and grants from the United States since 1971 largely because of an extended drought.

Geological surveys were conducted during 1977 by the UNDP, which in previous years had identified deposits of uranium, thorium, and yttrium. Uranium deposits, amenable to open pit mining, were found in the Bur Region of the Alio Ghelle area, 190 kilometers northwest of Mogadiscio. The carnotite reserves were estimated to exceed 5,000 tons of uranium oxide ore with an average grade of 0.07% uranium oxide.

Construction of the Berbera cement plant with a 100,000-ton-per-year capacity continued during the year. Limestone, clays, and gypsum were to be supplied locally from the Berbera Region. An asbestos cement plant in Berbera with a capacity of 22,000 tons per year began production in late 1976.

Construction continued on the Mogadiscio petroleum refinery. The refinery with a capacity of 10,000 barrels per day (500,000 tons per year) was scheduled to come onstream in late 1978. The Iraqi Fund for Foreign Development financed the project, and the Iraq National Oil Co. agreed to supply the crude oil for the refinery. Somalia relied on imports of petroleum products from the Soviet Union and Iraq to satisfy its domestic demands in 1977.

The African Development Fund granted a loan to Somalia for approximately $5.6 million for infrastructure development. The loan was to finance the construction of a 100-kilometer, two-lane asphalt road from Hargeisa to Boroma, as well as the expansion of the Somali Office of Civil Engineering. The total cost of the project was estimated at $30 million, of which 76% was provided in foreign exchange and 24% in local currency. The Arab Fund for Economic and Social Development (AFESD), the International Development Association (IDA), the Islamic Development Bank, and the Government contributed capital for the project. The EDF and the AFESD agreed to jointly finance the construction of a 248-kilometer road linking Mogadiscio and Kimango. Expansion of the deep water port at Mogadiscio was completed. The new port was to furnish a route into Mogadiscio for shipments which formerly were processed through Merca. The total cost of the project was over $25 million. The new port included a 2,300-foot breakwater, access road, depots, and warehouses.

SWAZILAND[50]

The value of Swaziland's mineral production decreased from $28 million[51] in 1976 to approximately $27 million in 1977 owing largely to reduced iron ore sales. The mining sector has declined in relative importance in the Swaziland economy, and its contribution to national income has decreased to about 12%. The major mineral commodity in terms of revenue was asbestos, which accounted for 64% of mineral value. Iron ore (28%) and coal (6%) were the other important mineral commodities. Kaolin and barite operations closed down in 1976, and iron ore mining ceased in 1977. Tin and gold mining were to resume on a moderate scale, and activity in industrial minerals was likely to increase. The Geological Survey and Mines Department played an important role in prospecting for coal, tin, gold, and industrial minerals and in supervising small-scale mining operations.

Construction began on the rail link to connect the Swaziland Railroad to Richards Bay in the Republic of South Africa. The 90-kilometer section between Phuzumoya and Lavumisa would integrate Swaziland with the South African railroad system and facilitate the expansion of mineral operations. The country has been dependent on a single rail outlet to Maputo in Mozambique through which 80% of Swaziland's exports passed. Opening of the alternative transport route was scheduled for early 1979.

In 1977, Swaziland formed its first shipping company, the Royal Swaziland Maritime Co. Ltd. Leaving from the ports of Durban in the Republic of South Africa and Maputo, three chartered vessels were to carry cargo to Western Europe via the Suez Canal. The shipping company was investigating the purchase of additional carriers.

The Ngwenya iron mine produced about 1.4 million tons of 60% iron ore in 1977 compared with 1.7 million tons in 1976. The mining operation was closed in October 1977 owing to the depletion of the high-grade ore body, but shipments of stockpiled fines were to continue until March 1979. Production was exported to Nippon Steel Corp. in Japan under a contract for the supply of 6 million tons of medium-grade ore. Rail transport and loading facility problems at Maputo prevented the Swaziland Iron Ore Development Co. Ltd. (SIODC) from meeting its contractual target of 2 million tons per year. SIODC was owned 60% by Anglo American Corp. of South Africa Ltd. and 20% by the Swaziland Government.

High-grade iron ore at Ngwenya was depleted in 1974, and middle-grade ore was mined until 1977. The utilization of the country's large resources of low-grade ore was under study by the Government. Total iron ore reserves were estimated at 576 million tons with an average iron content of 34%. In 1977, the Government contracted Belgian consultants to conduct a feasibility study for a pellitization plant, which would use domestic coal in iron ore reduction.

Havelock Asbestos Mines (Swaziland) Ltd. produced approximately 38,000 tons of chrysotile fiber in 1977. The underground mine had a capacity of 2,800 tons of ore (120 tons of asbestos fiber) per day. Plans were underway for sinking an incline shaft to mine the deeper ore levels. The company recently enlarged and modernized the mill's recovery unit for short fiber. Production from the Havelock mine, which began operations in 1939, was exported, largely to the United Kingdom. Shareholders in the mine were the Swaziland Government (40%) and Turner and Newall Ltd. (United Kingdom) (60%).

Production of coal by Swaziland Collieries Ltd. at Mpaka decreased to 128,990 tons in 1977. Output supplied the Swaziland Railroad, local industrial and agricultural demands, and a small export market. Swaziland Collieries was a subsidiary of Anglo-American. The Swaziland Government continued in its attempts to encourage greater domestic use of coal and to secure long-term markets abroad. Studies proceeded on the feasibility of constructing a thermal power station based on expanded coal production from the Mpaka District.

Exploration continued in Swaziland's coalfield, which extended over a distance of 150 kilometers in a north-south direction between Bordergate and Pongola in the Lowveld. Reserves were last estimated at 224 million tons of anthracite. In 1977, it was reported that Johannesburg Consolidated Investment Co. Ltd. (JCI) was conducting feasibility studies on a 600,000-ton-per-year mine based on coal reserves at Maloma. Shell Coal (Swaziland) Pty. Ltd. also located substantial reserves of coal in its prospecting area north of Mbabane. Drilling was to continue in 1978 to investi-

Digitized by Google

gate ground conditions and obtain bulk samples.

Both barite and kaolin operations were closed in 1976. Swaziland Barytes Ltd., which produced approximately 10,200 tons of barite since opening in 1945, closed owing to bankruptcy. Kaolin (Swaziland) Pty. Ltd. ceased mining at Mahlangatsha owing to depletion of the ore body. The Government evaluation of kaolin deposits near the old mine showed over 100,000 tons of kaolin amenable to shallow open pit mining and another 50,000 tons for underground mining. Further studies were to be conducted.

Approximately 2.2 tons of 73% tin concentrates was produced at the tin mine at Sinceni in 1977. The residual tin mines have been worked on a small scale since the late 19th century. Studies were being conducted by the Federal Republic of Germany regarding the exploitation of cassiterite deposits in the Kubuta area. The final report and recommendations were to be completed in 1978.

The gold leaching operation at Red Reefs produced 4,147 troy ounces in 1977. Deposits at Piggs Peak, the major gold producer in the 19th century, were to possibly be reopened under Government supervision. Eland Exploration (Pty.) Ltd. was granted an exclusive prospecting license in 1977 over portions of the southern part of the Greenstone Belt, with work to be extended to the Piggs Peak mine area in 1978.

Swaziland had one clinker-grinding plant operated by Matola Cement Co. The plant, which was located at Matsapa, produced about 70,000 tons of cement per year. Approximately 33,000 tons of granite was produced at the Van der Meer quarry and sold for use in the domestic construction industry. Production increased over the 20,000 tons produced in 1976, owing to new projects in road and railroad construction.

Fertilizer production at the Matsapa plant was about 3,252 tons of nitrogenous products, marketed largely in Swaziland and the Republic of South Africa. Operated by Swaziland Chemical Industries (SCI), the plant used imported ammonia and phosphoric acid as feedstock. A $3.8 million expansion project was to provide the plant with its own bulk-blending and granulation units.

TOGO[52]

Togo's known mineral wealth in 1977 consisted of extensive reserves of high-grade phosphate rock, which were exploited by Cie. Togolaise des Mines du Bénin (CTMB). In both 1976 and 1977, phosphate exports provided approximately half of all of the country's export earnings. Production, which was roughly 2.1 million tons in 1976, increased to 2.8 million tons in 1977. Export earnings for 1977 were estimated at about $92 million. Office Togolaire des Phosphates (OTP), the marketing organization, was successful in 1977 both in diversifying sales and in expanding existing markets. West Europe remained the largest regional market, taking 1.8 million tons. The greatest expansion in the Togolese phosphate market, however, occurred in East Europe, primarily in Czechoslovakia, Poland, and Romania. Outside Europe, deliveries were made to Japan, the Republic of Korea, and Nigeria.

Phosphate rock produced from the open-cast mines in the Kahotoe and Kpogame areas was treated at the Kpeme plant, which has a capacity of 70 tons per hour, or 2.5 to 3 million tons of concentrate per year. Plant expansion, underway during 1977, was to increase this capacity to 4 million tons by 1980. In order to move toward semimanufactured phosphate rock products, the Government completed in 1977 a feasibility study for a phosphoric acid fertilizer plant. Under this plan, which is to cost $300 million, CTMB would be able to market finished fertilizer material, phosphoric acid, and phosphate concentrate.

Exploration work on uranium occurrences between Bénin and Togo's border continued during the year. Uranerzbergbau, a West German uranium firm, and Wyoming Mineral Corp. of U.S.A. extended their geophysical and geochemical work to the east of Laakara during the year. However, by yearend no results were published.

The construction of a small steel plant in the Port Industrial Zone continued during the year. Upon completion, the plant would consist of an electric furnace with an initial steel capacity of 20,000 tons per year and a rolling mill with a capacity of 40,000 tons per year. Feed material for the plant initially was to be scrap and later iron ore from indigenous deposits. These iron ore deposits,

Digitized by Google

located nearly 100 kilometers away near Bassar in north-central Togo, had no railroad connection and no infrastructure. Also, a thermal plant with a 115-megawatt capacity to supply energy for the steel plant was in the construction stage. The steelworks and powerplant were owned by the Togolese Government and were to be operated by the Société Nationale de la Sidérurgie with financing of both projects by a group of European banks.

Oceanic Resources Ltd., a subsidiary of Oceanic Exploration Co. of U.S.A., continued mapping and exploration efforts on the Upper Volta River basins during the year. The company's concession rights include 580,000 acres offshore and 1.4 million acres onshore. The Lane petroleum refinery, built by two British firms (Humphrey and Glasgow and Civilian Press International), started production during 1977 and was to be officially inaugurated by 1978. The refinery, with a 1-million-barrel annual crude oil capacity, was to be connected by a 28-kilometer-long pipeline to an oil port. The refinery will be operated by Togolese Hydrocarbon Co. in which the Libyan Government holds 40% of the capital. Total cost of refinery was given as $90 million.

The construction of the Togo-Ghana-Ivory Coast clinker plant known as Ciments de l'Afrique de l'Ouest (CIAMO) proceeded on schedule. The plant was to produce 1.2 million tons of clinker per year with a possibility of doubling this capacity later on. The initial production date was given as the early 1980's.

UGANDA[53]

The mineral industry of Uganda continued to play a minor role in the nation's primarily agrarian economy in 1977. Information was not available on many sectors of Uganda's economy, including mining. However, mining contributed less than 1% to the GDP, and the total value of mineral products was estimated at $14 million.[54]

Copper retained its position as the most important mineral product, followed by cement, cassiterite, apatite, bismuth, wolframite, and columbite-tantalite concentrate. Production of building materials, clays, sand, stone, gravel, and salt undoubtedly took place for domestic consumption.

In 1977 Uganda began building a facility with West German financial and technical aid to utilize Lake Katwe brines for the production of table salt and muriate of potash. Production was to commence late in 1978 at an initial rate of 50,000 tons per year of sodium chloride and 17,000 tons per year of potassium chloride.

UPPER VOLTA[55]

An arid, landlocked country where industrialization and urbanization were minimal, Upper Volta had no significant mineral production in 1977. Plans for mineral development were being pursued, however. The second 5-year plan (1977-81) was to allot 21% of the development expenditures to the Tambao mine and railroad, the Poura gold mine, and the Tin H'Rassan cement plant. The manufacturing and industrial sector accounted for about 36% of the GNP, which was valued at $700.4 million[56] and represented a growth rate of 16.9% compared with the 1976 value. The average rate of inflation was 12% over the last 5 years.[57]

The overall investment climate of Upper Volta was considered favorable owing to the stable government. The Upper Voltans had a liberal investment code, which granted tax and customs exemptions up to 25 years in certain cases, afforded tariff protection, eased foreign currency restrictions, and guaranteed arbitration. Upper Volta was also pursuing a policy designed to increase Voltan control of vital domestic business and financial activities. In large enterprises, Voltans must own at least 51% of the stock. In 1977, the process of complete transition to civilian rule in Upper Volta was started. A new constitution, establishing three branches of government (executive, legislative, and judicial) after the French model, was approved on November 27, 1977. Presidential elections were to be held in April and May of 1978.

Upper Volta experienced a trade deficit in 1977 with imports, valued at $237 million, far exceeding exports, valued at $89 million. Petroleum imports were valued at $11.3 million in 1976, and were estimated to

Digitized by Google

comprise 6% of the total 1977 import value. Upper Volta received a balance-of-payments support loan of $2.25 million in 1977 from the Organization of Petroleum Exporting Countries (OPEC) special fund. Upper Volta was a member of several international trading and economic unions, including the West African Economic Community (CEAO), the Economic Community of West African States (ECOWAS), and the African and Malagasy Common Organization (OCAM).

Upper Volta was also a participant in the Authorite de Developpement Integre de la Region du Liptako-Gourma, an organization formed to foster mineral, industry, and infrastructure development in the region that includes Mali, Niger, Togo, and Upper Volta. The Liptako-Gourma development program was calling for investments of $1 billion, which would enable exploitation of the region's resources. The project also called for an extension of the Togolese railroad to Upper Volta and Niamey, Niger, and then to Mali, following the course of the Niger River. A survey commission was to be set up to study this proposal. The Inter-African Mining Commission was established in 1977 to undertake technical economic assessment of the area. Projects under immediate assessment included the phosphate deposits of eastern Upper Volta, of Bourem in Mali, and of the "W" region of Niger; the manganese deposits of Ansongo and Ofalikin in Mali and of Tera in Niger; the iron deposits of Say in Niger and of the Buem basin in northern Togo; and the kaolin clay and pink granite of northern Togo. Canada made a loan of $2.3 million for geophysical prospecting in the Liptako-Gourma area for exploration drilling equipment and for construction of the Beli Dam for water at Tambao.

Transportation problems were of primary importance in the nation's development plans. The country had fewer than 700 kilometers of paved roads. The ocean ports in Ivory Coast, Ghana, and Togo that serviced Upper Volta were more than 700 kilometers from Ouagadougou, so that transportation costs were always high. Establishment of a new railroad was also vital to the development of the Liptako-Gourma area and the Tambao manganese deposit. However, the Tambao project was further delayed in 1977 by the withdrawal of Union Carbide Corp., which had a 7% share in the mining consortium. Funding for the Fada N'Gourma, Upper Volta, to Niamey, Niger, road was secured during 1977. The African Development Fund financed about $6.7 million for construction of the road from Dori to Djibo.

Airborne geophysical prospecting was being carried out by Bundesanstalt für Geowissenschaften und Rohstoffe (BGR) of the Federal Republic of Germany for diamond in the Banfora area, and the UNDP was systematically exploring 70,000 square kilometers north of Ouagadougou. The UNDP had made $2.3 million available for mineral research in Upper Volta. Special attention was to be given to the Boromo and Hounde areas, where gold, copper, lead and zinc, and molybdenum occurrences were located. This program had revealed indications of copper near Wayen and lead-zinc near Garango. A new stibnite deposit was reported at a locality 100 kilometers from Ouagadougou and 30 kilometers from the new railroad. Reserves of 30,000 tons of stibnite ore were indicated. The copper deposits near Gaoua, containing 40 million tons of 0.8% copper and 2 grams per ton of gold, were under study by the UNDP. The phosphates of the eastern region (Arly, Kodjari, and Aloud Djouama) were estimated at 250 million tons of 30% P_2O_5. The ore was reported as friable, containing no quartz, and mostly oolitic phosphatic pellets, and as being amenable to open pit mining. Several firms were also exploring for uranium.

A nickel deposit was located about 30 miles west of Koudougou at Bongo. Reserves were estimated at 30 to 70 million tons of nickel laterite containing 1.5% to 3% nickel. The deposit was located less than 8 kilometers from the railroad between Ouagadougou and Abidjan. One of the first drill holes in the 6-square-kilometer area indicated a shallow deposit grading 2.5% nickel over approximately 14 meters. The joint UNDP-Government exploration team was continuing preliminary investigations of the deposit.

The Poura gold mine was under development with reopening scheduled for 1978 by Société de Recherches et d'Exploitations Minières (SOREMI). The capital for SOREMI was distributed among the Government (34.1%), BRGM of France (22.9%), the Société des Mines et des Produits Chimiques (SMPC) (32.4%), the Consultancy and Development Co. (7.5%), and miscellaneous participants (3.1%). An increase in capital was anticipated, which would bring Upper Volta's share to 51%. The workable reserves were currently estimated at 15 tons of gold for the gold-bearing quartz vein (15 grams

Digitized by Google

per ton of ore) and 400 kilograms of gold for the workable dumps of the old mine (1.36 grams per ton). The mine had not been worked since 1966.

BAHAMAS

The Bahamas Oil Refining Co. (BORCO) refinery in Freeport continued to operate at less than half its full 500,000-barrel-per-day capacity. Although owned through subsidiaries by the Carey Energy Corp. (65%) and Standard Oil Co. of California (35%), BORCO is ineligible for participation in the Crude Oil Entitlements Program granted to companies operating within the United States proper or its territories. Like some other Caribbean refineries, BORCO has suffered a loss of normal market outlet due to the cost advantage afforded U.S. refineries by the Entitlements Program. Saudi Arabia, Nigeria, and Libya are the major suppliers of crude for the refinery. Its principal products, motor spirits, aviation fuel, distillate fuels, and residual fuel oils, were marketed in the United States and Puerto Rico.

The Government-owned Bahamas Development Corp. and Burmah Oil Co. Ltd., held discussions pertaining to a renegotiation of Burmah Oil's management contract for the Grand Bahama Oil Transshipment terminal. The desired contract modifications were not made public but financial problems have plagued the terminal and its operation since construction started in 1972.

Despite some offshore potential there still has been no petroleum exploration activity in the Bahamas. Appropriate legislative action to update the Petroleum Act of 1971 is expected during 1978.

As previously announced, Bahama Cement Co. closed operations at midyear, after which the Bahamas ceased being an exporter of cement.

BARBADOS

The economy of Barbados experienced a 5% increase in real growth during 1977. This was only slightly less than that obtained during 1976. The mineral industries remained of minor economic importance, limited to some crude oil, natural gas,

eEstimate. pPreliminary. rRevised. NA Not available.

[1]In addition to the countries listed individually in this table, Bermuda, Grenada, and St. Lucia presumably produced crude construction materials (clays, sand and gravel, and stone) but output is not reported and available information is inadequate to make reliable estimates of output levels.

[2]In addition to the commodities listed, mineral commodity output may also include crude construction materials (sand and gravel, lime, and salt) other than those listed, but data on such production are not collected and available information is inadequate to make reliable estimates of output levels.

[3]In addition, gypsum, iron ore, manganese ore, pyrite, and salt, all produced in significant quantities prior to the termination of publication of official statistics, presumably were produced during the period covered by the table, but information is inadequate to formulate reliable estimates of output.

[4]Period is for year ending June 30 of that stated.

[5]Includes nickel content of nickel oxide and nickel fonte in addition to metallic nickel and ferronickel.

[6]Export figure, all production presumed to be exported.

[7]Includes crushed volcanic rock, limestone, diorite, or quartzite used for building stone, aggregate, road construction, etc.

[8]Figure included in gasoline.

[9]Reported figure is 12,700 metric tons.

[10]Reported figure is 5,690 metric tons.

[11]Less than 1/2 unit.

[12]In addition, may produce limited quantities of byproduct sulfur from natural gas.

quarry and other construction-oriented materials produced mostly for local consumption.

General Crude Oil Co. drilled six wells for a total of 37,200 feet during 1977. Of these developmental wells, five produced oil and one produced natural gas. Total average daily crude oil production during 1977 was about 500 barrels, an increase over the average of 400 barrels per day produced during 1976.

The Governments of Barbados and Guyana contracted engineering and project management services from Holderbank Consulting Ltd. for the island's only cement plant. The plant was expected to become operational in 1979 with an annual capacity of 250,000 tons of clinker. The Barbados plant will grind 150,000 tons into cement annually while the remaining 100,000 tons of clinker are destined for shipment to Guyana for grinding. The contract with Holderbank included a provision for additional docking facilities to accomodate the clinker export.

BERMUDA

Small quantities of sand, dimension limestone, and crushed limestone remained the center of mining activity in Bermuda. The local construction industry consumed all the building materials produced.

CUBA

Unlike most other major world nickel producers that suffered throughout 1977 from depressed demand and an oversupplied market, Cuba completed the year unscathed by virtue of its membership in the Council for Mutual Economic Assistance (CMEA).[2] Through CMEA membership, Cuba had fixed-price ($2.72 per pound nickel f.o.b. Cuba), long-term sales contracts. With the security of its own guaranteed market Cuba continued plant expansion plans despite the downward trend in world market conditions. The first expansion phase has been initiated and included modernization of the Pedro Soto Alba plant at Moa Bay and the René Ramos Latour plant at Nicaro. Current capacity of 18,000 tons of nickel per year at each plant will be expanded to permit a combined output of 46,500 tons per year by 1980; by 1985 it is

Digitized by Google

anticipated that the combined output will reach 90,000 tons per year. Phases two and three include the construction of additional mine and plant capacity to bring 1990 total nickel production to 180,000 tons per year.

The construction of a 50,000- to 100,000-ton-per-year capacity stainless steel plant was planned for Holguin near Nicaro, with a completion date of 1985. Most of the steel produced would be used in the manufacture of equipment for the sugar refining industry. The 350,000-ton-per-year carbon steel plant at Antillana was under expansion.

Construction continued on the largest Cuban cement plant, Rene Acray, at Mariel. When it comes on-stream in 1978 with an annual output of 700,000 tons of cement, total Cuban production will exceed 3 million tons per year. Expansion set for a late 1979 completion will boost total Rene Acray plant capacity to 1.4 million tons per year. The plant is designed to be computer-controlled and nearly fully automated. It is anticipated that completion of this plant as well as some new, smaller plants will enable Cuba to add cement to its list of export commodities.

Four new oilfields were discovered in the North Cuban Basin from late 1976 through 1977. These fields, the Varadero, Camarioca, Chapelin, and Boca Jaruco, were not expected to offset production declines from the older fields in central Cuba, notably Jatibonico, discovered in 1954, and Cristales, discovered in 1956. Of the new fields, Varadero was thought to be the largest in the Basin. Production data from the new fields were not available. Total Cuban production was variously estimated at 1,000 to less than 3,000 barrels of crude oil per day.

Imports of oil from the U.S.S.R. continued to supply the bulk of Cuba's domestic needs. These imports during 1977 were reported as over 160,000 barrels per day. Oil refining capacity was estimated at 120,000 barrels per day. Six to eight heavy land rigs were reported working in 1977, but only one seismic crew and a few geological field parties were known to have been actively engaged in exploration activity.

To alleviate some of the domestic need for fuel oil and ease the foreign trade deficit, Cuba's current 5-year plan (1976-80) included the construction of a nuclear electric power station with a rating of 880,000 kilowatts.

Table 2.—Cuba: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Chromium ore and concentrate	25,021	15,346	Poland 4,967; West Germany 4,959; Spain 4,000; Austria 1,420.

[1]Data are compiled from 1976 edition of the United Nations Supplement to the World Trade Annual, v. II, as well as official trade statistics of Bulgaria, Czechoslovakia, Hungary, Poland, and U.S.S.R.
[2]Data incomplete, tonnage not available for all sources.
[3]Individual commodity totals for 1976 and data on distribution by trading partners exclude figures for U.S.S.R., which are not divided by individual metals, but rather are reported in two categories listed at the end of the metals section as "Nonferrous metals including alloys: Unwrought and semimanufactures."

DOMINICAN REPUBLIC

Total exports from the Dominican Republic rose to about $780 million for 1977, of which at least 25% was attributable to minerals. Exports of gold, silver, nickel, and bauxite, the principal mineral products, remained at about the same level as in 1976 but declines in the prices of agricultural exports served to emphasize the impact of minerals on the economic sector.

In 1976 the Government began studies directed towards the establishment of a new law to regulate the mining industry. In 1977 the Government sponsored a symposium to draft new mining legislation but formal Senate acceptance of recommendations did not materialize. Meanwhile, the 1976 participation agreement with Rosario Dominicana S.A., and the 1977 agreement with the Aluminum Company of America (Alcoa) that effectively tied bauxite royalty payments to the computed average price of aluminum, appeared to be indicators of the still-developing Government policy. Exploration licenses for metallic minerals were granted only through specific contract negotiation with the Executive Power.

Increased gold and silver values offset rising production costs for Rosario's Pueblo Viejo mining, milling and cyanide complex located about 50 miles northwest of Santo Domingo. The complex is a joint venture of Rosario Resources (27%), Simplot Industries (27%) and the Dominican Republic (46%), and includes the largest open pit gold mine in the world. The mill treated 2.6 million dry tons of ore in 1977, approximately the same as the previous year, but 1977 gold recovery was 348,473 troy ounces, a decrease of 16% from that of 1976, and silver recovery was 1,357,290 troy ounces, an increase of 50% over 1976 production. These differences reflect variations in the metal distribution within the ore body. Reserves consist of an estimated 23 million tons of oxide ores amenable to cyanide treatment with an average assay of 0.117 ounce of gold per ton and 0.69 ounce of silver per ton. A new jaw crusher was installed and work was underway on a new grinding mill to increase daily throughput capacity from 8,000 to 9,000 tons. Rosario produces 75-pound bricks of dore bullion averaging about 20% gold and 80% silver which are assayed, stamped, numbered, and shipped to Switzerland.

In 1976 small beads of mercury were found in the exhaust fan at the Pueblo Viejo cyanide plant. Subsequent investigations revealed that ore precipitate contained 8% to 10% mercury and its removal from the bullion was essential to prevent contamination. The actual mercury mineral or minerals present in the ore have not been identified but all or most of it is believed to be taken into solution as the milled ore passes through the plant circuit since the quantity of mercury produced is compatible with the mercury analysis of the ore. An extension to the plant was constructed to house the 12 retorts installed for mercury recovery and following initial startup in March a total of 515 flasks were recovered during 1977 although no shipments were made from the plant. The recovery was not expected to be a profitable operation due to the current market price of mercury but its removal reduces the impurities, moisture content, and bulk of the precipitate, consequently lessening the need for fluxing reagents and melting furnace operating time during the sub-

Digitized by Google

sequent production of dore.

Falconbridge Dominica C. por A. (FALCONDO), the fourth-ranking nickel producer within the market economy countries, did not escape the effects of diminished market demand. Production levels were maintained until about midyear, but by November, plant output had been reduced to one-third of capacity and the work force was cut from 2,150 to 1,600 employees. Yearend figures did not reflect the severe reductions as about 71,000 tons of ferronickel were produced in 1977. Contained nickel amounted to about 24,200 tons compared with 24,400 tons in 1976. Contained nickel exports, however, were 20,000 tons during 1977, a decrease of 5,000 tons from 1976 shipments.

Alcoa signed a new one-year bauxite agreement that provided for an extraction tax as determined by Alcoa's average sale price of aluminum. Alcoa's bauxite deposits are located in the Bahoruco Mountains of Pedernales Province in the southwestern part of the Dominican Republic. Ore is moved by truck along one of the world's longest hauling roads (24 miles) to Cabo Rojo where it is solar dried and exported to the United States. Production rose slightly during 1977, to 642,667 tons but remained about half of that produced in 1974, a reflection of both poor world market conditions and Alcoa's shift to bauxite production in Guinea, West Africa.

The prospects of finding substantial reserves of oil in the Dominican Republic prompted several companies to negotiate exploration concessions during 1977. Petrolera Las Mercedes S.A., a private Venezuelan firm, received the Azua, Bani Llamura Oriental zones and the offshore southeast coastal area from Catalina Island to Palenque. Magnetic, gravity, and seismic work were completed during 1977 and drilling is targeted to start in 1978. An exploration permit was granted to Eastern Petroleum Co., a Houston-based U.S. company, in association with Canadian Superior Ltd. of Calgary, Alberta, for a 735,000-acre tract covering the Lago Enriquillo Basin area in the southwestern part of the country near the Haitian border. Canadian Superior is an affiliate of the Superior Oil Co. of Houston, Tex., a principal owner of FALCONDO.

Quisqueya Oil, a private Dominican firm, will explore the Cibao Valley. Quisqueya's production sharing contract covers 6,562 square miles of onshore and offshore areas in northern and northwestern Dominican Republic. The contract called for an expenditure of $5 to $6 million during the four-year exploration period. A private U.S. firm, Cariboil, will explore the onshore Cenca de San Juan block. Its concession area covers 1,560 square miles in the west-central part of the country. Corporación Dominicana de Electricidad (CDE) began a testing program on old wells in the Maleno field, currently held by Las Mercedes. CDE asked the Government for a concession to include a 3-mile radius area around each well.

HAITI

Bauxite remained the principal mineral resource contributing to the Haitian economy and continued to rank second in total foreign exchange earnings. In January, Reynolds Haitian Mines Inc., a subsidiary of Reynolds Metals Co. (United States), reached a new 5-year agreement with the Government. The agreement included a new tax computation formula which provided that the proportional tax be based on the tonnage of bauxite exported. The severance tax computation contained a provision for a tax rate of 7.5% of the average realized price of primary aluminum. The new contract agreement may be extended for an additional five years.

Offshore oil exploration had an unfortunate beginning as Crux International Ltd., a subsidiary of Southern Cross Petroleum Co., drilled three dry holes in its 1.5-million-acre concession located about 13 miles northwest of Port-au-Prince in water averaging 300 feet in depth. Crux did not plan to continue drilling until it completed an evaluation of the collected data. A Venezuelan firm, Hideca de Venezuela, was the only other company with petroleum rights in Haiti. Hideca continued conducting gravity surveys in the Plateau Centrale.

The joint venture between the Government and the Société Minière d'Haiti, S.A., a subsidiary of Kennecott Copper Corp., continued its exploration for sulfide deposits in northern Haiti. The discovery of a sizable copper deposit was reported but details were not available. The Société Franco-Hatienne de Mines S.A., a subsidiary of Penarroya of France, and the Hai-

Digitized by Google

tian Government continued their joint sulfide exploration activities in northern Haiti, drilling on several copper prospects. The agreements with both Kennecott and Penarroya provided that Haiti will hold a 40% interest in each developed prospect.

The Institut Nacional de Resources Minérales (INAREM), formed by the Government in 1976 to participate in the exploration and development of resources, and the United Nations Development Program (UNDP) continued their joint mineral deposit survey of northern Haiti and expanded their investigations to include the southern half of the country. Earlier work by the UNDP in northern Haiti identified 14 copper deposits, mostly porphyry. One of these porphyry deposits, in the Terrier Range near Fort Liberté, was reported to contain 150 to 200 million tons of reserves grading 0.6% copper and is now under study by both the Geological Survey of Hanover, Federal Republic of Germany, and Metallgesellschaft as part of a German foreign aid program. Definitive exploratory drilling is projected, with three deep holes planned for 1978.

JAMAICA

Bauxite remained Jamaica's major mineral resource during 1977 as bauxite-alumina production accounted for two-thirds of the country's export earnings and 16.5% of the gross domestic product (GDP). Revenues derived from the bauxite-alumina industry amounted to $190 million in 1977, a 30% increase over that of 1976. Despite this gradual improvement in bauxite earnings, Jamaica remained confronted with serious economic problems and further tightening of import restrictions, reduced government spending, and other stringent controls were projected. Although the Government offers assurance that it encourages foreign investment, especially with government participation, there is an increasing problem in retaining foreign capital as well as skilled labor in the country. Furthermore, since the introduction of the increased bauxite levy in 1974, there has been no expansion of the bauxite and alumina industry.

In February, the Kaiser Aluminum & Chemical Corp. and the Government of Jamaica finalized a partnership agreement in which the Government purchased a 51% interest in Kaiser Bauxite Co.'s mining operation. Kaiser sold all of its bauxite land, resettlement lands and other property not required for plant operation to the Government. The new partnership, Kaiser Jamaica Bauxite Co., received a 40-year mining lease for sufficient bauxite to supply two Kaiser alumina plants in Louisiana at their current rate of production. The agreement provides that Kaiser may purchase bauxite from the partnership at cost and will pay the Government a return on its investment in the partnership. In return for the mining rights Kaiser will pay the Government annually an amount equal to 7% of the Government's purchase price for the land under the mining lease. The new company received a reduced bauxite levy of 7.5% with a further reduction to 7% after production passes a certain level.

Reynolds Jamaica Mines Ltd., a subsidiary of Reynolds Metals Co., also finalized an agreement with the Government that provided for the State to purchase a 51% interest in Reynold's mining operations. As in the Kaiser agreement, Jamaica purchased Reynold's mining and agricultural lands at book value while guaranteeing the new company, Jamaica Reynolds Bauxite Partners, mining leases for bauxite reserves sufficient for 40 years at the current rate of production. An agreement for government participation in Alcan Jamaica Ltd.'s mining and refining operations was expected to be completed in 1978. The Alumina Partners of Jamaica (ALPART) bauxite-alumina operation, owned through its Jamaican subsidiaries by Kaiser Aluminum & Chemical Corp. (36.5%), Reynolds Metals Co. (36.5%)

Digitized by Google

and The Anaconda Company (27%) is expected to enter into a similar agreement in the near future.

The Overseas Private Investment Corporation (OPIC), a U.S. Government insurance agency, rejected the application for expropriation compensation filed by Revere Jamaica Alumina Ltd. Revere's Jamaican bauxite and alumina operations were suspended in August 1975 because, according to Revere, of the weak demand for aluminum and partially owing to the economic effect of a substantial increase in the bauxite production levy Jamaica imposed on the company in 1974. Revere contended that the amount of excess levy, over and above that provided for in its 1967 investment agreement, for the years 1974 and 1975 came to over one-sixth of its stockholders' equity at the end of 1973. Revere claimed that the increased levy was tantamount to expropriation. Meanwhile, Revere did obtain a minor victory when the Jamaican Supreme Court ruled that although the increased production levy was valid, it could not be applied in any full year when the company's facilities were not in production. The Government had required that Revere continue paying the levy as if it were producing bauxite at the rate of 445,000 tons per year. Revere's appeal against the OPIC decision was pending before the American Arbitration Association. Revere has also undertaken legal actions to avoid losing its mining lease due to the extended shutdown. The Jamaican mining law stipulates that any lease in a nonproducing status for more than 6 months automatically expires unless special consent is secured from the Ministry of Mines. The Government has not taken any action to cancel the mining lease, but neither have they granted an exception to the law based on Revere's contention that the shutdown was due to the depressed state of the world's aluminum industry. The Jamaican Supreme Court refused to rule on Revere's request for an extended cessation of production.

Jalumex, the bauxite-alumina-aluminum processing complex proposed as a joint partnership between the Governments of Jamaica and Mexico had not received final official approval by both parties at the end of 1977. Construction, originally expected to be initiated in 1977, was delayed pending finalization of the agreement.

The projected 80,000-barrel-per-day oil refinery to be constructed at Luana Point, St. Elizabeth, has been postponed indefinately and at least some employees of the Petroleum Co. of Jamaica (PETROJAM) were being assigned to other Government activities. The refinery was to be part of a large petrochemical complex which included a

caustic soda plant to support the proposed Jalumex alumina plant. The Government reported that PETROJAM offices were not closed.

There was no active petroleum exploration during 1977 although some stratigraphic testing was planned for 1978. The Norwegian Government offered financial and technical assistance for offshore exploration and preliminary surveys were expected to begin in 1978.

MARTINIQUE AND GUADELOUPE

Both Martinique and Guadeloupe are heavily dependent on French Government subsidies and local expenditures to maintain their current levels of economic development. Mineral production in Martinique consisted mainly of pumice, construction aggregates, fertilizers, and cement, all of which was for domestic consumption. The petroleum refinery at Fort de France maintained its output of gasoline and residual and distillate fuel oils.

Guadeloupe's mineral production of domestically consumed construction aggregates did not contribute to export growth.

NETHERLANDS ANTILLES

Petroleum refining and related activities continued to play an important role in the economy of the Netherlands Antilles during 1977, accounting for 40% of the gross national product and employing 9% of the total work force. Despite the country's appearance of economic prosperity, there were undertones of potential difficulties that can be directly linked to the declining fortunes of the Shell Curaçao N.V. refinery on Curaçao and the Exxon Lago refinery on Aruba. Negative factors pyramiding against the profitable operation of the refineries included the weak international market demand for petroleum products and implementation of the U.S. entitlements program which offered cost advantages to U.S. refineries. Exxon and Shell have had to contend with a drastic loss of their normal U.S. markets plus the increased tendency of other traditional outlets to build their own refineries. The Shell refinery sales to the United States were reported to have dropped 94%, from 265,000 barrels per day in 1973-74 to a mere 16,000 barrels per day in 1977. Market losses required a severe cutback in refinery output which, in turn, created a high unit cost for refined products, which made competition in international trade even more difficult and inhibited efforts to seek additional market outlets. Shell has officially commenced an austerity program to control costs until a more favorable market condition develops.

Marathon Oil Co. drilled its first exploration well off Saba Bank. The well was abandoned at 9,576 feet and Marathon did not plan to drill another test during 1978. A State-owned corporation, Saba Bank Resources, was established by the Government to administer exploration and development activities on the Bank.

ST. LUCIA

Informal discussions and feasibility studies begun in 1976 culminated this year in the finalization of an agreement between the St. Lucia Government and Amerada-Hess Corp. (United States) to establish an oil refinery and transshipment terminal in the former sugarcane valley of Cul de Sac, near Castries. The agreement is known as the Oil Refinery Act of June 1977. The new company, Hess Oil St. Lucia Ltd., is wholly owned by Amerada Hess. This new refinery complex would be complementary to the Hess operation located at St. Croix, U.S. Virgin Islands.

Construction work on the project site was initiated and the complex is expected to be

Digitized by Google

completed in 3 years. The deep water (80 to 90 feet) within 1 mile of shore will accomodate supertankers. Hess received an initial 50-year license and very favorable long-term and wide-ranging exemptions from taxes, customs and other duties, harbor and wharfage dues, and similar costs. The Government will receive 2 cents (US) for every barrel of crude oil and other petroleum products delivered and exported from the terminal and 4 cents (US) for each barrel produced and exported from the refinery. It was estimated that the complex will ultimately employ about 3,000 persons, the majority of whom will be St. Lucians. When completed, the refinery will use Middle Eastern oil and is expected to produce a minimum of 250,000 barrels per day. The agreement with Hess stipulates a penalty for noncompletion of the project. The Government visualized the project site to be part of a "free zone" which would become an industrialization center.

The Commonwealth Development Corp. (CDC) began a survey of the commercial geothermal potential of an area near Soufriere. Some exploratory drilling had been done in 1975 and steam production from two of the seven holes drilled amounted to about 1 megawatt of electricity. CDC is the major shareholder and manager of St. Lucia Electricity Services. Castries Town Council and the St. Lucia Government are partners in the geothermal development project.

TRINIDAD AND TOBAGO

Petroleum dominates the economy of Trinidad and Tobago and has contributed substantially to the economic growth and stability of the islands. With the increases in heavy crude oil demand and oil prices since 1973, the Government has accumulated a capital surplus which has been used in a continuing effort to develop and diversify the agricultural and industrial sectors of the economy in order to reduce future economic dependence on hydrocarbon revenue. Recent offshore oil and gas discoveries have reversed a slight downward production trend. Government incentives directed toward land reform, agricultural development and diversification, and industrial decentralization show indications of general support as population trend studies revealed a visible shift away from the urban center toward rural and suburban areas. The construction materials sector benefited from high levels of demand resulting from this industrial and residential growth.

Last year's crude oil production decline was reversed as output rose to a daily average of 230,000 barrels, representing an 8% increase over the 1976 rate and a 7% increase over 1975 daily production. Offshore operations contributed over 80% of total crude oil production. Amoco Trinidad Oil Co. Ltd., the major offshore operator, accounted for almost 74% of the total offshore production. Amoco increased its offshore production 15% over 1976 by the completion of new wells in the Poui Field and added capacity at the Point Galeota terminal. The second major offshore company, Trinidad Northern Areas Ltd., contributed 25% of total offshore crude production. This represents a slight decline from Trinidad Northern's 1976 output and was caused by delays in alterations and development drilling. Onshore production showed a slight increase over that of 1976, due principally to increased production by the Trinidad and Tobago Oil Co. Ltd. (Trintoc) and Trinidad-Tesoro Petroleum Corp. Texaco, Inc., commanded 41% of total onshore production, followed by Trinidad-Tesoro with 39%, Trintoc with 18%, and Premier Consolidated with less than 1%.

The South East Coast Consortium, consisting of Texaco Trinidad Inc. (operator), Trintoc and Trinidad-Tesoro Petroleum Corp., continued its successful oil and gas exploratory drilling in Block L off the southeast coast of Trinidad and planned to construct platform and production facilities. Deminex, a West German company, and Occidental Petroleum Corp. (United States) have both had encouraging gas discoveries off the north coast of Trinidad. The Government negotiations with Texaco for joint ownership of the 350,000-barrel-per-day refinery at Pointe-a-Pierre in southern Trinidad, were unresolved at yearend. The Texaco refinery operated at 61% of capacity in 1977 and projections for 1978 were not optimistic. The government-owned Trintoc refinery, operated at about 60% of its 100,000-barrel-per-day capacity in 1977.

The Government of Trinidad and Tobago announced that two U.S. companies, Tenneco Trinidad LNG Inc. and Peoples Overseas Inc. (subsidiaries of Tenneco Corp. and Peoples Gas Corp.), will join the Government in

Digitized by Google

development of the LNG project to be located at Point Lisas, Trinidad. Capacity levels will be based on the results of an ongoing survey of the country's gas reserves. Tenneco and Peoples will purchase LNG on a 20-year contract with first delivery expected in 1983.

High on the list of the Government's industrial expansion projects was the 450,000-ton-per-year integrated direct reduction steel billet plant on the Point Lisas Industrial Estate. The government-owned Iron and Steel Co. of Trinidad and Tobago Ltd (ISCOTT) has started construction of phase one despite the withdrawal of its partners, Estel N V Hoesch-Hoogovens, Kawasaki Steel and Mitsui Co., last year. Phase one of the three-phase plant construction has been scheduled for completion in 1979.

Plans for a 200,000-ton-per-year aluminum smelter at Point Lisas received at least a temporary setback when the Government's two projected partners, Jamaica and Guyana, withdrew from participation in 1976. The Government now envisions the smelter project as a one-nation endeavor and requested bids for a feasibility study on a 75,000-ton-per-year facility.

BELIZE[1]

Mining activity during 1977 was limited to the production of limestone, marl, and sand and gravel, all of which were used domestically. Public works projects consumed the major portion of the construction material produced.

The consortium of oil companies operating as Esso Ventures Inc., drilled one exploratory well off the coast of southern Belize. For drilling the well, Exxon Corp. received a 57% working interest in the consortium's concession located 40 kilometers east of Punta Gorda. No other offshore drilling was attempted in 1977. Esso also drilled a well on the Anschutz Overseas Inc. concession in the Toledo District of southeastern Belize. The attempt was abandoned, but seismic activities continued.

To the north of Esso's offshore acreage, Reef Exploration, Ltd., of Houston, Tex., received 18 offshore licenses covering 7,249 square kilometers. In 1975, Chevron Oil Co. had abandoned this same area after drilling a dry hole.

[e] Estimate. [p] Preliminary. [r] Revised. NA Not available.

[1] Content of sinter.

[2] Revised from none.

[3] From lead and zinc concentrates.

[4] In addition to the commodities listed, Nicaragua produces a small but undetermined quantity of cadmium contained in zinc concentrates produced for export.

[5] Produced 60,000 metric tons in 1975.

[6] Totals for each year exclude the amount reported in volumetric units of 8,000 cubic meters.

COSTA RICA[1]

New mining legislation has been under consideration by Costa Rica in response to general concerns that present laws do not properly protect the national interest or establish sufficient Government control over mineral resource exploitation and resulting benefits. Uncertainty regarding the final version of the anticipated new mining law has resulted in considerable hesitancy on the part of investors to seek new exploration concessions and a reluctance on the part of the Government to award them. As a result, no new mineral exploration permits have been issued.

Martin Marietta Aluminum, Inc. continued to study the feasibility of joining with the Government, The Aluminum Co. of America (Alcoa), and possibly a Japanese company to construct a 250,000-ton-per-year aluminum smelter. The smelter would consume about two-thirds of the energy produced at the proposed 760-megawatt-capacity Boruca hydroelectric project and obtain alumina from Martin Marietta's proposed refinery on St. Croix, the Virgin Islands. In 1976, Alcoa abandoned the low-grade (30% alumina content) bauxite deposit located in southern Costa Rica after studies indicated that it would be uneconomical to develop. Tecno Hunter Engineer-

Digitized by Google

ing S.p.A. of Italy and State-owned Corp. Costarricense de Desarrolla (CODESA) planned to construct a 10,900-ton-per-year-capacity plant near Puntarenas for the manufacture of finished aluminum products. The plant should be operational in 2 or 3 years and will use imported ingot.

In 1975, studies were initiated to determine the feasibility of constructing a geothermal powerplant on the slopes of the Miravalles and Rincón de la Vieja Volcanos in the Province of Guanacaste. Results were encouraging, and in 1977, the Government obtained additional funds from the Inter-American Development Bank to drill several deep holes to establish an economic basis for further development.

Cía. Minera de Guanacaste was the only producer of gold and silver in 1977. Total production was estimated at 12,250 troy ounces of gold and 1,350 troy ounces of silver. The company worked the San Martín and Tres Hermanos veins, which have ore reserves of about 272,000 tons averaging 0.33 troy ounces of gold per ton. In 1976, Bulora Corp. Ltd. suspended operations at the El Líbano gold mine southeast of Tilarán but was reported to be continuing exploration. After being closed for 30 years, the Sacra Familia y Cía. gold mines in the Aguacate area were reportedly ready to commence production with a combined milling capacity of 100 tons of ore per day.

United Hearne Resources Ltd., a Canadian company, continued its evaluation of the Santa Clara low-grade, gold-silver deposit. With the feasibility study more than half completed, ore reserve estimates were increased to over 5 million tons grading 0.11 troy ounces of gold and a small amount of silver per ton. United Hearne holds the property under option from Barranca Corp., which retained a 30% interest. United Hearne was also reported to be interested in the Playa Camerones property located to the north of Santa Clara.

EL SALVADOR[1]

Gold and silver remained the major mineral products in this country, which is economically dominated by coffee, cotton, and sugar export crops. El Salvador had not yet issued permits to explore for petroleum. The Government, however, made arrangements for the preparation of a draft for new legislation governing hydrocarbon exploration.

Minas San Cristóbal S.A., a subsidiary of Javelin Corp. (United States), suffered considerable production declines, primarily owing to the expansion of the San Cristóbal mill, formerly known as the Montecristo mill. The 200-ton-per-day-capacity mill can now accommodate the additional production from several smaller mines nearby, and it was anticipated that gold and silver output would return to previous levels. The company continued to investigate deposits at Divisadero and Gigante.

Commerce Group Corp. encountered difficulties in maintaining economic gold ore reserves at its San Sebastián mine in La Union Department and continued exploration for additional reserves. Bruneau Mining Corp., a subsidiary of Rosario Resources Corp., continued its exploration studies at the old El Dorado gold mine in Cabañas Department.

The iron industry operated well below capacity in 1977. Even so, one company, Borgonovo Group, initiated studies of the Central American market for expansion feasibility. The following companies are involved in producing iron ingots and products:[2] Aceros S.A. (Borgonovo Group), with an annual capacity of 30,000 tons of iron products, mostly construction rods and wire; Corp. Industrial Centroamericana S.A. (CORINCA), with an annual capacity of 30,000 tons of iron rods for construction; Siderúrgica Salvadoreña (Tinetti y Cía.), with an annual capacity of 25,000 tons of iron rods for construction and tools; and Siderúrgica Centroamericana del Pacífico,

Digitized by Google

S.A. (Borgonovo Group), with an annual capacity of 100,000 tons of iron ingots, inaugurated in January 1977 to supply ingots to Aceros and to other Central American founderies, primarily Guatemalan.

Power generation continued to receive priority Government attention during 1977, and El Salvador claimed to be on the verge of self-sufficiency. In February, the 135-megawatt, Cerro Grande hydroelectric plant opened. Financing was secured for the San Lorenzo hydroelectric plant, a 165-megawatt facility to be constructed on the Lempa River. Approval was given for installation of the final 35-megawatt unit at the Ahuachapán geothermal power station. A Japanese company, Fuji Electric Co., Ltd., will construct the unit; installation was scheduled for 1979. The Ahuachapán station will then have a 95-megawatt capacity.

Additional geothermal power capacity was actively pursued through the investigation of sites for two 35-megawatt plants. Two sites in western El Salvador, Toles and Chimilapa, have been tested; two other western sites, Berlín and Chinameca, and two centrally located sites, San Vicente and Parras Lempa, are under exploration. The Comisión Ejecutiva Hidroeléctrica del Río Lempa (CEL) has responsibility for geothermal development.

GUATEMALA[3]

Guatemala's basic policy toward the development of its mineral resources continued to be one of realizing maximum benefits without committing national funds to investment capital. The Government benefits accrue from foreign exchange revenue, added-tax revenue, employment, and the December 1975 revision to petroleum legislation that granted to the State 55% of all production as well as the first option on the purchase of the remaining production.

Reconstruction requirements resulting from the 1976 earthquake have added to the chronic cement shortage. Needs are estimated to be about 30,000 bags per day more than current production capacity. In 1977, Guatemala imported cement from El Salvador and Mexico. New cement plant construction and expansion of existing plants will not afford relief until 1979.

Following 4 years of construction and an investment of $231 million, Exploraciones y Explotaciones Mineras Izabal S.A. (EXMIBAL), inaugurated its new nickel laterite mine and pyrometallurgical process plant on July 12, 1977. The plant is located on the northwestern shore of Lake Izabal near the town of El Estor in eastern Guatemala. At full capacity, the plant will produce 25 million pounds of nickel per year in the form of 75% nickel matte.

The EXMIBAL nickel deposits are of the lateritic type, and are the product of the weathering and residual concentration of nickel from olivine-rich peridotite rocks. Ore-quality material grading 1.5% to 2.2% nickel occurs in a rubbly saprolitic zone of decomposed bedrock, overlain by an average overburden of 8 meters of subeconomic limonite grading 1% to 1.7% nickel. Nickel reserves are scattered on eight separate deposits around the lake. Reserves at the La Gloria mine and at the Manto 4 and Amates areas on the north and northwest of Lake Izabal are more than adequate to maintain a plant feed of 670,000 tons of 1.95% nickel ore per year for 20 years. Similar quality reserves are also indicated in the Cristina, Trincheras, and Cerro Colorado deposits on the south side of the lake. Total resources at a lower average nickel grade can be inferred to be substantially larger.

Processing of the EXMIBAL ore involves conversion of the nickel oxide and silicate lateritic ore to a sulfide form, produced by injecting sulfur into a 100-meter-long, 5.5-meter-diameter reduction kiln. The sulfide product is then amenable to a more conventional pyrometallurgical treatment in a 45,000-kilovolt-ampere electric furnace and two 7.6-meter-long, 4-meter-diameter standard converters. The finished matte, assaying about 75% nickel, 22% sulfur, and 1% iron, will then be granulated and dried for marketing. Commercial level operation is expected to begin in 1978. The matte will be shipped to the Inco Ltd. refinery at Clydach, Wales. Inco, a Canadian company, holds an 80% interest in EXMIBAL, and Hanna Mining Co. of the United States owns 20%. According to the terms of a 1971 agreement, over the next 10 years the Guatemalan Government will acquire a 30% interest in EXMIBAL. This acquisition will be financed by EXMIBAL with a 50% waiver of its income tax exemption during the first 5 years of operation and a 25% waiver during the next 5 years.

Basic Resources International S.A. continued to be active in Guatemalan mineral development. The company holds a nickel concession west of EXMIBAL's operation but has not initiated development procedures. Through its subsidiary, Minas de Oxec S.A., Basic Resources operated the Oxec underground copper mine west of Lake Izabal. Ore reserves were estimated at 750,000 tons averaging 2.6% copper. The 400-ton-per-day concentrator produced about 13,071 tons of copper concentrate in 1977, all of which was shipped to Spain for refining.

In 1977, Basic Resources joined Veitscher Magnesitwerke AG of Austria to form an equally owned subsidiary, Magnesite International Bahamas, Ltd. The newly formed company will develop 7 million tons of proved and probable magnesite ore reserves located north of Lake Izabal at Minas Saquipec. The ore has been reported as containing 40% to 45% magnesite. By using open pit mining methods, the company expected to process 300,000 tons of ore per year to produce some 30,000 tons of dead-burned magnesite. No date has been given for startup of production.

The Guatemalan and Japanese Governments joined in a cooperative search for zinc deposits. The exploration was concentrated in a 14-square-kilometer area in the

Digitized by Google

Huehuetenango and Quiché Departments of southwestern Guatemala, where completed geological and geochemical surveys were to be augmented by topographic mapping and drilling. Minas y Minerals Centro America has also been investigating the zinc potential east of the town of Huehuetenango. This small private company was reported to have installed a 60-ton-per-day zinc concentrator and was investigating veins near the old Almengores mine.

The Government proceeded with its program to exploit hydroelectric and geothermal resources. By 1982, the Chixoy hydroelectric project on the Chixoy River will add 300 megawatts to Guatemala's hydroelectric capacity, more than doubling 1974 capacity. The Instituto Nacional de Electrificacíon (INDE) investigated several geothermal sites, two of which were expected to produce temperatures of 200° C at a 1,500-meter-depth. One of these sites is located near Lake Amatitlán south of Guatemala City, and the other is at Zunil in the western highlands.

The Shenandoah Oil Corp. and Basic Resources joint petroleum venture expanded its area of exploration to include three new areas: Chinajá Field, located some 19 kilometers northeast of Shenandoah's 1976 Rubelsanto Field discovery; the Chisec anticline, located some 13 kilometers south of Rubelsanto; and the Rio Xalbal Field, located 56 kilometers west of Rubelsanto. The well drilled at Chisec was abandoned after testing noncommercial amounts of oil. Further drilling depended on an evaluation of the data obtained. The Rio Xalbal test was abandoned after mechanical difficulties. The Chinajá well found production in three zones. The lowest zone, 6 meters thick and 1,160 meters deep, produced 3,300 barrels per day of 32.30 API gravity oil with no water; the middle zone, 4 meters thick and 1,110 meters deep, produced 3,250 barrels per day; and the shallowest zone, 4.5 meters thick and 1,038 meters deep, tested 2,000 barrels per day. Natural gas from the three zones in this well tested at 3.3 million, 3.8 million, and 0.72 million cubic feet per day, respectively. Seismic and geologic data on the Chinajá Field led to speculation that the structure may be larger in size and greater in formation porosity than the producing zone in Rubelsanto Field. Further testing was planned for 1978. The Government planned to offer exploration contracts for new areas in the northwestern highlands.

Private Guatemalan interests operating as Central American Pipeline Co. (CAPICO) have proposed construction of a 48-inch pipeline and port and storage facilities to transport Alaskan North Slope and Indonesian crude from the Pacific Ocean to the Caribbean Sea. CAPICO negotiations with the Government for approval of the project continued throughout 1977.

HONDURAS[1]

No changes were made during 1977 in the Honduran tax law decree, which has discouraged private investment since its passage in December 1975. In April, Canada began an aid program to assist Honduras in organizing its minerals regulatory and development efforts. The mineral industry contributed about 5% to the gross national product (GNP). The major minerals produced were gold, lead, zinc, antimony, and cadmium.

Rosario Resource's El Mochito mine was the only substantial active mining operation in Honduras. In 1977, the mill processed 325,875 tons of ore, a modest increase of about 5,000 tons over that of 1976. Metal content gradations within the ore body at the different mining levels resulted in lower silver and lead production but an increase in zinc production. For 1977, Rosario Resources reported production of 2,818,515 troy ounces of silver, 1,990 troy ounces of gold, 20,604 tons of lead, and 26,542 tons of zinc from the El Mochito mine. Mining and milling capacity expansion to about 1,400 tons per day was to be completed in 1978, and Rosario Resources anticipated that it would then have a more cost-effective operation, an important factor in light of high Honduran taxes, increasing infrastructural and milling costs, and fluctuations in the metal markets.

A Japanese firm, Hibino Metal Industrial Corp., expressed interest in assisting the many small antimony mines in western Honduras. The company has made occasional spot purchases of antimony from these operations but reportedly would like to establish a long term supply source for perhaps 3,600 tons per year of antimony in

Digitized by Google

concentrates.

A new 60,000-ton-per-year-capacity steel-mill was opened by Aceros Industriales S.A., and consideration was being given to establishing a 60,000-ton-per-year scrap iron furnace. Other mineral development prospects for coal, iron ore, and marble remained in investigative or assessment phases of consideration.

Geonomics Inc., a California company, contracted with Empresa Nacional de Energía Eléctrica (ENEE) to carry out a $750,000 investigation of geothermal resources in five areas of Honduras. The areas cover approximately 10,000 square kilometers and include Choluteca, San Ignacio, Comayagua, Balfate-La Ceiba, and La Masica. It was anticipated that field work would be completed early in 1978.

In May, the Government revised those provisions of the Petroleum Law of 1972 dealing with granting concessions. The new regulations, set forth in Decree No. 457 dated May 11, 1977, required all concessions to be issued solely through public bidding. In August, the Government offered three concession blocks for international public bid. The blocks included some offshore Atlantic acreage. The awarding of concessions based on the bid response was expected to begin in early 1978.

No onshore drilling has been undertaken since Cía. Union Oil Co. of Honduras drilled in 1975. Early in 1977, prior to Decree 457, several companies received concession rights for petroleum exploration. Esso Standard Oil, S.A. Ltd. was granted four offshore blocks, and Anschutz de Honduras S.A. secured one onshore and one offshore block in addition to its one previously granted offshore block. Esso Standard agreed to operate the Anschutz concession and conducted an aeromagnetic survey. Signal Exploration and Development Co., Union Oil, and Phillips Petroleum Co. relinquished a total of 11.5 million acres of offshore permits during 1977.

The Governments of Honduras and Nicaragua continued their negotiations over an official boundary line between the two countries in the Caribbean Sea.

NICARAGUA[1]

The mineral industry remained a minor factor in the overall economy of Nicaragua, and aside from the major companies already established, there was little interest on the part of investors to initiate new projects. Production of gold, silver, lead, and zinc all decreased substantially from 1976 levels, a downward trend that has been evident for some 20 years.

Inflows of hot, underground water continued to present major problems at the Limón mine operated by Empresa Minera de El Setentrión, in which the Canadian company Noranda Mines Ltd. holds a 60.5% interest. Efforts were directed toward sinking a new shaft in an attempt to dewater the flooded areas, which unfortunately contain El Setentrión's higher grade ore (0.44 troy ounce of gold per ton). Until controls are established, the company remains restricted to working lower grade ores. In 1977, the company treated 132,000 tons of ore averaging 0.38 troy ounce of gold per ton. El Setentrión produces a finely disseminated ore that requires grinding to 200 mesh to yield 92% to 93% recovery.

Neptune Gold Mining Co., owned by ASARCO Incorporated(51.5%)and Rosario Resources (36.5%), produced silver, gold, lead, zinc, and copper from its mines in the Rio Pis Pis area. Vesubio, the company's major mine, suffered cave-ins during 1977, and the resultant lost ore and pillars decreased reserves by 167,535 tons. Reserves of sulfide ore, grading 0.8% lead, 5.76% zinc, 0.42% copper, 1.00 troy ounce of silver, and 0.099 troy ounce of gold per ton, were estimated at 882,019 tons at yearend. Gold ore reserves were estimated at 55,431 tons grading 0.397 troy ounce of gold per ton.

Rosario Mining of Nicaragua, wholly owned by Rosario Resources, continued underground development at the Riscos de Oro and Blag gold-silver mines near the old Rosita open pit copper mine in Zelaya Department, about 34 kilometers southeast of Neptune's operations. By yearend, about 520 meters of horizontal development had been completed at Riscos de Oro, and the shaft at Blag was deepened 98 meters; stoping was initiated at both mines. Estimates of ore reserves were reduced at both mines owing to unfavorable results from development work. Ore from all of Rosario's mines is milled at the Rosita mill, which was converted from a 1,800-ton-per-day copper flotation unit to a 450-ton-per-day cyanide mill, with a standby provision for base

Digitized by Google

metal sulfide flotation. Introduction of surface ore from the La Luna open pit mine caused temporary operational problems at the mill, but by yearend, the plant reached 80% capacity. Rosario's proven and probable ore reserves at yearend totaled 166,229 tons grading 8.69 troy ounces of silver and 0.193 troy ounce of gold per ton. In 1977, Rosario milled a total of 73,174 tons of ore, producing 119,394 troy ounces of silver and 6,918 troy ounces of gold.

Some smaller gold-milling expansion projects were underway during 1977, by Minas de Cerro Dorado Ltd. at its Santa Rosa mine and by LeMans Resources at the La Libertad mine.

Nicaragua has an active geothermal power development program. Empresa Nacional de Luz y Fuerza (ENALUF), the national energy company, has drilled and capped 20 geothermal wells at the foot of the Momotombo Volcano located on the shore of Lake Managua. Bids have been requested for a 35-megawatt electric powerplant, with completion planned for the first half of 1980. Additional capacity is planned for 1981-82 if sufficient geothermal fluids are available.

No commercial petroleum or natural gas resources have been found in Nicaragua, although several companies were actively exploring offshore. Union Oil Co. of Central America initiated a three-well drilling program offshore near Puerto Cabezas. Occidental Petroleum Corp. spudded an offshore well near the Quita Sueño Bank, but no further information was made available. Texaco Caribbean Inc. assigned Amerada Hess of Nicaragua a 50% interest in its offshore exploration permits in the Punto Mico, Maiz Grande, and Maiz Pequeño areas. Texaco and Amerada Hess, in a joint venture, planned to drill in the Caribbean off the coast of southern Nicaragua in 1978. Rosario sought a partner to explore its 1.4-million-acre concession option in northeastern Nicaragua. Its 1976 seismic program indicated several favorable structural anomalies.

PANAMA[3]

After the 0.6% growth in the real gross domestic product (GDP) in 1975 and the more discouraging zero growth in 1976, Panama's 1.6% growth in 1977 offered a small but welcome measure of encouragement, although it was still well below the Latin American average growth of 5%. The new Panama Canal Treaty and the estimated $65 million to $70 million in direct annual payments that will accrue after the treaty becomes effective in 1979 will enable Panama to negotiate greater international borrowing for development purposes. Active mineral production in Panama during 1977 was limited to salt, limestone, sand, gravel, cement, and clay.

Panama has been the site of the discovery of at least two significant copper deposits in the past 10 years. The location and geological setting of the Cerro Colorado, Petaquilla, and several smaller copper prospects were described by Kesler.[4] These copper

Digitized by Google

deposits are the object of both Government and private engineering and financial feasibility studies and could play a major role in Panama's future mineral and economic development plans.

The Cerro Colorado deposit, with latest reserve estimates reporting the presence of 1.4 billion tons of ore grading 0.78% copper and 0.01% molybdenum and a total resource potential of up to 3 or 4 times this tonnage, is one of the largest undeveloped copper deposits in the world, surpassed possibly only by the huge Udokan deposit in the U.S.S.R. The deposit also contains an average of 0.003 troy ounces of gold and 0.16 troy ounce of silver per ton.

State-owned Corp. de Desarollo Minero Cerro Colorado, in which Texasgulf Inc., holds a 20% minority equity participation, was established to develop the Cerro Colorado deposit. Texasgulf is under contract to manage the feasibility study, design, construction, and operation of the project and was scheduled to complete the detailed evaluation study for the Government by May 1978. Panama is still seeking outside financial support to cover the cost of the project, estimated at $800 million to $1.2 billion.

Cerro Colorado infrastructure plans include a road, port facilities, and freshwater supplies. The open pit mine and adjacent concentrator would operate at a capacity of up to 27 million tons of ore per year, with smelter output calculated at 182,000 tons of blister copper per year. The smelter would be located at the port, approximately 63 kilometers from the mine. The study included a phosphoric acid plant to utilize sulfuric acid from the smelter operation. The plant would produce about 266,000 tons per year of phosphoric acid. Panama planned to construct a large dam and powerplant at La Fortuna to serve the Cerro Colorado operation.

Panama Copper Co., a subsidiary of Mitsubishi Metal Corp. (Japan), was evaluating its feasibility studies of the Petaquilla porphyry copper deposits, located in the Donoso District in the western part of Colón Province. It was estimated that the deposits contain as much as 300 million tons of ore averaging 0.7% copper.

To the west of Cerro Colorado, the Chorcha copper deposit was under study by Asarco; no details were available. Development of these Panamanian copper resources are dependent on both the availability of capital and the prospects of more favorable copper market conditions in the 1980's.

In September, a U.S. company, Northville Industries Corp., agreed to join the Government in the $47 million construction of a 2.5-million-barrel oil transshipment and storage terminal. The Panamanian Government acquired a 25% interest in the venture, called Petroterminal de Panama S.A., and granted Northville exclusive transshipment rights for 20 years. Alaskan crude oil in Very Large Cargo Carriers would be offloaded at Puerto Armuelles, stored, and reloaded into smaller tankers for transport through the Panama Canal to U.S. gulf coast and east coast refineries.

There was no petroleum exploratory drilling in Panama during 1977. Texaco Inc.'s subsidiary Panama Exploration Inc. expected to drill in 1978. The company signed a farmout agreement assigning 50% of its 1.2 million acres of offshore concession to Amerada Hess Corp. of Panama. The concession is located in the Golfo de los Mosquitos in the Caribbean. The Government would share in any production from development of the concession.

BANGLADESH[1]

Mineral production was of little significance in the country's economy, and Bangladesh was not a world-ranked producer of any mineral commodity during 1977. Natural gas was the most important mineral exploited; however, reserves were sufficient to allow for much greater production.

Economically, Bangladesh made some progress in 1977-78[2] in its struggle against poverty, underdevelopment, and rapidly increasing population. The gross domestic product (GDP) grew 8%, mainly owing to a 13% increase in food grain production, the key economic indicator in this highly agricultural nation. GDP at current prices dropped slightly in Fiscal Year (FY) 1976-77 to $6.6 billion[3] and rose to $7.2 billion in FY 1977-78. The population rose from 81 million in FY 1975-76 to about 85 million in FY 1977-78, resulting in an increase of per capita GDP from $83 to $85 during the same period. The high annual population growth rate, over 3% in 1976 and about 2.8% in 1977, was recognized by the Government as the main problem facing the country. Average density was 525 people per square kilometer. A similar density would have the entire world population living within the continental United States.

Exports rose from $381 million in FY 1975-76 to $422 million in FY 1976-77 and to $497 million in FY 1977-78. Minerals played virtually no part in export revenue, with jute, jute products, and tea accounting for nearly all of the value. Imports dropped from $1,265 million in FY 1975-76 to $865 million in FY 1976-77, but increased again in 1977-78 to $1,274 million.[4] Imports were mostly raw materials, industrial goods, and food grains. Most of the $775 million trade gap has to be met with foreign aid, which continued to be a basic weakness of Bangladesh's economy. Prudent fiscal policies have kept inflation between 10% and 15% during the last 2 years. Private domestic and foreign investment grew satisfactorily in FY 1977-78 because of favorable government policies, but the amount remained small compared to the need.

On the negative side, rural and urban

Digitized by Google

poverty have increased drastically since the 1960's, and over one-half of all families are malnourished in terms of minimum calorie intake. Per capita food production and the gross national product (GNP) have not recovered to 1970 levels. Approximately 38% of the labor force of 29 million was unemployed or underemployed, and the number of job seekers was growing twice as fast as new jobs were created.[5]

The Government's policy was actively encouraging new industries in the less developed and nonmetropolitan areas. Import duties and taxes were cut significantly, a higher debt-equity ratio was allowed, and lower electric power and transportation costs were offered. Small-sized and agro-based industries were particularly welcome. Further development in the metropolitan areas of Dacca, Chittagong, and Khulna was restricted by zoning and financial disincentives.[6]

Natural gas was the only significant mineral commodity produced in Bangladesh during 1977. Production during the year was just under 1 billion cubic meters (100 million cubic feet per day). Utilization of natural gas in Bangladesh was low compared with many other countries. Total proved reserves of seven fields were reported to be at least 235 billion cubic meters. The ratio of current production to reserves was about 0.004. This ratio for India and Pakistan is more than 3.3 times larger; for Brunei, 6.6 times larger; and for industrialized West Germany, nearly 20 times larger. It was estimated that just the present proved fields could support a production of eight times the current rate.

There have been discussions with several countries on the possibility of increasing utilization by setting up an export-oriented liquefied natural gas (LNG) plant at Chittagong using the reserves found at the Bakhrahad discovery, southeast of Dacca. However, there were no firm projects in the offing at the end of 1977. Because of the extreme cost involved, and the possible environmental considerations in several prospective client countries, the outlook for the construction of the plant must be considered as a very long-term possibility.

The domestic breakdown of gas utilization in 1977 was as follows: Production of fertilizer, 48%; electric power, 36%; cement, 4%; other industries, 9%; and commercial and domestic usage, 3%.

Petroleum exploration in the offshore areas met with mixed success during the year. Drilling offshore 96 kilometers southwest of Chittagong in shallow water, Union Oil Co. of Bangladesh struck natural gas at about 2,670 meters. The well, designated Kutubdia No. 1, tested 500,000 cubic meters per day of good quality dry gas.

The Yugoslav offshore exploration firm INA-Naftaplin and its partner Texas Pacific Oil Co., Inc., drilled the only other hole during the 1977 drilling season. The hole lost drilling fluids at 4,267 meters and drilling was terminated well above the target formation. A production test was made at the 3,660-meter level but it showed nothing and the hole was plugged and abandoned. Last year, extreme pressure at about the 4,200-meter level forced abandonment of INA's first hole in this same concession area.

Bengal Oil Development Co. of Japan was scheduled to begin drilling a deep test offshore early in 1978. By yearend 1977, four of the six companies that once held offshore drilling contracts (Atlantic Richfield Co., Ashland Oil Co., INA-Naftaplin, and Superior Oil Co. of Canada) had terminated their contracts. Onshore, production testing was done on the 1976 gas discoveries at Hijla-Muladi No. 1 and Begumganj No. 1. The results of the testing were not certain.

Bangladesh has found no crude oil in the country and continued to be dependent on petroleum imports for much of its energy needs. Crude oil imports for FY 1976-77 were 1.1 million tons, all of which came from Abu Dhabi or Iran. It was refined in the country's only refinery, at Chittagong. An additional 225,000 tons of various petroleum products were also imported from a variety of countries.

Other than natural gas production, the mineral industry contributed very little to the Bangladesh economy, but several projects were planned that would add to the country's mineral output. Cement production was 323,000 tons in 1977, a 40% increase over the 230,000 tons produced in 1976. This was produced by the Chhatak cement plant, which used local raw materials, and the new Chittagong clinker grinding plant, which used imported clinker. Implementation of an ambitious plan for cement self-sufficiency was delayed for lack of financing. The plan envisioned a limestone mine and clinker production plant to be set up at Jaipurhat in the Bogra district. The clinker plant would supply 1,000 tons per day to the Chittagong plant and 1,000 tons per day to a proposed grinding plant at Khulna. The final stage would be an additional 1,000 tons per day cement plant at Jaipurhat. Completion of the project would meet all of Bangladesh's domestic cement

Digitized by Google

requirements for several years.

A large occurrence of granite gneiss rock suitable for all types of construction work was identified at Ranipukur near Madhyapara in the Dinajpur district. The Government was interested in developing a 1.7-million-ton-per-year quarry at the deposit and was trying to arrange financing for the project. Bangladesh's construction sector is a large potential market for hard-rock building materials. Its present needs are supplied by high-priced brick or rock from riverine boulder deposits at Bholaganj in the Sylhet district.

A white clay mine was under development in Bijaipur. The project produced a small amount of clay during the construction period. Output was scheduled to be 3,500 tons per year when the mine goes onstream.

Work begun in 1976 continued on the Ashuganj nitrogenous fertilizer plant. Problems with site preparation caused delays early in 1977, but construction continued satisfactorily at yearend. The plant will produce 925 tons per day of ammonia and 1,600 tons per day of urea, and use natural gas as feedstock and fuel. The plant is sited on the Meghna River, about 64 kilometers northeast of Dacca.

Bangladesh currently uses natural gas to produce nitrogenous fertilizers from plants in Ghrashal and Fenchuganj, which have a combined capacity of 191,000 tons per year nitrogen content. Technicians from Mainland China were conducting a feasibility study during the year for building a small nitrogenous fertilizer plant at Ghorashal, adjacent to the existing one.

Plans were made for the construction of a large ammonia/urea plant at Chittagong. The plant would require a pipeline from the undeveloped Bakhrabad gas discovery near Dacca. This plant would be set up instead of the more expensive and controversial LNG plant. As in the cement industry, financing of the project will be a major consideration in whether it becomes a reality.

[e]Estimated. [p]Preliminary. [r]Revised. NA Not available.

[1]In addition to the countries listed individually in this table, Nepal, covered textually in this chapter, presumably produces a variety of crude construction materials such as clays, stone, and sand and gravel, and may produce cement, but production statistics are not available and general information is inadequate to make reliable estimates of output levels.

[2]In addition to the commodities listed, a variety of crude construction materials such as clays, stone, and sand and gravel presumably were produced, but production statistics are not available and general information is inadequate to make reliable estimates of output levels.

[3]May include other clays.

[4]Data for years ending June 30 of that stated.

[5]As reported by United Nations.

[6]Gross production not reported; the quantity vented, flared, or reinjected is believed to be negligible.

[7]Revised from zero.

[8]In addition to the commodities listed, iron ore and lead-zinc ores were mined in the past, and the country produced pig iron, crude steel, and smelter zinc from its industrial facilities, but the status of these industries under prevailing conditions is not sufficiently clear to permit preparation of reliable estimates of output. Similarly, no data on crude construction materials are available and no reliable basis for estimation is available.

[9]Based on import statistics of the U.S.S.R. and Japan.

BRUNEI[7]

Brunei was one of the world's largest exporters of LNG and an important South Asia exporter of crude oil in 1977. There was no other commercially important production of mineral commodities in the country.

The year ending December 1977 was one of unprecedented prosperity for Brunei owing to its oil and natural gas production. Exchange rate fluctuations, which had caused problems in recent years, were less noticeable in 1977 because overseas investments had been diversified and changes in currency rates were not so dramatic as in past years.

The gross domestic product increased nearly 12% to an estimated $1.65 billion.[8 9] The country reportedly earned nearly $900 million in 1977 and expected the figure to rise to over $1,000 million in 1978. Government earnings were derived mainly from royalties, dividends, and taxes from the production of oil and natural gas. A small amount of income was derived from the sale of rubber and timber. Recurring Government expenditures were anticipated at $385 million in 1978 and an additional $69 million was to be put aside for development projects. The Government thus stood to have a sizable surplus in 1977 and probably again in 1978. It was reported that the treasury had an accumulated revenue fund surplus of over $2.13 billion at the end of 1977.[10]

During the year, the Government increased its holdings in the Brunei Liquefied Natural Gas Co., Ltd. (BLNG), from 10% to 33-1/3%. Brunei Shell Petroleum Co. Ltd., Mitsubishi Co., and the Brunei Government each holds one-third interest in the plant.

The Brunei Government planned to diversify the economy by developing industries other than oil and gas. Possible alternatives are a wood pulp and paper plant or an oil palm plantation, both still in the planning stages.

A project by the Government to provide modern health services for the people got underway in mid-year. It was the construction of a large well-equipped hospital complex, estimated to cost about $32 million in 1977. The final cost, however, may be over $42 million.

COMMODITY REVIEW

Petroleum and Natural Gas.—Crude oil production averaged about 213,000 barrels per day during 1977. Virtually all production was exported because domestic consumption was insignificant. Brunei Shell Petroleum Co. and its equal partner, the Brunei Government, produced petroleum from four offshore fields and one onshore (Seria) during 1977. Southwest Ampa field was the largest producer, with about 92,000 barrels per day. Total amount of crude produced in 1977 was nearly 77 million barrels (10.4 million tons) valued at about $1.1 billion. Production was 3% more than in 1976, but its respective current value was 16% more because of world price increases for crude oil.

The 56-kilometer oil pipeline from the Seria oilfield to the loading port at Lutong across the border in Malaysia was formally closed. Exports are now handled by local loading equipment at Seria.

A modest amount of drilling took place during the year, mostly development work at old fields and at small new offshore discoveries. It was reported that some deep onshore wells would be drilled in 1978. The drilling program was designed to develop enough new production potential to maintain present production levels. Output at Seria will probably begin to taper off soon, since the field has produced almost continuously for the past 50 years. Seria produced over 860 million barrels of oil (116 million tons) during that period.

The Brunei LNG Co. Ltd. facility, located on the coast at Lumut, was the largest fully operational LNG plant in the world. The final liquefaction line was completed in mid-1976 and the plant has operated at more than its 5-million-ton-per-year design capacity since then.[11]

Gross natural gas production was 9.8 billion cubic meters in 1977. Marketed gas totaled 7.6 billion cubic meters, a 5% increase over that of 1976. The gas was processed through the BLNG plant and exported 5.3 million tons in special 75,000-cubic-meter-capacity tankers. The entire output, valued at an estimated $588 million, went by contract to Japan.

HONG KONG[12]

Hong Kong's GDP in 1977 was estimated at US$5.6 billion in constant 1966 prices, compared with $5.1 billion in 1976.[13] Services accounted for 44.0% of the GDP in 1977, followed by manufacturing, 25.0%; agriculture, 1.6%; mining, 0.1%; and other, 29.3%. The British Crown Colony relies almost wholly on foreign raw materials to meet the needs of its population and the requirements of its industries and service-oriented businesses. Aside from tourism, light industries dominate the local economy, which is dependent on sales and shipments of export goods. Production of textiles and clothing, electronic articles, plastic products, watches and clocks, and other consumer articles account for over 76% of the value of the Colony's total domestic export. Moreover, over 69% of the total industrial work force is employed in these sectors.

Because of increasing competition from export-oriented countries in the region, Hong Kong's industries continued to modernize operations and to move into more sophisticated product lines. On March 1, 1977, the Hong Kong Industrial Estates Corp. was established by statute to plan industrial development, minimizing land-use conflicts. By yearend, 15 hectares of land became available for subleasing at the Tai Po Industrial Estate; when completed in 1980, the total area will be 45 hectares. Other estates were planned for Yuen Long, Tsing Yi, and Kwai Chung. Five special industry projects were granted land in Tsing Yi: A machinery plant, textile auxiliary chemical production, and three shipyard projects. At Kwai Chung, land was made available for container maintenance and repairing service; also, applications for chloralkali manufacture, industrial gas production, and food processing were under consideration.

Mainland China ranks after Japan as Hong Kong's major supplier for imports. In 1977, total imports from China amounted to $1.7 billion. While Hong Kong has been a prime outlet for Chinese goods, it was expected that the Colony would assume an even more important role. At yearend 1977, China was estimated to have $2 billion worth of investments in Hong Kong. Far East Overseas Oil Co. Ltd. has about a 2.4-million-barrel storage capacity for Chinese oil as well as tanker port facilities in Hong Kong. Because of its location and logistic advantage, the Colony could be the regional headquarters for the development and marketing of Chinese oil as well as a center for exporting technology to China.

China Light and Power of Hong Kong was negotiating the purchase of power equipment for construction of a coal-fired powerplant in the New Territories. China was expected to supply up to 3.5 million tons per year of coal by the late 1980's in return for electricity exported to Kwangtung.

PRODUCTION

Minerals mined and produced in Hong Kong included beryl, feldspar, graphite, iron ore, kaolin, quartz, cassiterite, and wolframite. By 1977, mine production in the Colony was limited to feldspar, kaolin, and quartz. The New Territories Mining Co., Ltd., which operated the Ma On Shan iron ore mine, suspended operations in April 1976 owing to low-grade ore and the depressed world market for iron and steel.

At yearend, the total land area covered by prospecting and mining licenses and mining leases totaled about 397 square kilometers: There were two prospecting licenses (kaolin and quartz); eight mining licenses (feldspar, kaolin, and quartz); and three mining leases (feldspar, iron ore, quartz, and wolframite). Revenues from mining, prospecting fees, and royalties were $9,280 in 1977 compared with $64,135 in 1976. The number of mines extant in 1977 included three for feldspar, one for iron ore (inactive), six for kaolin, and four for quartz. No fatalities were reported for the mining and quarrying sector during the year; however, 124 injuries resulted from accidents, of which 8 were in mining and 116 in rock quarry operations.

TRADE

Hong Kong's total two-way trade was $20.2 billion in 1977, composed as follows: $10.5 for imports, $7.7 for domestic exports, and $2.1 for reexports. The Colony's major trading partners were the United States ($4.4 billion), Japan ($3.1 billion), Mainland China ($1.7 billion), and the United Kingdom and Federal Republic of Germany ($1.1 billion each). Major mineral-related imports included mineral fuels and lubricants ($648 million); nonmetallic mineral manufactures ($711 million); and iron and steel ($296 million), compared with domestic exports of metalliferous ores and metal scrap ($35 million); nonmetallic mineral manufactures

Digitized by Google

($51 million); iron and steel ($4 million); and manufactures of metal ($215 million).

Exports of kaolin to Japan and Taiwan in 1977 totaled 3,120 tons, valued at $109,244; exports of feldspar to Japan, Philippines, and Taiwan were 1,183 tons valued at $55,067. Iron ore shipments were all to Japan in 1976 and totaled 51,361 tons valued at $619,777. During 1977, Hong Kong imported 2,973 tons of quartz, 3,975 tons of feldspar, 1,344 tons of graphite, and 22,612 tons of kaolin clay.

COMMODITY REVIEW

Metals.—*Iron Ore.*—The Ma On Shan mine at Tide Cove opened in May 26, 1931. Iron ore and some wolframite were produced from this 640-acre mine site. In April 1976, the New Territories Mining Co., Ltd., suspended operations at the mine because of the depressed world market for iron and steel. However, at yearend, 40 persons were reportedly still employed by the company, which holds a mining license valid until 1981.

Tungsten.—Yan Hing Mining Co., Ltd., was holder of a mining lease issued on May 9, 1957, and valid for 21 years, for the Needle Hill tungsten mine, covering 540 acres. Mining was suspended at the end of 1967 because of the low market price of tungsten ore and the rising cost of skilled labor. Subsequently, Yan Hing's holding was reduced to 288 acres following the surrender of land to the Hong Kong Government for construction of the lower Shing Nun Reservoir in 1961. In 1977, Yan Hing completed a feasibility study on reopening the mine; the study concluded that Needle Hill was workable for 15 years, provided the price of tungsten ore remained steady. The company has applied to the Land Officer for a renewal of its mining lease to reopen Needle Hill.

Nonmetals.—*Feldspar.*—During 1977, 3,378 tons of feldspar was produced by the Hong Kong Clays and Kaolin Co., Ltd. mine at Cha Kwo Ling, which covers 19 acres. Mine output also included some kaolin. Previously, feldspar was produced at Tung Lo Wan (Sha Tin) and at Needle Hill. During 1977, 1,183 tons of feldspar was exported to Japan, the Philippines, and Taiwan; 1,179 tons was shipped for local sale; and 3,975 tons was imported.

Kaolin.—In 1977, kaolin mine production totaled 2,466 tons: 3,120 tons was exported to Japan and Taiwan; 378 tons was shipped for local sales; and 22,612 tons was imported for consumption. In addition to the feldspar (and kaolin) operation at Cha Kwo Ling, there were five kaolin mining licenses in force during 1977 covering 25.2 acres: Two at Pillar Point, Castle Peak (5.8 acres); two on Tsing Yi Island (6.7 acres); and one at Deep Bay, Yuen Long (12.7 acres). During 1977, one prospecting license, issued on July 10, 1975, was in effect for kaolin prospecting on 7.2 acres on Chek Lap Kok Island.

Aggregates.—Consumption of aggregates (predominantly quartz) runs 7 to 8 million tons per year in addition to about 1 million tons of sand dredged from marine sediments. Cha Kwo Ling Quarry is the largest in the Colony and has an output capacity in excess of 1.5 million tons per year. Shek O Quarry, operated by the Pioneer Group of Australia, has an output of about 1 million tons per year. Other large quarries include Diamond Hill and Kwo Ling, the former supplying all the bituminous materials required by the Colony's Highway Department.

DEMOCRATIC KAMPUCHEA[14]

Output by the mineral industry contributed very little to Kampuchea's[15] largely agrarian economy in 1977. Kampuchea was not ranked as an important world producer of any mineral. A variety of minerals might be developed given a thorough exploration effort using modern geophysical and geochemical surveying techniques. The only significant minerals that have been produced were phosphate rock, gems, salt, and nonmetallic construction materials for cement, brick, and tile manufacture. No mineral production figures were available for the year.

Bauxite was known to occur in commercial quantity, but development plans were at a standstill. In addition, deposits of copper ore, coal, gold, iron ore, and manganese ore reportedly have been identified.

Economic data for Kampuchea were scarce. The latest estimate for gross national product was $590 million in 1975. Limited

Digitized by Google

exports to Hong Kong resumed in 1976. In 1977, Hong Kong, Singapore, and Japan began purchasing small amounts of agricultural products from Kampuchea, probably totaling collectively less than $1 million in value. Imports from these same countries increased from about $2.5 million in 1976 to around $19 million in 1977. Imports consisted mostly of pharmaceuticals, insecticides, textile yarns, petroleum products, machinery, and replacement and spare parts.

It was also presumed that Mainland China and possibly some other countries provided assistance by furnishing machinery and spare parts, steel semimanufactures, foodstuffs, fertilizer, and farm materials.

Irrigation and water conservation projects received high priority during the year in an effort to maximize rice production. During the 1977 dry season, reservoirs and canals were reportedly completed with an aggregate capacity of 2.8 billion cubic meters. A total of at least 250,000 hectares of land was brought under year-round irrigation during the year.

Fighting erupted at yearend along the southeastern border between Kampuchean and Vietnamese troops. The plans for developing industry and for increased mineral exploration and exploitation undoubtedly were seriously disrupted because of the conflict.

COMMODITY REVIEW

Brick was produced from local clay minerals at several locations. No large plants were known to be operating during the year. A small plant at Phumi Prek Reang (probably 11°39' N, 104°53' E) in Kampong Spoe Province began operating at the end of 1975 and produced brick, roofing tiles, and a variety of earthenware containers. Production was to double in 1978. Other plants were being repaired and still others built around the country.

A glassware factory resumed operation at Boeng Cheung Ek (coordinates unknown) southwest of Phnom Penh in July 1977. The plant used local raw materials and was repairing a 6-ton and a 15-ton furnace to increase production of glass containers.

Kampuchea produces salt for domestic consumption from seawater evaporation. During the first 6 months of 1977, workers reportedly exceeded the quota by 70%.

Japan's first mineral-related trade contract with Kampuchea since the change of government in April 1975 was reportedly signed in February 1977. A Japanese company was to export 10,000 tons of rolled steel to Kampuchea. There were no integrated steel smelters in Kampuchea. However, crude iron foundries were operating at Phumi Srov Leu (10°42' N, 104°29' E), Phumi Trapeang Veng, Phum Chrak Kes, and in several other locations. These were locally made, batch-fired, charcoal-fueled furnaces. The charge consisted of various types of steel or iron scrap, additives, and some locally produced iron ore. While production was only on the order of 1-2 tons per firing, the product was reported to be a good grade of malleable iron. These smelters turned out plowshares and other agricultural tools, pots, pans, water pump parts, tools, metal fasteners, and replacement parts for a wide range of equipment.

The most important mineral commodity to the Kampuchean economy is currently phosphate rock, mined mainly at Tuk Méas (10°40' N, 104°34' E). Phnom Penh radio indicated that production increased during the year as ore-pulverizing equipment was repaired and improvised using any suitable material or device. The plant was relocated from near the city to the edge of the quarry to save on ore transportation costs. Production resumed in 1976 after the plant had been damaged in 1970. The plant was originally able to produce 12,000 tons per year (P_2O_5 content) of phosphate rock. While production is unknown, it is unlikely to have been more than a few thousand tons in 1977.[16]

In June 1977, a new phosphate fertilizer factory started operating at O Prasat commune in the Mongkól Borei district (13°28' N, 103°10' E). The plant had one rock crushing unit and seven pulverizing machines and reportedly was turning out 12 to 15 tons per day of fertilizer. If this production figure is correct, the plant would supply some of the needs of the northwest provinces and eliminate transportation costs from Tuk Méas.

Kampuchea produced no crude oil or natural gas during 1977, nor was there any known exploration conducted either onshore or offshore. The old French 12,000-barrel-per-day petroleum refinery at Kompong Som (10°38' N, 103°30' E) was damaged during the Civil War. It was not repaired during 1977 and the country's petroleum needs were satisfied by imports of finished petroleum products. The value of Kampuchea's petroleum imports from Hong Kong and Singapore reportedly rose to over $3 million in 1977.

LAOS[17]

During the second year of the new regime's operation, the People's Democratic Republic of Laos continued the struggle to become economically viable. A combination of devastating drought throughout much of the country and the absence of foreign aid upon which it has traditionally been dependent left Laos with little financial stability. Thailand controlled goods carried to and from Laos with blockade actions, which further affected the economy. The Government exchanged the old currency for the new liberation kip (K) in 1976 in an attempt to stop inflation. The inflation continued, however, despite the effort. At the time of exchange in June 1976, the U.S. dollar was worth K200. By the beginning of 1977, it had risen to K1,400 and, during the year, it rose to a high of K2,200 per U.S. dollar.[18] The GNP at market prices was estimated to be $257 million in 1977.

The Government's basic objective of attaining self-sufficiency in food production by 1980 received a serious setback in 1977. Owing to severe drought, the national rice harvest was 40% less than that of the preceding year, with some areas of the country as much as 95% less. Some effort was made to transplant seedlings to parts of the country less affected but with only limited success. A joint study by the United Nations Development Program with the Laos Agricultural Ministry stated that there would be widespread famine in the country if external aid were not permitted in the form of edible rice, seeds, and pesticides.

Another major goal of the new Government was the construction, improvement, and repair of the nation's roadways. Work went forward on these projects during 1977, with more than 500 kilometers of roads and 16 bridges being completed or restored. The roads between Laos and Vietnam remained poor. Plans for a new road and bridge link between Thailand and Laos were apparently dropped.

The hydroelectric station at Nam Ngum continued with phase 2 of its building program; expansion was scheduled to be completed sometime in mid-1978. Nearly one-half of the power from this plant was exported to Thailand during 1977. This mutually beneficial power-sharing arrangement has continued for years, despite the changing political conditions between the two countries. When the increased capacity (from 30 megawatts to 110 megawatts) is realized, new opportunities could develop in the mineral industry. The electric power grid will be extended into the more remote agricultural communities. Some marginal mineral deposits could be developed in these areas where power was not previously available. The Government announced that total electric power output in 1977 rose 10%. Electric power output for domestic use in 1978 was expected to increase 16% over that of 1977, and total electric power output in 1978 was planned to reach 340 million kilowatt-hours.

COMMODITY REVIEW

The major foreign exchange earner for Laos has been the country's tin mining operations, with concentrates being shipped to Thailand and Malaysia for smelting. During the second half of 1977, the Laotian Government nationalized without compensation the French-owned Phon Tiou tin mine, operated and partly owned by Société D'Etudes et d'Exploitations Miniéres de l'Indochine. Because of the complicated technology involved in concentrating the 0.2% Sn ore, the Laotians will need technical assistance in the operation of this mine. It is believed that Soviet experts will be used in management, but the maintenance and supplying of spare and replacement parts will be a major problem since the machinery is of United States, British, and French manufacture. It is doubtful, therefore, whether production can be continued at the current level of 900 to 1,000 tons per year of concentrate. Despite the maintenance situation, the Government's 1978 plan called for an increase in production of "refined tin" of about 900 tons.[19] It was not clear what this referred to since there was no known tin smelter in Laos.

The total output of salt from the Ban Keun area (18°22' N, 102°35' E) of the Vientiane Province rose from 3,000 tons the previous year to 7,000 tons during 1977. This amount meets the needs of both the Province and Vientiane City as well as providing a large quantity of salt for transporting to other provinces. The plan for the next year was to increase salt production to 15,000 tons, with most of the increase coming from the Vientiane Province. Additional small saltworks will contribute the balance of the quota.

Digitized by Google

The rich potash deposits along the Mekong River remained undeveloped owing to the lack of economic and technical resources needed to begin exploitation. The U.S.-surveyed sylvite deposit was 3.5 meters thick and encountered at depths of between 94 and 432 meters. The deposit could provide a valuable source of fertilizer, both for domestic use and for export to neighboring potash-deficient countries.

Rich iron ore deposits reportedly occur in Xiangkhoang Province (18°30' N, 103°30' E), but there was no decision on developing them because of the large amounts of capital that would be needed.

Laos continued to import modest amounts of petroleum products from Thailand since there was no crude oil or natural gas produced in the country during 1977.

Coal was mined near Muang Vangviang (probably 18°56' N, 102°27' E). Quality of the coal was good but production was apparently only a few thousand tons per year. There are also known occurrences of coal in the Saravane Province.

MONGOLIA[20]

The economy of the Mongolian People's Republic traditionally has been based on agriculture. Animal and agricultural products accounted for about one-half of Mongolia's output and almost 90% of the country's exports. In 1976, Mongolia initiated its sixth 5-year plan by which the country would be transformed to an industrial-agrarian-based economy. The plan called for closer integration of Mongolian and Soviet economies under the direction of the Mongolian-Soviet Intergovernmental Commission for Economic, Scientific, and Technological Cooperation.

The plan stressed higher labor efficiency and better product quality, and set a target of a 62.9% increase in gross industrial production over the 5-year period. As a basis for industrialization, much emphasis was to be placed on (1) developing the mining industry, particularly by coal, copper, fluorspar, and molybdenum, and (2) geological surveying for potential mineral deposits for commercial exploitation.

Mongolia continued to be dependent on foreign assistance. Government revenue in 1977 was estimated at 3,312 million tugriks compared to Government expenditure of 3,300 million tugriks. Mongolia exports mainly raw materials and foods (estimated value of imports in 1975 was $213 million) but imports value-added goods, such as machinery and plant equipment, manufactured consumer products, and petroleum. Exports in 1975 were valued at an estimated $260 million. The principal source of outside financial assistance was the U.S.S.R. and the Council for Mutual Economic Assistance (CMEA).[21]

Capital investment in 1978 for industrial expansion was projected to be $507 million, largely for the copper and molybdenum development at Erdenet. The 220-kilowatt powerline from Gusinoozersk in the U.S.S.R. to the industrial combine was completed in 1976, and the power station's first generator began operating. Construction of a water pipeline from the Selanga River was completed, measuring 80 centimeters in diameter and running 64 kilometers. In 1977, passenger train service was opened, linking Erdenet with Darhan and Ulan Bator. A radio relay line was put into operation between Erdenet and Dashinchilen, construction of a 265-meter bridge was completed across the Selanga River.

About 300,000 tons of fluorspar is produced annually from the Berhin fluorite mine. Reconstruction of the mine was well underway and, reportedly, construction of another similar enterprise was to begin in 1978 in the area of Berhin. Construction of the fluorite mine at Boro Ondor in southeastern Mongolia, described as the country's largest fluorite mine, began in 1977 with Soviet assistance. By the end of the current economic plan, export of fluorspar was expected to be 2.1 times the current level.

Coal mining is Mongolia's foremost mineral industry. During 1977, production of lignite and brown coal was estimated at 3.1 million tons and anthracite and bituminous coal, at 240,000 tons. About 75% of the country's coal output came from open pit mines, with the bulk of the production from Nalayha, Sharyn Gol, and Chuluum. Construction was to begin in 1978 on a large open pit coal mine at Baga Nuur, located about 110 kilometers southeast of Ulaanbaatar. This mine scheduled to open in 1980, was to be one of the largest coal mining enterprises in the state, producing 2 million tons per year of coal. A new city was to be built along the bank of the Hulen River, containing housing for 20,000 people.

NEPAL[22]

Nepal is not a major producer of any mineral commodity and the mining sector accounts for under 0.2% of the GDP. Agriculture accounts for about two-thirds of the GDP and directly employs 85% of the work force. Farming throughout most of the country is strictly on a local subsistence level.

The country did not have a good economic year in either FY 1976-77 or in FY 1977-78.[23] The GDP at constant 1975 prices was estimated at $1.49 billion[24] for both years and was up only marginally from the $1.44 billion recorded in FY 1975-76. The modest gain in GDP was more than offset by the 2.5% annual population growth. In addition, the price stability which prevailed the previous 2 years disappeared with an inflation rate of over 11% in FY 1977-78.

Nepal's trade imbalance, which had also remained relatively constant over the past 2 years, increased sharply from $70 million to $121 million in FY 1977-78. Exports decreased from $97 million in FY 1976-77 to $85 million in FY 1977-78. In the same period, the value of imports rose from $167 million to $206 million. Over 47% of the exports went to India and 63% of the imports came from India.

The Government, with considerable assistance from a variety of aid donors, continued to devote the major portion of its resources to developmental activities. The most important achievements to date have been in the area of infrastructure—roads, power, communications, and airfields. Over 50 kilometers of paved roads and 250 kilometers of motorable roads were added to the country's existing network during 1977. Opening of hitherto inaccessible areas to motor vehicles will help facilitate mineral exploration efforts. Three new small airfields also were completed and the national airline added a second jet to its fleet. Toward the end of the year, the Government's emphasis in spending was redirected from infrastructure development to the areas of health care, education, and agriculture.

Electric power demand has been increasing in the Kathmandu Valley and shortages were developing. In order to alleviate the situation, the Asia Development Bank financed the 32-megawatt Kulekhani hydroelectric project, under construction 30 kilometers southwest of the capital. This will be the largest powerplant in the country when completed in 3 or 4 years. Other power projects are planned or underway for later completion.

COMMODITY REVIEW

Cement was the most important mineral-based industry in the country; its value accounted for about 95% of the total of minerals produced in 1977. Production from the only plant was over 42,000 tons in FY 1976-77 and 28,000 tons in the first 9 months of FY 1977-78. The 50,000-ton-per-year designed capacity of the Himal plant, completed in 1975, did not meet the demand, which was estimated at 160,000 to 170,000 tons per year. The difference was made up by imports from India and several other countries. In order to relieve the shortages, the Government-owned Hetauda Cement Industries, Ltd., began construction of a 260,000-ton-per-year plant at Hetauda. The town is strategically located at the juncture of the Katmandu Valley, the Birgunj-Hetauda industrial corridor, and the head of the Chitawan Valley. The plant will employ about 1,400 persons and is being financed by a loan from the Asian Development Bank. Scheduled completion is for November 1981.

There have been discussions with Indian officials on the feasibility of jointly establishing a large, export-oriented cement plant in the Udaipur district southeast of Katmandu, where over 25 million tons of high-grade limestone have been confirmed.

The first lime plant in Nepal was inaugurated in December 1977 at Chobhar in the Katmandu area. The plant capacity was rated at 6,000 tons per year of agricultural lime. Nepal reportedly consumes a great deal more than this, presumably all imported from India.

Demand for limestone has increased with the growing number of industries in the country. Nepal became self-sufficient in FY 1975-76 and produced about 54,000 tons of limestone in FY 1976-77. Most of the stone was quarried at Jogimara, and Birgunj. Plans were underway to increase production by at least 4,000 tons in 1978.

The Nepal Mining Co. in 1976 began development of the Ganesh Himal zinc mine at Lari, 56 kilometers northwest of Katmandu. There were no recent data available on the project but it was assumed that shaft sinking was continuing. This would be the first metallic mineral exploitation in Nepal by a modern operation.

Mainland China was reportedly aiding in the construction of a 20-million-unit-per-

Digitized by Google

year brick and tile works at Nangkhel in Bhaktapur. The plant was scheduled for opening in late 1979.

A small but encouraging copper deposit was discovered in 1977 by the Mining and Geology Department in the Baglung district (approximately 28°16' N, 83°36' E), 180 kilometers west of Katmandu. Apparently, about 150,000 tons of ore were assayed showing 1.7% copper and 1.5 grams per ton of gold. Unless additional tonnage is discovered, this one deposit would not appear to be economically exploitable.

In addition, Nepal has been studying deposits of iron ore, magnesite, and coal, which may be large enough to develop. The Mines and Geology Department, in conjunction with an Indian company, were studying the feasibility of establishing a small steel plant based on an iron ore deposit at Phulchoki near Katmandu. Presently, a small foundry and rolling mill turn out about 5,000 tons per year of reinforcing bars and structural shapes. More sophisticated varieties and forms of steel are imported.

Discussions were underway with India on the possibility of setting up a magnesite refractory brick plant at Lamosangu or Birgunj. The magnesite deposit is reportedly located at Kharidhunga in Sindu Palchok district (27°55' N, 85°45' E). The products would be exported to India.

The Nepalese press announced the discovery of a coal deposit in the Mekwanpur district only 11 kilometers from the Hetauda industrial area. Further studies were underway to evaluate the deposit, which was discovered during the construction of the Hetauda-Narayanghat road. If developed, this would be the first bituminous coal mine in the country. Less than 2,000 tons of lignite were mined in Nepal in 1977.

Nepal was totally dependent on imports to supply its petroleum needs. The U.S.S.R. was a major supplier of petroleum through a swap arrangement with India. India took control of the incoming oil at various ports of entry and supplied an equal amount to Nepal from the refinery most convenient to the Nepal border. In FY 1976-77, Nepal received a total of about 75,000 tons of petroleum, mostly from the U.S.S.R. In FY 1977-78, the Soviet deliveries were reportedly about 51,000 tons, while other countries supplied about 77,000 tons. The total for FY 1978-79 was projected at about 140,000 tons.[25] It was evident that as Nepal's development efforts accelerate, its consumption of petroleum products will increase rapidly, putting a further burden on its already unfavorable balance of trade.

SINGAPORE[26]

Singapore with nearly 2.4 million people achieved a 9.7% economic growth rate, with the GNP in 1977 reaching an estimated $6.5 billion (or 15.5 billion Singapore dollars) in current prices.[27] Real growth rate was closer to 7.8%, which was the general level that government planners expected for 1977. Once one of Asia's star performers, the Singapore economy was entering a phase of consolidation and slower growth compared with that of the late 1960's and early 1970's, although it was still much above the average for most developing countries. The slowdown began with the international oil crisis. The prolonged slump in several leading industries, such as petroleum refining, oil rig construction, shipping, and shipbuilding, which was partly caused by the sluggish economies of Japan, Western Europe, and the United States, appeared to be ending in early 1977.

Entrepôt trade was still the dominant part of Singapore's economy in 1977, with services (including the hotel and restaurant trade) accounting for about 70% of its GNP and total foreign trade amounting to nearly three times the GNP. However, petroleum-related activities, advanced technology in manufacturing industries, and financial and communications activities have steadily gained ground. Manufacturing rose 8% in 1977, accounting for about one-fifth of the GNP. Two-thirds of the manufacturing output was exported. Combined foreign and domestic plant and equipment investment for Singapore was about $1 billion in both 1976 and 1977.

The petroleum industry was by far Singapore's most important "manufacturing" component, accounting for over 40% of its total manufacturing output in 1977 and about 15% of the value added in manufacturing. Oil refineries were upgrading their processing facilities, and the projected Sumitomo petrochemical complex, if actually started, would certainly provide some stimulus to the industry. Since Singapore is Southeast Asia's oil exploration support center, business was somewhat slow because of the relative inactivity in this area during the year.

The electrical and electronics industries increased output by 17%, despite growing

Digitized by Google

restrictions in Singapore's traditional markets. Singapore maintained its competitive edge by making better and more various products. Three-quarters of all new manufacturing jobs were in the electronics industry. The clothing industry and the machinery-appliances sector remained sluggish in 1977.

Shipbuilding activities continued to decline because of the world surplus tonnage in ships. However, shipyards turned to building cranes, barges, dredges, and heavy offshore structures, as well as a few jackup rigs. Ship-repairing activity increased 10%. Singapore has been the world's No. 4 port for some years.

Alongside the progress in industry, trade, and tourism, Singapore made headway toward becoming a major international financial center through development of its Asian dollar market, gold market, and secondary money market. A gold exchange was created, involving both spot and future contracts based upon certificates of gold deposits issued by authorized banks, on similar lines as the Winnepeg exchange. With regard to trade, Singapore's foreign reserve position improved from $3.37 billion at yearend 1976 to $3.72 billion at yearend 1977.

PRODUCTION

In 1977, Singapore produced about S$7.02 billion (convert at the rate of S$2.42 to US$1) worth of petroleum products by processing S$6.25 billion worth of crude oil with roughly 3,100 workers, thereby earning S$774 million in value added.[28] In 1976, corresponding output was S$6.17 billion (convert at S$2.45 to US$1), input was S$5.50 billion, and value added was S$672 million. Residual fuel oil ranked first in production tonnage, followed by distillate fuel oil, gasoline, jet fuel, kerosine, and lubricants, in that order. The refining industry had not recovered from the loss of the Vietnamese market and reluctance of Japan to buy its refined oil. However, refining capacity utilization increased to over 60% in 1977. Singapore had been producing over 2.5 million cubic yards of granite annually in recent years. The country's mineral production statistics are shown in table 1 which covers all lesser countries in the Far East.

Singapore's mineral economy shows a pattern of processing foreign raw materials (and/or intermediate materials) and domestic scrap into finished products. More than 1 million tons of cement was produced for the sixth year in a row to sustain continued high levels of construction, but the principal raw material was actually imported clinker. The roughly 200,000 tons of ingot steel produced in 1977 was from scrap; Singapore also imported much larger tonnages of steel products and semimanufactures, some of which was converted to additional downstream products. The country's statistics show that value added for cement in 1977 was S$47 million; concrete products, S$25 million; iron and steel, S$66 million; nonferrous metals, S$13 million; and nonmetallic minerals, about S$38 million.

TRADE

Singapore's total foreign trade increased to S$45.6 billion (US$18.9 billion) in 1977, compared with S$38.7 billion (US$15.8 billion) in 1976. Exports (f.o.b.) rose 22% to S$20.1 billion and imports (c.i.f.) rose 19% to S$25.5 billion in 1977. The trade deficit was more than offset by income from services such as tourism, banking, insurance, shipping, and by capital inflow from abroad. In fact, a net balance-of-payments surplus of $404 million was registered in 1977. The preceeding figures do not include trade with Indonesia.

Singapore's most important trading partner in 1977 was the United States, with imports at S$3.23 billion and exports at S$3.12 billion, 12% and 15%, respectively, of the totals. Imports from Japan were higher at S$4.47 billion and exports to Japan lower at S$1.92 billion. Next came Peninsula Malaysia with imports of S$3.05 billion and exports of S$2.19 billion. Other important trading areas included Hong Kong, the United Kingdom, Australia, West Germany, Sabah-Sarawak, Thailand, the People's Republic of China, France, the Netherlands, and Italy.

In terms of commodity groups, Singapore's most important exports in 1977 were machinery and equipment, 24.5%; mineral fuels, 24.24%; crude inedible materials, 15.7; manufactured materials, 8.0%; food and live animals, 7.0%; and chemicals, 3.6%. The most important imports in 1977 were machinery and equipment, 26.4%; mineral fuels, 25.6%; manufactured materials, 14.2%; crude inedible materials, 8.9%; food and live animals, 8.7%; and chemicals, 5.2%.

The entrepôt nature of Singapore's economy is self evident in these trade figures and petroleum occupies a special position. In 1977, Singapore imported 23.6 million tons of crude oil and 4.0 million tons of refined oil, and exported 14.5 million tons of refined oil. Most of Singapore's crude oil imports

Digitized by Google

came from Kuwait, Saudi Arabia, and Iran. Its sales of refined oil went primarily to other Asian countries or for bunkering, in addition to the domestic market. Singapore's 1977 oil import bill was about $2.69 billion, but its refined oil exports were worth $2.03 billion and monies earned from bunkering were sizable also.

Table 4.—Singapore: Exports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
METALS			
Aluminum:			
Bauxite and concentrate	450	--	
Oxide and hydroxide	4,319	22,856	Malaysia 21,853.
Metal including alloys:			
Scrap	2,512	3,792	Japan 2,240; Pakistan 1,512.
Unwrought and semimanufactures	732	1,654	Malaysia 920; Thailand 335; Hong Kong 225.
Chromium oxide and hydroxide	16	13	Mainly to Malaysia.
Cobalt oxide and hydroxide	1	1	Mainly to Hong Kong.
Copper:			
Sulfate	183	165	Mainly to Malaysia.
Metal including alloys:			
Scrap	4,471	7,193	India 1,916; Republic of Korea 1,615; Malaysia 1,565; Pakistan 763.
Unwrought and semimanufactures	r1,802	1,637	Malaysia 1,561.
Iron and steel:			
Metal:			
Scrap	1,539	3,102	Taiwan 1,502; Japan 697; Netherlands 401.
Pig iron, ferroalloys, similar materials	7,702	5,213	Malaysia 5,182.
Steel, primary forms	8,448	5,765	Malaysia 5,326.
Semimanufactures:			
Bars, rods, angles, shapes, sections	55,848	55,412	Malaysia 35,865; Brunei 7,958.
Universals, plates, sheets	41,631	66,113	Malaysia 59,527.
Hoop and strip	1,161	2,216	Malaysia 2,178.
Rails and accessories	2,081	4,857	Malaysia 4,840.
Wire	2,785	3,393	Malaysia 2,134; Brunei 715.
Tubes, pipes, fittings	74,484	53,910	Brunei 13,353; United Arab Emirates 8,192; Malaysia 7,162.
Casting	762	175	Malaysia 95; Brunei 32.
Total	178,752	186,076	
Lead:			
Ore and concentrate	21	15	All to Malaysia.
Oxides	51	46	Malaysia 40; Hong Kong 6.

Scrap, nonferrous	(2)	--	
Metalloids	35	32	Mainly to Malaysia.
Alkali, alkaline earth, rare-earth metals	15	2	Do.
Base metals including alloys, all forms, n.e.s	1,251	211	Japan 98; Malaysia 75.
NONMETALS			
Abrasives, natural, n.e.s.:			
Pumice, emery, natural corundum, etc	63	53	Malaysia 31; Pakistan 21.
Grinding and polishing wheels and stones	155	197	Malaysia 102; Hong Kong 61.
Asbestos	1,670	1,098	Malaysia 787.
Clays and clay products (including all refractory brick):			
Crude clays:			
Kaolin	144	611	Japan 360; Malaysia 251.
Other	11,837	10,629	Philippines 2,194; United Arab Emirates 2,014; Malaysia 1,902; Bangladesh 1,121.
Products:			
Refractory (including nonclay brick)	1,372	620	Malaysia 582.
Nonrefractory[3]	4,529	4,426	Malaysia 2,554; Brunei 1,330.
Diamond:			
Gem, not set or strung value, thousands	$8,186	$2,228	Hong Kong $1,573; Japan $298.
Industrial do	--	$73	All to Hong Kong.
Feldspar and fluorspar	1,529	5,105	All to Malaysia.
Fertilizer materials:			
Crude:			
Nitrogenous	2	8	Do.
Phosphatic	33,467	30,986	Malaysia 28,443.
Manufactured:			
Nitrogenous	21,845	27,830	Malaysia 27,788.
Phosphatic	6,324	2,230	Malaysia 2,173.
Potassic	134,740	153,045	Malaysia 146,579.
Other, including mixed	17,623	23,797	Malaysia 23,586.
Ammonia	336	383	Malaysia 368.
Graphite, natural	130	20	India 10; Malaysia 10.
Gypsum and plasters	357	610	Malaysia 519.
Lime	2,375	2,776	Malaysia 1,427; Brunei 982; Bangladesh 314.
Magnesite	58	182	All to Malaysia.
Mica, all forms	314	153	Bangladesh 41; Sri Lanka 37; Thailand 35.
Pigments, mineral:			
Natural, crude	69	24	Mainly to Malaysia.
Iron oxides, processed	102	108	Do.
Precious and semiprecious stones, including synthetic, except diamond value, thousands	$1,124	$3,124	Hong Kong $2,522; Japan $353.
Salt	12,408	11,996	Malaysia 5,950; Brunei 4,536.
Sodium and potassium compounds, n.e.s	7,938	4,771	Malaysia 4,405.

Table 4.—Singapore: Exports of mineral commodities —Continued

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976
NONMETALS —Continued			
Stone, sand and gravel:			
Dimension stone	1,961	732	Malaysia 493; Bangladesh 130; Brunei 94.
Dolomite, chiefly refractory grade	--	3	All to Malaysia.
Gravel and crushed rock	18,241	7,281	Brunei 6,444; Malaysia 770.
Limestone	212	294	Malaysia 264; Brunei 29.
Quartz and quartzite	2	--	
Sand, excluding metal bearing	1,179	1,346	Brunei 692; Malaysia 507.
Sulfur:			
Elemental:			
Other than colloidal	15,541	14,110	Mainly to Malaysia.
Colloidal	5,394	8,158	Malaysia 6,035; Thailand 900.
Sulfur dioxide	1	2	All to Malaysia.
Sulfuric acid	1,505	3,750	Malaysia 2,517; United Arab Emirates 910.
Talc, steatite, soapstone, pyrophyllite	807	1,156	Malaysia 1,123.
Other nonmetals, n.e.s.:			
Crude	16,959	--	
Slag, dross, similar waste, not metal bearing	857	480	Philippines 296; Malaysia 89; Bangladesh 73.
Oxides and hydroxides of magnesium, strontium, barium	9	11	All to Malaysia.
Bromine, iodine, fluorine value	$1,386	$1,589	Malaysia $1,408.
MINERAL FUELS AND RELATED MATERIALS			
Asphalt and bitumen, natural	577	1,635	Mainly to Malaysia.
Carbon, black	1,285	738	Malaysia 542.
Coal, all grades, including briquets	301	148	Bangladesh 51; Philippines 27; Thailand 21; India 18.
Coke	3,518	4,974	Malaysia 4,669.
Hydrogen, helium, rare gases value, thousands	$198	$164	Malaysia $37; Hong Kong $35; Thailand $26; India $24; Philippines $23.
Petroleum:			
Crude and partly refined thousand 42-gallon barrels	1,886	8	All to United States.
Refinery products:[4]			
Gasoline:			
Aviation do	670	529	Australia 197; New Zealand 96; New Guinea 71; Thailand 52.
Motor do	6,276	5,846	Australia 1,144; Hong Kong 805.
Kerosine and jet fuel do	14,343	14,001	United States 4,349; Hong Kong 3,719.
Distillate fuel oil do	20,151	19,184	Hong Kong 4,095; Malaysia 4,081; Australia 3,381; Thailand 3,260.
Residual fuel oil do	34,191	42,385	Hong Kong 14,655; Japan 14,389; Australia 6,698.
Lubricants do	2,181	2,587	Malaysia 772; Thailand 683.
Mineral jelly and wax do	280	246	Brazil 20; Malaysia 16; Philippines 15.
Other:			
Naphtha do	10,634	9,631	Malaysia 7,001; Philippines 1,260.
Nonlubricating oils, n.e.s. do	29	36	Malaysia 15; Saudi Arabia 7; United Arab Emirates 3.
Pitch and petroleum coke do	2	8	Mainly to Malaysia.
Bitumen and bituminous mixtures, n.e.s do	1,037	1,100	Australia 208; United Arab Emirates 200; Hong Kong 195; Malaysia 115.
Unspecified do	7,730	7,945	Japan 7,377.
Total do	97,524	103,498	
Mineral tar and other coal-, petroleum-, or gas-derived crude chemicals	759	710	Malaysia 501; Nigeria 170.

[r] Revised.
[1] Less than 1/2 unit.
[2] Listed under individual metals.
[3] Total excludes bricks of baked clay valued at $37,884 in 1975 and $34,274 in 1976.
[4] In addition to the products listed, liquefied petroleum gas valued at $17,733,428 in 1975 and $15,490,337 in 1976 was exported.

[1]Less than 1/2 unit.
[2]Total excludes quantity valued at US$287,126 for 1975 and US$812,892 for 1976.
[3]Listed under individual metals.
[4]Total excludes brick of baked clay valued at US$757,268 in 1975 and US$1,073,845 in 1976.
[5]Total excludes quantity valued at US$38 in 1976.
[6]In addition to products listed, liquefied petroleum gas valued at US$235,957 in 1975 and US$19,567 in 1976 was imported.
[7]Total excludes quantity valued at US$4,106 in 1976.

COMMODITY REVIEW

Metals.—*Iron and Steel.*—Singapore's steel imports were about 1 million tons in 1977 and in 1976 and 1.4 million tons in 1974, with Japan by far the leading supplier. Steel imports in 1977 were worth about $200 million. About two-thirds of the steel imports from Japan consisted of shapes, plates, pipe, and tubing. The steel ingots locally produced, which amount to about 200,000 tons annually, are derived from scrap. The ingots along with imported materials are then made mainly into rolled semimanufactures.

Reportedly, there were 14 small iron and steel establishments in 1977, employing about 1,450 workers. Only two steel producers were of any consequence—National Iron and Steel Mills, Ltd. (NISM), and Malayan Iron and Steel Mills, Ltd. NISM's plant at Jurong has electric furnaces, merchant bar mills, and a wire rod mill which together turn out more than 200,000 tons of steel products annually. Malayan Mills' facilities are considerably smaller than those of NISM. NISM and Japan's Mitsui & Co., Ltd., have a joint venture called Eastern Wire Manufacturing Co.

Tin.—Although this 200-square-mile island nation has no tin production, it plays a key role as a leading clearinghouse for Southeast Asia's tin smuggling syndicates.[29] Singapore's imports of tin-in-concentrates rose from 37 tons in 1975 to 982 tons in 1976 to 2,290 tons in 1977. The country's largest tin buyer, Kin Hok, has begun to operate its own tin smelter, rated at 150 tons per month, to smelt part of the smuggled in concentrates. In 1976 when the smelter was not yet built, official imports of concentrates (about 72% grade) were 982 tons compared with exports of 5,498 tons; corresponding figures for the first 6 months of 1977 were 943 tons and 4,030 tons. Tin, of course, was worth over $10,000 per ton. Custom officials have been unable to stop the steady stream of concentrates brought in by small boats, trucks, and private cars from Malaysia, Indonesia, Thailand, and Burma. About 10 small firms handle the influx. Customs records show that exported concentrates go mainly to the smelters in Spain, the Soviet Union, Brazil, and secondarily to Mexico, Portugal, Republic of Korea, and Taiwan.

Nonmetals.—*Cement.*—Singapore had seven cement and cement additive establishments in 1977, employing about 570

Digitized by Google

workers and realizing S$47 million (US$19.5 million) worth of value added from an output of S$169 million and an input of S$123 million. Virtually all are grinding operations, relying on imports of clinker. In 1976, Singapore's imports of such clinker were 1.58 million tons, 72% from Japan and 22% from the Republic of Korea and Taiwan combined. Output of finished cement corresponded closely to the amounts of clinker imported. Singapore's imports of finished cement have always been considerably less than 100,000 tons annually. Construction has averaged about S$500 million yearly during 1972-77, which represented about 6% of the GNP. One of the large construction jobs in recent years was the Changi airport.

Ssangyong Cement Industrial Co. Ltd. of the Republic of Korea purchased a $32 million, 600,000-ton-per-year clinker grinding system from the Fuller Co. for its joint venture plant in Singapore.[30] This pollution-free plant with a 4,000-horsepower finish grinding mill and in-plant dust collectors started operations and was fully operative by mid-1977. Ssangyong's partners included the Development Bank of Singapore and the Afro-Asian Shipping Co. Pte., Ltd., both headquartered in Singapore. Three older cement plants can be identified—Asia Cement (Singapore) Pte., Ltd.'s 420,000-ton-per-year plant at Jurong; Singapore Cement Manufacturing Co. (Pte.), Ltd.'s 320,000-ton-per-year plant; and Pan Malaysia Cement Works Ltd.'s 260,000-ton-per-year plant at Jurong.

Mineral Fuels.—*Petroleum.*—Only Rotterdam, Netherlands and Houston, Tex., have larger petroleum refining complexes than Singapore. Singapore expanded its oil refining capacity to about 1 million barrels per day around the beginning of 1977. Shell Eastern Petroleum, Ltd. (Shell), had expanded its refinery on Pulau Bukom Island to 550,000 barrels per day, making this operation the world's second largest single refinery after another of Shell's refineries at Rotterdam. Esso Singapore Pte. Ltd. (Esso) has a 230,000-barrel-per-day refinery at Pulau Ayer Chawan; Mobil Oil Singapore Pte., Ltd., a 180,000-barrel-per-day refinery at the Jurong Industrial Estate; and Singapore Petroleum Co. Pte. Ltd. and B. P. Refinery Singapore Pte., Ltd., smaller refineries. The sharp increase in oil prices and the subsequent worldwide recession had cut down severely on the demand for Singapore's fuel oil. In early 1977, Singapore's refineries started to redesign facilities in order to handle lighter crude oil and to produce more distillates like automotive diesel oil and kerosine. Also, Singapore refineries had been designed for the high-sulfur crudes of the Middle East and some redesigning was contemplated in this area too.

Singapore's refiners moved toward building more capacity to produce lighter petroleum products. The Singapore Petroleum Co. installed a 15,000-barrel-per-day hydrocracking unit. Mobil Oil, as part of a major effort to upgrade its oil refining capacity announced a reformer expansion project to convert a 10,000-barrel-per-day naphtha facility to making gasoline. Royal Dutch Shell indicated that it intended to build a $144 million hydrocracking unit at its big refinery. Another dimension to Singapore's upstream oil activities is the expected construction of a large petrochemical complex on Pulau Ayer Merbau by a joint venture headed by Sumitomo Chemical Corp. of Japan.

Many international oil companies working in Southeast Asia have established headquarters in this small country. In fact, Singapore has been an oil logistics center in the Pacific for some time, with various kinds of seafaring oil exploration and development barges and equipment being built, assembled, and serviced here. Thus, slackening of oil exploration in Indonesia during 1976-77 affected Singapore's economy adversely.

SRI LANKA[31]

After 2 years of serious drought, Sri Lanka saw a return to normal rainfall in the latter part of 1976 and throughout 1977. The economy was strongly agrarian and major crops responded to the favorable conditions with significantly increased yields. The combination of good rainfall, more acreage under cultivation, and increased use of fertilizers produced a record paddy harvest of 80.4 million bushels (about 1.15 million tons of milled rice) in 1977. This surpassed the one-time harvest peak of 77 million bushels in 1970. The favorable agricultural output led the economy to a 4.4% gain in GNP at constant 1959 prices. GNP at current prices was $3.18 billion in 1977.

Digitized by Google

Estimated breakdown by sector was as follows: 52.8% services; 32.0% agriculture; 12.6% manufacturing; and 2.6% mining.

From a record high deficit of $202 million[32] in 1975, Sri Lanka's trade balance improved dramatically in the following years. A sharp rise in export earnings finally produced a trade surplus of $54 million in 1977, the first such surplus since 1956. Total exports increased about 30% over those of 1976 to $726 million, while imports increased by only about 5% to $672 million.[33] The increase in imports were due to a larger volume of food purchases. The plantation crops of tea, rubber, and coconuts accounted for about three-fourths of the value of Sri Lanka's exports and provided employment for over 1 million workers.

The social welfare programs of the last 7 years, have led to a higher literacy rate, better health conditions, and a better standard of living for the average citizen. However, private foreign investment money was scarce because of fear of nationalization. Strikes and other problems in the transportation network led to periodic shortages of food and other essential commodities. The result of these external and internal difficulties was that real economic growth was slow and unemployment grew to 20% of the labor force.

The United National Party (UNP) won the July 1977 general elections. The new UNP Government, headed by Junius R. Jayewardene, began a program to reform the economy and accelerate economic growth. How much the changes in economic policy will affect the mineral industry remains to be seen.

COMMODITY REVIEW

Sri Lanka has been famous for its precious and semiprecious gems since ancient times and is still one of the major world producers of sapphire, ruby, cat's eye, and alexandrite. Gem production accounted for over 80% of the value of mine output.[34] Gems have become the principal nonagricultural export for Sri Lanka as a result of various incentives offered by the Government in 1972. Exports of gems reached an alltime high in 1976 but declined by 12% to about $29 million in 1977. The decline was believed to be owing largely to the uncertainties of the new Government's economic policies and the termination in late 1977 of the convertible rupee account (CRA), which had permitted gem traders to convert 20% of export earnings into free foreign exchange for import purposes.[35] The CRA had been a very effective incentive, considering the otherwise extremely tight controls on the importation of most consumer or luxury items.

Despite the economic incentive to deal through legitimate channels, it was estimated that smuggling accounted for 30% of the gem trade and that this proportion would probably increase with the withdrawal of the incentives. In addition to direct exports, domestic sales of gems and jewelry to foreign tourists during 1977 was $8 million.

During the year, gems were exported to 25 countries. Among these, Japan accounted for roughly 40%, followed by Hong Kong with 28%, Switzerland with 8%, and the United States with 7%. Sapphire accounted for about 64% of the total value.[36]

The public sector State Gem Corporation (SGC), which was established in 1971, handled the purchase and export of gems and issued licenses for private miners and dealers. SGC also cuts, polishes, and sells gems and jewelry. It introduced new testing and electric cutting and polishing machines in its own plant, but most of the country's gems were cut and polished in the villages by hand-built and hand-operated machines.

About 80% of the gem fields were located in Sabaragamuwa Province in the southwest part of the island. Ratnapura district, where traditional pit and tunnel manual mining by family or small groups continued, was the richest area. About 7,000 pits were believed to be in operation. The only mechanization was the use of some pumps in the deeper pits to remove water. The deposits are alluvial in nature and efforts to categorize the reserves or locate the primary sources have been unsuccessful.

By far the second most valuable mineral-derived product was cement. Production was over 355,000 tons in 1977, valued at about one-half the gem output total. Total capacity of the Puttalam and Kankesanturai plants was listed as 710,000 tons per year, but they have not run at nearly their designed rate for several years. A small clinker grinding plant at Galle operated on material supplied by the other two plants.

There were plans to increase production capacity because of anticipated higher demand. One plan would add a 1,200-ton-per-day kiln at the Kankesanturai plant. The other would start from scratch with a new plant in the Mannar district. The supply of

Digitized by Google

raw materials is close to the Mannar site, but power and water supplies are scarce in that area. In view of the present excess capacity, the expansion will probably not occur for several years.

Natural graphite production in Sri Lanka ranked sixth in the world in 1977 and was the country's second ranking mineral export in terms of value. Production from the two major active mines—Bogala and Kahatagaha-Kolongalla—totaled 8,875 tons in 1977, a 7% increase over 1976 production. Total exports were 8,769 tons valued at about $2.5 million. Japan was the major importer, followed by the United States and the United Kingdom.

Two new prospects were under development, one at Rangala (7°21' N, 80°47' E) and the other at Ragedara. Commercial production was scheduled to begin at Rangala during 1979. Several additional years will be needed to bring the Ragedara prospect into production. It was planned that the new operations would each produce 1,200 tons per year of graphite. In addition, detailed geological investigation was underway at Siyamballapitiya in the Kegalla district. Exploration was planned to begin in 1978 on a reported flake graphite deposit at Meegahatenne in the Kalutara district.

To further increase the recovery and export potential, the State Graphite Corporation (SGC) was seeking funds to expand the corporation's milling and flotation capacity from 300 to 1,000 tons per year. Foreign collaboration was being sought to set up an export-oriented graphite lubricant plant, and SGC was planning to add a heavy media flotation processing plant as well. The plant could use presently noncommercial low-grade ore and beneficiate it into the highest commercial grades.

Production of other minerals was mixed in 1977. Ball clay, kaolin, clay for brick, and feldspar all increased while salt, clay for cement, limestone, quartz, and titanium minerals all decreased. None of these minerals were of great significance outside the local economy. Their aggregate value was only about 8% of the total value of mineral output.

The output of ilmenite, rutile, and zircon dropped again in 1977 because of decreased demand by the Japanese, principal purchaser of Sri Lanka's ilmenite, and by the delay caused by reconstruction of the processing plant at the Pulmoddai mineral sands deposit. The entire rutile/zircon plant was moved from near Trincomalee to the site of the Pulmoddai deposit. The facilities were not only integrated with the magnetic ilmenite concentration plant but expanded and modernized as well at a cost of about $12 million. The complex now has an annual capacity of 86,000-96,000 tons of ilmenite, 12,000-14,000 tons of rutile and 6,000-8,000 tons of zircon from the processing of 130,000 tons of raw sand plus reclaimed tailings. The nonmagnetic tailings from the ilmenite plant are combined with reclaimed tailings from past operations and fed to the rutile/zircon plant for concentration. Some 300 tons per year of 70% monazite concentrate are also recovered and stockpiled.

An expansion of the ilmenite plant was scheduled for 1986 when the supply of accumulated tailings will be exhausted. Present sands being mined are running 70%-80% heavy minerals and are considered one of the richest in the world. Exports of ilmenite and rutile in 1977 were 41,000 tons and 200 tons, respectively.

It was reported that the iron/copper ore deposit at Seruvilia near Trincomalee was found to be good enough to warrant exploitation. The Government was seeking funding and foreign expertise on the development of the deposit. Plans were to try to utilize both the iron and the copper values in the ore. The Ceylon Steel Corp. would use part of the iron output in place of the presently imported iron billets.

Geological exploration proved 25 million tons of phosphate rock grading 33% P_2O_5 in the Eppawela area south of Anaradhapura. The Government was still planning for the large-scale exploitation of the deposits, and in 1978 will probably invite proposals for a two-stage development program. The first stage would be a mining, crushing, and grinding facility, and the second stage would be a super phosphate or magnesium calcium phosphate plant. A small crushing plant currently supplies about 20 tons per day for direct application on suitable perennial crops.

Construction continued on the ammonia/urea fertilizer complex at Sapugaskanda. The plant, designed mainly by Kellogg Overseas Corp., will be rated at 147,000 tons per year nitrogen content of ammonia and will use naphtha from the nearby petroleum refinery. Total cost of the plant, being financed by the Asian Development Bank, Kuwait, the Federal Republic of Germany, and India, will be approximately $150 million.

Sri Lanka produced no oil or gas during

Digitized by Google

1977 and was entirely dependent on petroleum imports for its requirements. Crude oil imports rose slightly to an estimated 1.53 million tons valued at $149 million. The cost of the imports, however, increased 15% over that of 1976 because of world price increases. Saudi Arabia supplied about 60% of the crude and Iran the remainder. Exports of surplus naphtha, bunker oil, diesel, and jet fuel brought a return of $65 million.[37]

Sri Lanka's only petroleum refinery, at Sapugaskanda, was being expanded during the year. The new construction will increase production of the light distillates.

Table 6.—Sri Lanka: Imports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976
METALS		
Aluminum metal including alloys, all forms	1,652	2,415
Arsenic trioxide, pentoxide, acid value	$4,847	$11
Copper metal including alloys, all forms	1,257	1,190
Iron and steel, metal:		
Scrap	--	--
Pig iron, ferroalloys, similar materials	156	437
Steel, primary forms	20,772	15,242
Semimanufactures	22,059	21,746

VIETNAM[38]

During the first full year of unification, rebuilding of the Socialist Republic of Vietnam's war-damaged industrial and agricultural base was essentially completed and efforts were turned to expanding the economy. The GNP in 1977 was estimated to be $7.3 billion at market prices. This was an average increase of nearly 30% over the $4.6 billion estimated for 1975. The U.S.S.R. and East European countries were the main external contributors to Vietnam's rebuilding program.

Government authorities were encountering difficulties in rehabilitating a war-damaged society and implementing new social programs. Unemployment persisted in the south, particularly in the densely populated Ho Chi Minh City area (formerly Saigon). A program of moving people from urban areas into newly opened rural land was proceeding as fast as practical. The Government's plan was to relocate 10 million people from high-density areas in the next 10-15 years. It was reported that about 500,000 to 700,000 persons had already left Ho Chi Minh City. A shortage of funds to develop virgin land, a serious increase in malaria, and a reluctance on the part of the people to move was hindering the implementation of the Government reforms. Despite the problems, however, almost 450,000 hectares of land left fallow during the war and 300,000 hectares of virgin land was put under cultivation during 1977. The crowded urban conditions were exacerbated by the reported 3% annual population growth rate. The official plan was to reduce this rate to 2.4% by 1980 and to 1.5% by 1990.

In June, the senior official in Ho Chi Minh City announced that all business and agriculture in what was once South Vietnam was to be fully collectivized by 1979. The state was to buy business facilities and inventories. Persons having technical and professional skills were to be employed in state-run trades.

The long-term objective of the Government was to establish heavy industry as the base for the economy. The immediate emphasis, however, was to alleviate acute food shortages and to greatly increase agricultural output. Of the total $7.5 billion outlay envisioned for the second 5-year plan (covering 1976-1980), $2.3 billion were earmarked directly for agricultural expansion, and a large proportion of the 35% allocated for industry was to go for the manufacture of products, equipment, or systems that would support or benefit the agricultural sector. Despite the plans and preparations, severe weather conditions, including a combination of abnormally cold temperatures in the north, drought in the Hanoi area and in the Mekong Delta, and local flooding from typhoon rains, seriously damaged the crops in 1977.

Vietnam was looking to increase trade with its Asian neighbors. During the year,

Digitized by Google

more than 60% of its trade was with centrally planned economy countries. In order to encourage trade development and economic growth, the Government drafted foreign investment rules that would allow up to 49% foreign participation in a wide range of industrial activity on a profit-sharing basis. Exports in 1977 showed a substantial increase over those in 1976. According to foreign trade minister, Dang Viet Chau, exports from the north and south of Vietnam in 1976 totaled about $240 million.[39] Additionally, overall exports in 1977 had increased 37% to $328 million. Both the total 1976 level of exports and the rate of growth given by the foreign trade ministry were slightly higher than had been estimated by most foreign observers. Export increases were predicted to grow at a 40% annual rate until 1980. Although high-grade coal was Vietnam's largest export item, agricultural, fishing, and forestry products were also to be important trade items in the current development plan.

The value of Vietnam's imports from market economy countries was reportedly about $427 million in 1977.[40] Moreover, the volume of trade with the U.S.S.R. and other planned economy countries normally account for a considerable amount. The overall trade deficit was estimated between $600 million and $700 million. Most of Vietnam's imports were raw materials and fuel, machinery and equipment, and foodstuffs and products. In view of the growing needs for industry and infrastructure, the country's trade deficit was expected to rise to about $1 billion by 1980.

Rapid expansion of the electric power network continued during the year, with priority given to projects that supply power to the agricultural sector. The mining sector would also benefit indirectly from expanding the powerline network; small or marginal deposits, which would normally not warrant extension of a powerline, would have access to electricity from new lines that supply outlying pumping stations. Most of the electricity generated in the north was produced in plants fueled by domestic coal supplies, while the southern area is more dependent on hydroelectric as well as hydrocarbon fueled plants. The total capacity of irrigation pumping stations powered by electricity reportedly increased from 219 megawatts in 1976 to 237 megawatts in 1977. Total output of electric power was given as 3.36 billion kilowatt-hours during 1977, a 16% increase over that of 1976. The Government's target for electric power in 1978 was 3.9 billion kilowatt-hours. Total generating capacity of the country was reported as 1,300 megawatts.

The third generator of the Da Nhim hydroelectric plant in the south was repaired, bringing the plant capacity to 160 megawatts. Government experts were studying plans to expand the capacity to 300 megawatts. Two new 70-megawatt generators in a pumped storage configuration would provide the increase.

Construction was nearly finished on the 110-kilovolt powerline, 52 kilometers long from An Lac to Thai Binh. When completed, the line will connect the Ninh Binh thermal powerplant to the Haiphong municipal grid.

Preparatory work on the giant Da River hydroelectric project was reported in full swing during the year. Road construction to the site was underway; machine shops and workers' housing were under construction. The 1,664-megawatt powerplant and dam is sited just upstream of Hoa Binh, about 60 kilometers west-southwest of Hanoi. The Soviet Union was providing technical and economic aid for the construction.

Vietnam is not a major producer of any minerals by world standards. Production of coal, phosphate, chromite, tin, antimony, iron ore, brick, cement, and zinc, however, is sufficient to furnish the country's needs at this time. Modest amounts of coal, tin, and phosphates are exported. Data on production are seldom specific. The available figures are frequently stated in terms of percent increase over an unstated or unknown base period.

Cognizant of the value of mineral resources, the Government actively encouraged prospecting and evaluation of various mineral deposits throughout the country. The Government planned to develop local minerals, especially those that were needed to meet the immediate needs for fuels and raw materials required by industry, agriculture, and infrastructure. The Fourth Party Congress indicated that the mining sector must "both build large, modern enterprises and extensively develop medium- and small-scale enterprises in the localities."[41]

Some of the minerals mentioned in the press in 1977 as being slated for more detailed investigation, development, or exploitation included: Bauxite, copper, graphite, lead, manganese, silver, and titanium. Even if rich and sizable mineral deposits were to be found and exploited, a great deal of financial and technical resources would

Digitized by Google

be required to bring them into commercial production. Most of the minerals are located in remote and rugged areas. The problem of transport alone could delay development of even some quite promising deposits.

Most promising in the long run may be the oil discovered offshore southern Vietnam by western companies in 1974. Undoubtedly, development of the fields would be most beneficial to the country's economy. No oil or natural gas was produced in the country during 1977. Again, a great deal of capital investment and sophisticated technology would be needed to bring the deposits into production and would necessitate external assistance.

COMMODITY REVIEW

Metals.—Antimony was known to be mined in the country and refined in the north at a small plant completed in 1976. Chromite is mined at one known location, Co Dinh in Thanh Hoa Province. Production reportedly exceeded the planned quota for 1977 and also probably exceeded the 9,000 tons of ore mined in 1976. The 1978 production target was to be a 25% increase over that in 1977. Some of the ore is probably made into refractory brick for furnace linings and the remainder exported to socialist countries as bulk ore. There is no ferrochromium plant in Vietnam.

In late 1977, a French steel engineering company signed a provisional contract to expand and modernize the facilities at the Thai Nguyen iron and steel complex. Some Japanese firms were also negotiating a contract for work at the same plant. Modifications to be included were a small blast furnace (250,000 to 500,000 tons per year) and two 30-ton converters to be purchased from the Japanese. The French would furnish engineering expertise, a continuous steel casting mill, and a bar and angle rolling mill. Vietnam was to provide all necessary improvements to infrastructure before start of construction. Thai Nguyen was reportedly producing pig iron at a rate of 450 tons per day in late 1977. The Nui Coc dam, under construction throughout 1976, was completed in 1977. The reservoir will store 175 million cubic meters of water to supply the cooling needs of the Thai Nguyen complex and for nearby irrigation projects.

Iron ore for Thai Nguyen was supplied mainly from the nearby Trai Cau mine. Large iron ore reserves have been reported in the highlands about 100 kilometers south of Da Nang. Vietnam is not self-sufficient in steel production and imported at least 130,000 tons of steel products from Japan in 1977. The U.S.S.R. and Eastern European countries may also have supplied additional amounts.

Tin was mined mainly in Cao Bang and also near Vinh and Viet Tri. Concentrates were refined at the Tinh Tuc refining plant in Cao Lang Province, northeast of Hanoi. Production of tin-in-concentrate was estimated between 200 and 250 tons in 1977. The 1978 production plan called for a 17% increase in tin metal. Some tin was exported to the U.S.S.R.

Zinc ore deposits are found at Trang Da and Cho Dien, and a small zinc smelter is located at Quang Yen. There was no mention in the press during the year of zinc output or projected increases in the 5-year development plan. Production was probably quite low.

Nonmetals.—Because a shortage of building materials continued to plague construction in 1977, the Government sought to increase the level of brick and construction tile production in every way possible. Local districts, especially those in the southern provinces, were urged to open clay pits and to develop small- and medium-scale brick kilns of 1 to 7 million pieces per year capacity. This could be accomplished quickly with modest investment and using locally made equipment and local labor. Mechanization and expansion would come later as equipment and funding became available. Construction also continued on large plants. The large (20-50 million brick) Gieng Day factory was completed during 1977. Location of this facility was not disclosed. Brick plants with capacities of between 7 and 20 million brick were completed during the year at Trung Gia, Chien Thang, Te Tieu, and Krong Pach. At least four others were under construction.[42]

The planned brick production in 1978 was to be 3.5 billion units, a 14% increase over output in 1977, indicating a small shortfall of 0.13 billion brick from the 1977 target of 3.2 billion. In 1976, production was 2.4 billion brick and 0.5 billion tile. Tile production was believed to have dropped a small amount in 1977. The brick and tile production represents a dry weight of clay of over 9 million tons for the year, the largest mineral output by weight in Vietnam.

Vietnam produced about 700,000 tons of cement in 1977, about 18% of which was from various small local kilns. There were

Digitized by Google

only two rotary kiln plants operating in 1977, one in Haiphong in the north, the other in Hà Tiên in the south. Authorities were striving to increase output with a large expansion program, both in building more small local kilns and in using foreign aid in the construction of large modern rotary kiln plants. The state plan called for completion in 1978 of 26 local plants, each with a capacity of 5,000 to 10,000 tons per year. Planned output for 1978 was 986,000 tons.

The second 5-year plan envisioned increasing cement output to 2 million tons by 1980. In late stages of planning or under construction were rotary kiln plants at Binh Son (Soviet assistance for a 1.2-million-ton-per-year plant); Hoang Thach (Japanese and Danish assistance for a 1.0-million-ton-per-year plant); and Ha Tien (French assistance for a 1.0-million-ton-per-year expansion of the old plant). Also planned were large plants at Phu Ly and Thanh Hoa.

Lime production was also important to the Vietnamese economy. Installed capacity yearend was reported at 2 million tons, and production was probably near that level. The current development plan called for an output of 3 million tons by 1980. About 80% of production goes to the agricultural sector.

In order to support the drive for higher crop yields, the Government placed a high priority on developing the fertilizer industry. Over 20 new fertilizer plants were under construction or put into operation during 1977. These were mostly apatite grinding plants of various capacities. A few had capacities of 20,000 tons per year and others, 100,000 tons per year, but most were apparently standardized plants rated at 40,000-60,000 tons per year. Some of the plants had roasting facilities to improve the solubility of the apatite before grinding.

Most of the apatite production was from the large Lao Cai (Laokay) mine near the Chinese border in the northwest. Total production was certainly well over 1 million tons in 1977. Efforts were being made to increase the mine output, from 1.5 to 3.0 million tons by 1980.

Vietnam's total exports of phosphate were substantial but probably did not reach 1 million tons. Phosphate fertilizer production was reported at from 416,000 tons to 497,000 tons in 1977 (not designated as to P_2O_5 content or gross weight). The 1978 output of all types of phosphate fertilizer was planned at 740,000 tons, a nearly 50% increase. In addition, production of pulverized apatite ore for direct crop application will be doubled to 393,000 tons in 1978.

The only modern nitrogenous fertilizer factory was the Ha Bac plant in Bac Giang City. The plant was originally built in 1965 with Chinese aid then subsequently damaged. Reconstruction began in 1973 and work was reportedly completed in late 1976. Trial operations began soon afterward and an official inauguration was held in October 1977. The plant was believed to have a capacity of 54,000 tons per year nitrogen content of ammonia plus a downstream urea capability. About 20,000 tons of urea fertilizer (nitrogen content) were produced by the end of the year. Vietnam lacks self-sufficiency in nitrogen fertilizers, and imports of significant quantities will continue, even with the reopening of the Ha Bac plant.

The Haiphong glassworks reopened in October 1977. The plant was rebuilt and modernized with assistance from the German Democratic Republic. The plant will produce 20,000 tons per year of glass from domestic sands and other locally produced raw materials.

Mineral Fuels.—Presently coal is by far Vietnam's most important mineral commodity. Reserves of high-grade coal, mostly anthracite, total several billion tons. Production has been climbing steadily since 1973, and in 1977 the washed coal output was reported at just over 6 million tons. Government plans called for a target of 7 million tons in 1978 and 10 million tons in 1980. New mines were being built; old ones, modernized; and transportation, storage, and loading facilities were being improved. In 1978, capital investment in coal mine development was to increase 50%, raising the total labor force in the industry to 30,000 persons. In order to attain the 1978 goal, overburden removal at the open pit operations increased 42% and totaled over 22 million cubic meters in 1977.

Coal was Hanoi's best foreign exchange earner in the mineral sector. Most of the exports went to Japan, with smaller amounts shipped to a few nearby countries. Exports to Japan were revised to 503,000 tons in 1975.

At the beginning of 1977, nine foreign oil companies were negotiating with Petrovietnam (the state-owned Vietnam oil and gas company) for drilling rights off the Mekong Delta, south and east of Ho Chi Minh City. Norway had already signed the

Digitized by Google

first agreement in late 1976. By late summer of 1977, Petrovietnam had signed agreements with three European consortia: Agip (ENI) of Italy, Elf Acquitaine of France, and Deminex Deutsche Erdol Versergungs-gesellschaft MBH of the Federal Republic of Germany.[43] Late in the year, a group of Canadian companies headed by Bow Valley Industries Ltd. signed a contract for rights in blocks 01 and 02. Although late to sign, Bow Valley had an advantage on the other firms because it had done extensive geophysical surveying work on these tracts in 1973. All agreements were preliminary in nature and binding contracts defining specific terms and payment conditions were still to be worked out at yearend.

A petroleum discovery by Vietnamese oil workers, aided by Soviet technicians, was reported by the press in April. The strike was in Thai Binh Province in the Red River Delta. Vietnamese officials said the find has the potential for commercial production. Unusually high down-hole temperatures complicate drilling efforts in the Delta.

There was no oil or natural gas produced in Vietnam in 1977. Combined north-south consumption of imported petroleum products was from 2- to 2.5 million tons in previous years. The 1976 plan called for stringent conservation measures and a total of only 1.6 million tons of imports. It was not known if this goal was met. Because of increased needs in the transportation, agriculture, and military sectors, the consumption figure for 1977 was probably around 2 million tons.

BAHRAIN[1]

Bahrain's oil revenue increased from $337 million[2] in 1976 to $378 million in 1977. Despite the increase in value, petroleum receipts made up only 59% of all Government income in 1977, compared with 74% in 1976 and 83% in 1975. Bahrain became an oil producer in 1932 with the discovery of the Awali oilfield, and since that time, the Awali oilfield has produced over 600 million barrels of crude oil. Awali production in 1977 was 21.2 million barrels. Bahrain shares the revenue from the Abu Safah oilfield, located in the Persian Gulf north of Bahrain, equally with Saudi Arabia. Revenue from the Abu Safah oilfield was approximately $179 million or 47% of oil revenues in 1977. Output from the Abu Safah oilfield was 48 million barrels, an increase of nearly 30% over 1976 output.

The Bahrain Petroleum Company (BAPCO), the nation's only oil-producing company, was owned 40% by California Texas Oil Corp. (CALTEX) and 60% by the Government. The Government established Bahrain National Oil Co. (BANOCO) in 1976 to administer the Government's share of BAPCO, oversee exploration concessions, and manage domestic marketing of petroleum products. The Government announced its intention to acquire 100% control of crude oil and natural gas production. CALTEX was to retain complete control of the 250,000-barrel-per-day oil refinery near Sitrah.

During 1977, the BAPCO oil refinery processed 95.2 million barrels of crude oil and blended stocks, averaging 260,800 barrels per day for a record-setting year. The refinery processed all of Bahrain's crude oil output and an additional 73.2 million barrels of crude oil that was supplied from Saudi Arabia by pipeline. The BAPCO refinery is an export-oriented enterprise and feeds a tank farm on Sitra Island. Petroleum products from the tank farm were pumped 3.5 miles to a six-berth, deepwater marine terminal. The terminal can accomodate vessels up to 110,000 deadweight tons. Refinery storage capacity was 7 million barrels for petroleum products and 6 million barrels for crude oil.

During 1977, natural gas production in-

Digitized by Google

creased 12.7% from 8.34 million cubic meters per day to 9.4 million cubic meters per day. Production came from the Permian Khuff formation, which occurs between 8,500 feet and 10,500 feet and is below the Bahrain formation (1,800 to 2,300 feet). Khuff gas was used to feed the 300-megawatt powerplant of Aluminum Bahrain Ltd. (ALBA), maintain pressure in the Awali oilfield, fuel the petroleum refinery's low-sulfur fuel oil complex and power station, operate the Government's powerplant at Jufair, and provide an energy source for desalination of seawater. Natural gas produced in association with crude oil, about 3 million cubic meters per day, was flared in 1977.

ALBA's 120,000-ton-per-year aluminum smelter, owned 77.9% by the Bahraini Government, 17% by Kaiser Aluminum Bahrain, and 5.1% by Breton Investment, produced 121,356 tons in 1977. The main products were standard, 22.5-kilogram ingot (95,100 tons), "T" ingot (10,100 tons), and extrusion billets (6,800 tons). Other products included liquid metal for local downstream industries and small amounts of conductor bars and anode rod for in-house use. Raw materials for aluminum production were imported from Australia (alumina and pitch), the United States (petroleum coke), and Italy and Japan (cryolite and aluminum fluoride). Most of the materials used by ALBA were received at the company's own bulk materials handling terminal that was on an artificially created 3-acre island, approximately 5 kilometers offshore on the edge of the eastern reef. A 170-meter-long quay with its unloading cranes was able to berth one 35,000-ton bulk carrier at its seaward berth and a 12,000-ton vessel at its landward berth. The island was connected to the smelter by a 10-kilometer aerial ropeway that had 156 buckets, each of 1-ton capacity. A causeway connected the island to the Sitra-BAPCO causeway, providing a road connection to the main Bahrain island.

ALBA has not expanded into semimanufacturing operations, but several small companies convert part of the smelter's output into other products. Bahrain Aluminum Extrusion Co., a Government-owned enterprise, began production in March 1977. The company produced mainly architectural sections and had a rated capacity of 4,000 to 5,000 tons per year of anodized extrusions. Output in late 1977 averaged approximately 250 tons per month. Bahrain Atomisers International was located close to the ALBA smelter and used liquid aluminum for the production of aluminum powder. During 1977, Midal Cables Ltd. was formed as a joint venture between Intersteel of Bahrain (51%) and Olex Cables of Australia (49%). The company began construction of a facility adjacent to the ALBA smelter in 1977 and was to be in full production by mid-1978. A holding furnace was to accept liquid aluminum from ALBA and feed a continuous-casting and rolling section for the production of 3/4-inch-diameter rod, that would be drawn into aluminum cable. Planned capacity was 15,000 tons per year of aluminum cable to be marketed in the Persian Gulf area.

Bahrain continued to import large quantities of cement during 1977. In November, the Government of Bahrain and Saudi Cement Co. signed an agreement with Ishikawajima Harima Heavy Industries Co., Ltd. of Japan to build a four-kiln, 6,000-ton-per-day cement plant. The cement plant was to be erected near Ain Dar in Saudi Arabia's Eastern Province and was to be in full operation in 1982.

The construction phase of a major shipyard facility was concluded in December with the inauguration of the drydock at the Arab Shipbuilding and Repair Yard Co. The shipyard was built on a 124-acre site reclaimed from the sea off the southeastern end of Muharraq Island. The major feature of the facility was a 375-meter-long by 75-meter-wide drydock that could accommodate vessels of up to 500,000 deadweight tons. Sill depth at the dock's gate was 9 meters. The shipyard was sponsored by the Organization of Arab Petroleum Exporting Countries (OAPEC) and was the largest facility of its kind between the Suez Canal and Singapore.

Expansion of Bahrain's major port, Mina Sulman, was underway in 1977 to increase the number of berths from 8 to 13 and to enlarge open storage areas. Improved handling procedures and the hiring of contract dock workers essentially eliminated the ship waiting time, which had been as high as 70 days. The port handled 1.52 million tons of cargo in 1977 and docked 781 vessels. A large volume of Bahrain's imports was reexported to Saudi Arabia, Qatar, and the United Arab Emirates during 1977.

JORDAN[3]

Jordan's gross national product (GNP) increased from $1.5 billion[4] in 1976 to approximately $1.8 billion in 1977, with the contribution of the mineral sector remaining unchanged at 15%. The economy continued to suffer from a growing balance-of-trade deficit, an inflation rate estimated at 14%, a large external debt, and slow industrial expansion. Under the current 5-year plan (1976-80), which scheduled a total expenditure of $2.4 billion, 25% of the plan's allocations was to be invested in the industrial and mineral sector. In 1977, phosphate mining and cement production were the only major industries based on local mineral deposits. Under the 5-year plan, the expansion of phosphate operations was to provide the basis for a domestic fertilizer industry. Other projects included production of potash from the Dead Sea and doubling of production of cement and refined petroleum products. Potential commercial deposits of copper, manganese, uranium, and vanadium were to be further explored and studied.

The Jordanian Government maintained an important equity position in most mineral enterprises and usually acquired a majority interest in new mineral ventures. Recent laws and a new investment code sought to encourage foreign investment, both public and private, in the mineral and industrial sector. In 1977, new investment guarantees were issued, exchange controls were eased, and restrictions on the import of raw materials were removed.

Infrastructure development was to aid in mineral development. Under the 5-year plan, approximately $40 million was to be spent to expand and improve Jordan's rail system. Projects included rehabilitation of a 25-kilometer link between phosphate deposits at El Hasa and Menzil, a 200-kilometer rail line to ship potash from the Dead Sea to the port of Aqaba, and a 150-kilometer railroad from El Hasa to Amman. A major electric power station, which was to be the country's largest, was to be built at Aqaba. The $30 million installation was to have three steam-powered turbine generators with a total capacity of 120 megawatts.

Jordan's phosphate production remained

Digitized by Google

at the 1976 level of 1.8 million tons. Exports increased from 1.65 million tons in 1976 to 1.7 million tons in 1977, going to the following destinations: Asia 58%, Eastern Europe 27%, and Western Europe 14%. However, revenues from phosphate sales decreased from $55 million in 1976 to $49 million in 1977, owing to lower world phosphate prices.

Under the 5-year plan, phosphate production capacity was to be increased from 2 million tons to 6 million tons per year by 1980. Jordan Phosphate Mines Co. Ltd., in which the Government held 82%, operated two major mines: The El Hasa mine, 200 kilometers north of Aqaba, and the Ruseifa mine, 15 kilometers northeast of Amman. Production was to be increased at El Hasa from 1.2 million tons to 2.4 million tons per year from the opencast mine, and a 1.8-million-ton-per-year underground operation was to be developed at that location. A smaller expansion project was scheduled at Ruseifa to increase production capacity from 800,000 tons to 1 million tons per year. Development continued on a third mine at Shidiyah, 130 kilometers northeast of Aqaba. Jordan's phosphate reserves were estimated at 2.5 billion tons.

In 1977, Jordan Phosphate Mines ordered technical equipment for analyzing the uranium and vanadium content of Jordan's phosphate deposits. It was estimated that Jordan had reserves of 200,000 to 300,000 tons of uranium and nearly 1 million tons of vanadium associated with phosphate rock. Discussions were in progress with foreign firms regarding the recovery of uranium from phosphoric acid as a byproduct of fertilizer manufacture.

Jordan Fertilizer Industry Co. continued to seek financing for its planned $325 million phosphate fertilizer complex in Aqaba. In 1977, Mitsui & Co. Ltd., Inc. (Japan) was contracted to provide technical and management services for the chemical fertilizer plant. Construction was to be by Spie-Batignolles S.A. (France) and Badger Co., Inc. (United States) under contracts concluded in 1976. Site clearance began for the complex, which was to produce 1,800 tons per day of sulfuric acid, 1,000 tons per day of phosphoric acid, and 2,000 tons per day of monoammonium and diammonium phosphate. After the withdrawal of Agrico Chemical Co. (United States) in 1976, shareholders in the project were the Jordanian Government (52%), the Jordan Phosphate Mines Co. (25%), International Finance Corp. (5%), and private interests (18%). The Jordanian Government was in the process of seeking additional financial partners. In 1977, loans for the fertilizer project had been received from France ($50 million), Abu Dhabi ($30 million), Kuwait ($25 million), and Libya ($20 million).

Arab Potash Co. awarded Jacobs Engineering Co. (United States) a $425 million contract for construction of its Dead Sea potash project. Arab Potash was owned 51% by the Jordanian Government, 25% by Arab Mining Co., 15% by the Saudi-based Arab Investment Co., and 9% by private interests. The project was to process carnallite, produced by solar evaporation of Dead Sea brines, to yield 1 million tons of potash per year. Production was to begin in 1981 and increase to 1.2 million tons per year by 1984 and 10.7 million tons per year by 1990. Reserves of potash in Dead Sea waters were conservatively estimated at 2 billion tons. Facilities were to include some 25,000 acres of dyked solar evaporation ponds at the southern end of the Dead Sea, a 10-kilometer canal linking the ponds to the processing plant, a 15-megawatt powerplant, and a new town to house 2,800 project and operating personnel. Other infrastructure included new access roads and an improved highway system linking the potash project with Amman (80 kilometers north) and Aqaba (200 kilometers south). The potash was to be initially transported by truck to Aqaba where a new shiploading facility of 50,000-ton capacity was under construction. At yearend, Arab Potash was seeking financing from the International Bank for Reconstruction and Development (IBAD), the Agency for International Development (AID), and Arab States.

The Jordanian Cement Co., which operated Jordan's only cement plant near Amman, produced approximately 566,000 tons of cement in 1977. Expansion was underway to increase capacity from 600,000 tons to 1.2 million tons per year by 1979 through the addition of a new dry-process kiln. The cement plant used raw materials quarried in the Amman area. Gypsum production from the Zarqa River gypsum deposit averaged 22,000 tons per year and was under the direction of Public Mining Co. Jordanian-Syrian Industrial Co. continued its feasibility study on construction of a 1-million-ton-per-year cement plant in southern Jordan.

The Mahiş kaolin mine, located near

Digitized by Google

Amman, produced approximately 6,000 tons of clay for use in the Amman ceramics factory. Feasibility studies were in progress on the construction of a plant to manufacture sheet glass and glass containers based on deposits of glass sand in the Aqaba area. Jordan also quarried marble and produced about 30,000 tons of salt per year for local consumption.

The Jordanian Natural Resources Authority contracted Seltrust Engineering Ltd. to conduct a feasibility study on exploitation of the Wadi Araba copper deposits. Reserves were estimated at 65 million tons of 1.3% copper ore. The Wadi Araba region also contained proven reserves of 1.5 million tons of manganese ore with estimated reserves of 5 million tons. Manganese prospecting was being conducted under the auspices of the Bureau de Recherches Géologiques et Minières (BRGM).

The only petroleum exploration carried out in Jordan in 1977 was by a group composed of Cie. Française des Pétroles (CFP) (37.5%), Fuyo Petroleum Development Corp. (37.5%), and Filon Exploration Corp. (25%). CFP and Fuyo Corp. acquired their 37.5% holdings in the production-sharing agreement awarded to Filon in April 1975. Their 30-year concession covered an 8,000-square-kilometer area on the eastern bank of the northern Jordan River. The group planned to spud a wildcat well near Ramtha, 90 kilometers north of Amman near the Syrian border; later, the group planned to drill on the eastern shore of the Dead Sea. The consortium was to bear all exploration and development costs and receive 35% of production revenues in the case of commercial discovery.

The Zarqa refinery, situated 25 kilometers from Amman, processed about 24,000 barrels per day of petroleum in 1977. Approximately 300,000 barrels of petroleum products was exported to Lebanon and Syria, with the remainder consumed locally. Crude oil was imported from Saudi Arabia by way of the Trans-Arabian Pipeline TAPline, although the question of Jordan's outstanding debt to TAPline for petroleum shipments remained unresolved. Construction work continued on the expansion project designed to raise the refinery's production capacity to 60,000 barrels per day by 1978. In 1977, the refinery's lubricating oil blending and canning plant was completed and commissioned. At yearend, Jordan Petroleum Refinery Co. Ltd. signed a $100 million loan agreement with a group of international banks to help meet financial commitments stemming from the expansion project.

Table 3.—Jordan: Exports and reexports of mineral commodities

(Metric tons unless otherwise specified)

Commodity	1975	1976	Principal destinations, 1976

LEBANON[5]

In 1977, Lebanon gave priority to economic reconstruction after the extensive damage suffered in the civil conflict of 1975-76. Less than 5% of the gross national product (GNP) was derived from the mineral sector, which consisted primarily of cement manufacture and petroleum refining. The economy was based largely on the services sector, specifically banking, commerce, and tourism. The Board for Reconstruction and Development focused its efforts on reviving the financial center of Beirut and rebuilding the country's infrastructure. A $150 million[6] loan was received from several Western European countries for infrastructure development, and a $35 million loan was received from the European Investment Bank to finance power projects. The port of Beirut, previously one of the busiest trading centers in the Middle East, was being reconstructed and was opened to limited shipping in December 1976. The northern port of Tripoli was also to undergo repairs and expansion in 1978.

Lebanon reached an agreement with Saudi Arabia in 1977 whereby the latter would assume Lebanon's debts, estimated at $123 million for previous imports of crude oil. In 1977, Lebanon imported Saudi Arabian light crude for processing in its two refineries at a delivered price of $12.68 per barrel. The Tripoli refinery, which was nationalized in 1976 after the closure of the Iraq National Oil Company (INOC) pipeline, was operating at a near normal level after being reopened in May 1977. The 30,000-barrel-per-day refinery processed approximately 6.6 million barrels of petroleum during the year. At yearend, the Lebanese Government concluded an agreement with TAPline for deliveries of crude at a price of $13.29 per barrel for 1978.

Lebanon's other refinery at Zahrani, just south of Sidon, operated at much less than its 17,500-barrel-per-day capacity in 1977. Also supplied by deliveries of Saudi crude over TAPline, the refinery produced about 3.3 million barrels of petroleum products during the year. Although owned by the Mediterranean Refining Co. (Medreco), which in turn was owned by CALTEX and Mobil Oil Corp., the refinery was taken under Government sequestration in 1973 following a price dispute with TAPline. In 1978, TAPline was to supply crude oil to the Medreco refinery at a price of $13.10 per barrel.

In 1977, Lebanese Pipeline Co., owned 51% by the Lebanese Government, was considering the construction of a petroleum pipeline to link Beirut with the refineries at Tripoli and Sidon. The 150-kilometer pipeline was to cost about $30 million and be completed by 1979.

Lebanon produced approximately 1.4 million tons of cement in 1977 at its three cement plants located at Chekka, South of Tripoli. The Soc des Ciments Libanais plant was to be expanded from 1.2 million tons to 1.8 million tons per year by 1979. Also, the Soc Libanaise des Ciments plant was to be expanded from 50,000 tons to 160,000 tons per year, also by 1979. A 450,000-ton-per-year plant was operated by Cimenterie Nationale S.A.L. The three plants used gypsum and limestone quarried near Tripoli.

The triple superphosphate plant owned by Lebanon Chemicals Co. began limited production in mid-1977 after being closed during the 1976 disturbances. The plant had an annual production capacity of 100,000 tons of fertilizer. Phosphate rock was imported from Syria.

OMAN[7]

The prospects for halting Oman's declining oil production were brighter in 1977 because of new oil discoveries in the southern Dhofar Province. Petroleum production reached a peak in 1976 and started to decline in 1977. Overall petroleum reserves previously expected to be depleted in about 20 years unless significant new deposits were found. Oman's Government was turning its attention to revenue-generating projects such as copper, cement, and steel plants, although nothing was expected to entirely compensate for the expected drop in oil exports. Petroleum was Oman's most significant foreign exchange earner, contributing 64% to the 1977 Government revenues of $2,098 million.[8] Loans and grants during 1977 totaled $645 million, representing mostly Saudi Arabia and Abu Dhabi capital. These funds included specific loans for new Dhofar petroleum development, and for the Sohar copper project.

The Oman Development Bank was formally incorporated on December 18, 1977. The major shareholders included the Government of Oman (40%); Kuwait Trading,

Digitized by Google

Contracting and Development Co. (10%); Arab Bank Ltd. (5%); Hong Kong & Shanghai Banking Corp. (5%); the National Bank of Oman (2%); The Chartered Bank, Muscat (1%); and Grindlays Bank Ltd. (1%). The new bank will operate in all fields of development, including oil.[9]

The Government places few restrictions on the operation of foreign companies. For most companies (except banks and specifically exempted organizations), the Omani share of capital and profits was to be not less than 35%. Company income tax started at 20% of net profits, but if the Omani share of capital and profits was at least 51%, the income tax rate began at 15%. Tax holidays of 5 years were available for firms engaged in industrial development. There were no personal income taxes. Oman is eligible for the U.S. General System of Preferences (GSP) tariff law for its exports to the United States, but exports other than petroleum are practically nonexistent. Duty-free importation of raw materials to companies in basic industrial sectors such as cement is also available. In order to decrease Oman's dependence upon oil, diversification of the economy toward other minerals and light industry was being encouraged by the 1976-80 5-year plan. Investment prospects are limited by a shortage of skilled labor and by the need to import most goods.

For the first time since 1973, Oman achieved a balance-of-trade surplus in 1977. In value, exports (over 99% petroleum) remained at 1976 levels, although in quantity, petroleum exports actually fell from the record high of 134.4 million barrels in 1976 to 122.0 million barrels in 1977. Over 50% of Oman's crude oil exports in 1977 went to Japan. Other importers included the United States (15.4%), the Netherlands (9.1%), Curaçao (9.1%), France (3.8%), Sweden (3.4%), and Norway (3.1%). The United Kingdom, Italy, the Federal Republic of Germany, Portugal, and the Ivory Coast all imported 1% or less of Oman crude. Imports also remained similar to those of 1976 in value, estimated at $1,058.5 million in 1977. In the first 6 months of 1977, Oman imported a total of 4.5 million barrels of refined petroleum products from Iran (78%), Bahrain (7%), Saudi Arabia (2.6%), and Kuwait (1%). Total refined petroleum imports for 1977 were valued at $60 million.

The Omani Government was planning a 30,000-barrel-per-day oil refinery for internal use near the tanker-loading facility at Mina al Fahal. The feasibility study was being done by Shell Oil Co., and the project was expected to cost $130 million. Several United States, Western European, and Japanese firms had made inquiries.

Petroleum production from the northern fields averaged 339,000 barrels per day in 1977, but was expected to fall to around 219,000 barrels per day by 1981. In early 1977, the Oman Government set oil prices at a new buy-back price of $12.72 per barrel of 34° API gravity crude, which was a 7.3% rise over the market price at yearend 1976 and a 9% rise over the official buy-back price of $11.67 per barrel. The Government decided to maintain an official selling price for 34° API gravity crude of $13.00 per barrel for January 1978.

Petroleum exploration was active in 1977 in both northern and southern areas. In the western Butabul region near the Saudi border, Wintershall Aktiengellschaft of the Federal Republic of Germany had acquired a 20% interest in the Elf-Aquitaine/Sumitomo Petroleum Development Co., Ltd., (Japan) venture. Elf-Aquitaine (60%) and Sumitomo (40%) acquired the 7,000-square-kilometer tract under a production-sharing agreement in May 1975. Elf-Oman, the operator, completed seismic surveys and planned to drill the first deep exploration well in February 1978. Two U.S. companies, Gulf Oil and Quintana, were exploring an onshore concession at Sunaina near the United Arab Emirates border. Quintana was to be the operator. The West German firm Deminex AG (Federal Republic of Germany), Agip S.p.A. (Italy), and British Petroleum Co. Ltd. (BP) signed a concession agreement in Dhofar in late 1977. The consortium was obligated to spend about $40 million on exploration and development in a 64,000-square-kilometer Dhofar concession.

A new petroleum discovery, 20 kilometers west of Amal at Qahira, was described as encouraging and was expected to produce a lighter crude (30° API gravity) than the Amal-Marmur crude (20° to 24° API gravity and high (3% to 4%) sulfur). This discovery allowed Petroleum Development (Oman) Ltd. (PDO) to revise its plans for transporting oil from the Dhofar Province. PDO planned to build a 500-kilometer, crude oil pipeline from Dhofar Province to the existing export terminal at Mina al Fahal, instead of to Salalah in southern Oman as originally planned. This pipeline would be

Digitized by Google

used in the development of the Marmur and Amal fields having initial capacities of 20,000 barrels and 10,000 barrels per day, respectively. Up to 70 development wells were to be drilled by 1980 at Dhofar. The new Dhofar Fields production was to be used to partially offset falling output from the northern fields, expected to decline at a rate of about 10% per year.

Natural gas reserves were estimated at 240 billion cubic meters. Gas was being produced commercially at the rate of 48 million cubic meters per year, but the greater part was still being flared. A natural gas pipeline was under construction that was to conduct gas from the Yibal oilfields to the Ghubra area power station, a distance of 320 kilometers. The gas was to be used at Ghubra for electric power and desalination plants, and for industry. A spur of the pipeline was to be laid to Sohar for the planned copper project. A natural gas liquids (NGL) plant was under construction at Yibal and was to be onstream by late 1978. PDO was also building a smaller NGL plant at the Saih Rawal Field that would produce 1,100 barrels per day of light oil. This plant, which utilized a new French thermal cooling process, came onstream at yearend 1977.

An asbestos cement pipe factory was completed by Amiantit-Oman Co. in the Industrial zone at Rusayl, 20 kilometers inland from Seeb, and began production in 1977. Operated as a joint venture by Amianti of Switzerland and Bahwan, an Omani firm, the rated capacity of the plant was 36,000 tons per year. Oman Cement Co., owned 40% by Kuwait Cement Co. and 60% by the Omani Government, was planning to construct a cement factory and packing plant in the Barka industrial zone near Muscat. The plant was to cost about $210 million to construct and would have an eventual capacity of 1 million tons per year. Production was planned for 1980, when about 40% of the plant output was to be exported as clinker to Kuwait. The rest was to satisfy internal needs. A new port near Barka, 60 miles north of Muscat, was to be built to handle the cement trade.

Oman Mining Co., owned 75% by the Omani Government and 25% by Marshall Oman Exploration Co. and Prospection Ltd. of Canada, was starting to develop four northern copper deposits, which together were estimated to contain 20 million tons of 2% copper ore. Saudi Arabia had agreed to lend $100 million of the total $120 million to $140 million needed for development of the mines, a concentrator, and a small local smelter. A new port facility, housing, and roads, as well as a 200-kilometer gas pipeline from Ghubra in the capital area to Sohar for a 30-megawatt powerplant and smelter fuel, were also to be built. The complex would employ 400 to 500 persons. Production was scheduled for startup in 1980, at which time 20,000 tons of refined copper was to be produced per year. Roughly 3,500 tons of ore was to be processed per day.

In addition to the copper sites described above, which were located 50 kilometers from Sohar along the Wadi Jizzi, other deposits were reported. About 4 million tons of copper ore was reported at Rakah, located on the southern side of the Jebel Akhdar mountain; other small deposits were located at Sharquiya, near Rostag, and near the United Arab Emirates border.

The Omani Government was planning to build a steel-rolling mill and was negotiating with several companies for its construction. The mill would produce 120,000 tons per year of reinforcing bars, using 100-millimeter-square billets as feedstock. Associated with the mill, the Government was proposing a gas-fired, 400,000-ton-per-year, direct-reduction plant that would use 600,000 tons of imported iron ore pellets per year, and a 200,000-ton-per-year electric steel plant using some of the resultant sponge iron.[10]

Other mineral deposits under consideration for development included chromite (5 to 10 million tons), asbestos (9 million tons), anthracite (10 million tons), and large deposits of limestone. Phosphate rock and small copper deposits were reported in southern Dhofar Province. There were also indications of magnesium, nickel, and iron deposits. Several Western European firms were showing interest in development of the asbestos, which was probably chrysotile. A West German economic and trade delegation visited Oman in late 1977. The most immediate interest was the petroleum and minerals sector. The Federal Republic of Germany was interested in following up on a preliminary survey made by a fact-finding group in April 1976 and early 1977 on minerals of Dhofar Province, as well as in northern Oman. Metallgesellschaft AG also discussed copper and chromite mining participation and the planned steel-rerolling mill.

QATAR[11]

Petroleum revenues accounted for over 70% of Qatar's 1977 gross national product (GNP), estimated at $3 billion[12] at current prices. With petroleum reserves expected to last at least 25 years and natural gas reserves potentially for hundreds of years, Qatar was making plans for rapid-pace development. Projects for establishing direct-reduction steelworks, petrochemical and NGL plants, and additional cement capacity were already in progress. Crude oil production was limited to a level sufficient to provide funds to proceed with industrial development, but was planned to start a gradual decline by the second half of the 1980's. The Government's production conservation policy set a ceiling of about 500,000 barrels per day. Qatar is a member of the Organization of Petroleum Exporting Countries (OPEC) as well as OAPEC.

In late 1976, the Government of Qatar became the owner of the Qatar Petroleum Co. Ltd. (QPC) in Dukhan, and in 1977, it completed nationalization with 100% acquisition of Shell Co. of Qatar Ltd. (SCQ). Qatar General Petroleum Corp. (QGPC) controlled marketing, and the Qatar Petroleum Producing Authority (QPPA) was formed in 1977 to regulate production. Qatar's oil production came from two main areas, one onshore at Dukhan, and the other a cluster of three offshore fields east of the Qatari peninsula. Both QPC and SCQ formed service companies to carry out management services under contract with QPPA. Dukhan Service Co. Ltd. (DSC), owned by QPC, was to operate the onshore areas at Dukhan, while Qatar Shell Services Co. (QSSC), owned by Shell (80%) and Italy's Ente Nazionale Idrocarburi (ENI) (20%), would continue to operate the offshore fields. Qatar was also entitled to one-half of the petroleum production from the Al Bunduq Field, shared with Abu Dhabi and operated by Al-Bunduq Oil Co., which was owned by British Petroleum (33-1/3%), Compagnie Française des Petroles (33-1/3%), and Petroleum Development Company of Japan (33-1/3%).

Crude petroleum production in 1977 was 162.3 million barrels, down about 10% from that of 1976. QPPA averaged a total of 435,145 barrels per day from both onshore and offshore fields. In addition, Qatar's 1977 share of production from the offshore El Bunduq Field, which straddles the border between Qatar and Abu Dhabi, amounted to an average of 9,476 barrels per day. The total El Bunduq output of 18,950 barrels per day was down 7.4% from that of 1976; this was attributed to technical problems arising in the latter part of 1977.[13]

In 1977, petroleum exports were 149.8 million barrels valued at $2.2 billion. Of this, 82.9 million barrels was shipped from Halul Island, and the rest, from Umm Sa'id.[14] The Government held crude oil sales contracts with the shareholders of QPC and SCQ, as well as with Charter Oil Co., Petrofina S.A. (Belgium-Luxembourg), Gulf, Sumitomo (Japan), and Union Rheinische Braunkohlen Kraftstoff AG (Federal Republic of Germany). Total 1977 imports were valued at $1.3 billion, of which 50% came from the United Kingdom, Japan, the United States, and the Federal Republic of Germany. Imports from the United States increased from $16 million in 1972 to over $111.9 million in 1977, 10.5% of Qatar's total imports.[15]

All onshore oil came from the Dukhan Field, located on the western side of the Qatari peninsula. The 2,000-square-kilometer area had the potential to produce 280,000 barrels per day from three main areas—Khatiyah, Fahahil, and Jaleha—but in 1977 produced an average of only 200,274 barrels per day. Steady increases in field production have been assisted by secondary recovery methods (such as water flooding). The Dukhan Field had 94 wells, of which 60 were oil producers, 4 gas producers, and the rest shutin or water wells.[16] Offshore production came from three fields and had been as high as 370,000 barrels per day. Idd el-Shargi had 15 wells with a 1977 production of around 10,600 barrels per day; Maydan Mahzam had 11 wells, with a 1977 production of around 99,000 barrels per day; and farther east, Bul Hanine had 7 wells and was the most productive of the three with about 125,400 barrels per day in 1977.

Holcar Oil, an independent U.S. company, was exploring for petroleum in an 8,700-square-kilometer area off the eastern coast of Qatar. Wintershall, operator for the offshore concession to the northeast of the peninsula, was planning to spend $8 million on exploration for petroleum and natural gas in 1978. The Wintershall Group also

Digitized by Google

included Koch Oil International Co. of the United States, Veba-Chemie AG and Deutsche Schachtbau-und Tiefbohrgesellschaft mbH of the Federal Republic of Germany, and Gulfstream Resources Ltd. of Canada. Both companies were exploring under a production-sharing contract.

Acting through QPPA, the Qatari State company QGPC initiated an extensive, $7 million seismic evaluation of the entire North-West Dome exploration area. Located in Permian Khuff strata to the northeast of the peninsula, this 2,000-square-kilometer area was the site of the major natural gas discovery of mid-1976 by SCQ. The Qatar Gas Co., owned 70% by QGPC and 30% by Shell, was commissioned to do the feasibility study of a liquefied natural gas (LNG) export industry using North-West Dome gas.

The North-West Dome Field was being operated by QCS on a contract basis. The Permian Khuff gas reservoir development was to take place in three stages. The first involved developing five wells to produce 200 million cubic feet per day; two more wells in the second stage would boost production to 300 million cubic feet per day; the third and final stage included plans for seven additional wells, which would bring final production to 700 million cubic feet per day.

Onshore, QPPA produced 245 million cubic feet per day of associated and unassociated gas from wells of the Dukhan field. Marketed natural gas during 1977 was 148.6 million cubic feet per day, compared with 124.3 million cubic feet per day in 1976.[17] About 170 million cubic feet per day of natural gas continued to be flared from offshore fields, pending completion of gas utilization projects. Natural gas reserves were estimated to range from 30 trillion cubic feet to as high as 100 trillion cubic feet, including those in the North-West Dome field.

There were two NGL plants under construction at Umm Sa'id. Construction was started on NGL-II in early 1977 and was expected to be completed by mid-1979. Production of offshore associated gas at NGL-II would include 1,100 tons per day of propane, 900 tons per day of butane, and 900 tons per day of pentane. By yearend, construction of a new NGL-I plant had started to replace the plant that was destroyed in a fire accident in April 1977. When completed in 1980, the new NGL-I will produce 1,200 tons per day of propane, 750 tons per day of butane, and 450 tons per day of natural gasoline from onshore associated gases. A 1,200-billion-cubic-foot-per-year LNG project, expected to cost $3 billion, was under study.

Qatar Fertilizer Co. (QAFCO), owned 70% by the Government, 25% by Norsk Hydro A/S, 3% by the British Davy Powergas Co., and 2% by Hambros Bank Ltd., completed the QAFCO-I plant in 1973 and started work on the QAFCO-II project in 1975. QAFCO-II, expected to be completed in 1979, was to double the total production capacity to 1,800 tons per day of ammonia and 2,000 tons per day of urea. Approximately 300,000 tons of nitrogenous fertilizer was produced in 1977.

Qatar Petrochemical Co. (QAPCO) was building a petrochemical complex to produce about 280,000 tons per year of ethylene. Most of this production was to be processed onsite into polyethylene. The partners in QAPCO are the Government (84%) and CdF Chimie of France (16%). Gazocean, which previously had 5% of the project, withdrew, leaving its share to Qatar (4%) and CdF Chimie (1%). QAPCO's polyethylene production was planned for export to neighboring countries and Africa.

Qatar had two petroleum refineries, one with a 700-barrel-per-day capacity and one with a 9,500-barrel-per-day capacity; the latter was under expansion to 15,000 barrels per day. Production at the National Oil Distribution Co. (NODCO) refinery reached at Um Sa'id 2.32 million barrels in 1977, compared with 1.35 million barrels in 1975. Domestic consumption rose from 1.58 million barrels in 1976 to 2.62 million barrels in 1977, necessitating imports to cover the difference. A new refinery to serve mostly local needs was under study and was planned for completion in 1982 with a 50,000- to 80,000-barrel-per-day capacity.

Production from the Qatar Steel Co. (QASCO) direct-reduction steel plant at Umm Sa'id was to start in 1978. A joint venture between the Qatari (70%), Kobe Steel Ltd. (30%), and Tokyo Boeki Ltd. (10%), the steel mill was to have a capacity of 400,000 tons per year, mostly of reinforced steel bars. Approximately 70% of QASCO's bar steel was to be exported to nearby countries such as Saudi Arabia. Imported iron ore and pellets were to come from Australia, Brazil, and Sweden.

Digitized by Google

Cement production was to be raised from 300,000 tons to 580,000 tons per year capacity. A fourth cement furnace with a 900-ton-per-day capacity was to be added to the Qatar National Cement Co. Ltd. plant at Umm Bab in 1978. The cement plant at Umm Bab produced both portland and sulfate-resistant cement types. Cement consumption was up 17% in 1977 to 444,500 tons, of which about 270,000 tons was imported.

SYRIA[18]

Syria's mineral industry, based on the production of petroleum and phosphate, contributed about 13% to the 1977 gross domestic product (GDP), estimated at $6.5 billion.[19] Expenditures planned for the current 5-year plan (1976-80) were revised, and the plan was reissued in June 1977. Projects in the mineral sector included intensified petroleum and mineral exploration, expansion of phosphate production capacity, and completion of fertilizer, cement, and petroleum refinery projects already under construction. The plan relied heavily on external financing. In 1977, Syria received a total of $700 million in foreign aid, including $100 million from the United States.

Syria's petroleum production decreased from 70 million barrels in 1976 to 64 million barrels in 1977. Within the Ministry of Petroleum and Mineral Resources, the State-owned Syrian Petroleum Co. (SPC) was responsible for the exploration, production, and marketing of petroleum and petroleum products. Reserves were estimated at 2.2 billion barrels concentrated in five fields in the northeast of the country—Suwaidiyah, Karatchuk, Rumailan, Djubissa, and Olayan. The new Aliane Field came onstream in mid-1977 at an initial rate of 3,500 barrels per day. A 300,000-barrel-per-day-capacity pipeline carried crude oil from the producing fields by way

Digitized by Google

of Homs, where a small volume of oil was taken off for refining, to the Tartus export terminal on the Mediterranean Sea. In 1977, Syria exported about 60 million barrels of oil, with 85% going to Western Europe.

The Homs refinery operated at below capacity, which is estimated at 5.4 million tons per year. New desulfurization equipment, which was to enable the refinery to process a mixture of high-sulfur Syrian crude oil with imported light crude, was not yet in operation. The processing modification at the refinery was made necessary by the closure of the Iraq National Oil Co. (INOC) pipeline in April 1976. Iraq previously supplied Syria with over $100 million per year in transit fees, as well as with Iraqi light crude oil for refining at a substantial discount. In 1977, Syria imported approximately 2 million tons of oil from Saudi Arabia. The new refinery under construction at Bâniâs by Romanias' Industrialexport was also to undergo a modification of its refining process from a mixture of 80% Iraqi crude and 20% Syrian crude to a mixture containing 50% Syrian crude. The 6-million-ton-per-year refinery was to begin operation in 1978.

SPC, with technical assistance from the U.S.S.R., located several potential commercial oilfields in the past few years. The Tishreen, Salhié, Gehebeh, Keiba, and Mansoûr Fields, all located in the northeast of the country, were expected to add another 1 million tons to total production by 1980. Syria continued its policy of engaging international firms to assist in petroleum exploration, a significant departure from its earlier program of restricting petroleum development to partnership with the U.S.S.R. and Eastern Europe. The first U.S. group to be granted a concession area, the Tripco consortium, relinquished its acreage in 1976 after unsuccessful results. In 1977, Syria concluded a 25-year, production-sharing agreement with Syrian-American Oil Co. (SAMOCO), a division of Coastal States Gas Producing Co. The concession area covered a 15,750-square-kilometer area in the eastern Deïr-ez-Zor District. Contract provisions included recoverable company costs from 40% of production with the remaining output split 77-23 in favor of the Syrian Government. Syria also signed a production-sharing agreement with the Royal Dutch/Shell Group for a 22,000-square-kilometer area north of Palmyra. Pecten Syria was to act as operator, and minimum exploration outlays were set at $15 million. The only remaining foreign interest was Rompetrol of Romania, which was prospecting on a 9,350-square-kilometer tract in the northeastern part of Syria.

SPC was considering bids received for a $55 million project to gather and process associated gas from the Suwaidiyah, Karatchuk, and Rumaylan oilfields. In 1977, the major part of Syria's natural gas production, estimated at 65 billion cubic feet annually, was flared. The gas-gathering project included pipelines, compressor stations, processing units, and supporting facilities. Production would consist of liquefied petroleum gas (LPG), naphtha, light gas fuel, industrial solvents, and sulfur.

Production of phosphate rock decreased from 511,000 tons in 1976 to 425,000 tons in 1977 owing primarily to low world prices for the commodity. The price for Syrian phosphate rock fell from $53 to $30 per ton, causing output to fall to its lowest level in years. Nevertheless, Syria planned to expand production capacity to 3 million tons per year by 1980. Reserves at the three principal mines, Khunayfis, and Sharqiyah A and B, were estimated at 1 billion tons. Phosphate rock was transported by truck from the mines south of Palmyra to Tartus for export; a 240-kilometer railroad to link the mines with the export terminal was under construction. All of the production was exported, primarily to Romania, Bulgaria, and Czechoslovakia.

Three new fertilizer plants were being constructed under the supervision of the Syrian General Establishment of Chemical Industries (GECI). Syria's single facility at Homs produced approximately 26,000 tons of nitrogenous fertilizer in 1977. The new facilities were to allow Syria to meet all fertilizer needs with excess production for export. Industrialexport was constructing a 1,400-ton-per-day, triple superphosphate plant at Homs and a 1,000-ton-per-day, triple superphosphate plant at Deïr-ez-Zor. The two plants, costing a total of $300 million, were to begin production in 1979. Creusot-Loire (France) was managing contractor for a nitrogenous fertilizer plant under construction at Homs that was to produce 1,000 tons per day of ammonia and 1,050 tons per day of urea.

Exploitation of iron ore deposits in three areas of the country was under consideration by the General Establishment for

Digitized by Google

Geology and Mineral Resources. Reserves at deposits northwest of Aleppo, northwest of Damascus, and east of Hama were estimated at 90 million to 100 million tons containing 28% to 32% iron.

Syria's consumption of iron and steel products was predicted to increase from 300,000 tons in 1977 to 800,000 tons in 1980. The General Co. of Iron and Steel Products (GENCOSTEEL) recently expanded its iron and steel complex at Hama and was considering other projects to increase capacity. Three plants were in operation—a cold-rolling mill, producing 110,000 tons of iron rods per year; a metal pipe factory, with a capacity of 20,000 tons per year; and a 120,000-ton-per-year sponge iron smelting factory. Also under consideration were a 150,000-ton-per-year mill to produce galvanized sheet and tin plate, a 400,000-ton-per-year mill to produce bars and sections, and a 500,000-ton-per-year sheet steel unit.

Syria produced approximately 1 million tons of cement in 1977 from local gypsum and limestone deposits. Three plants were under the supervision of the General Organization for Cement. Chahba Cement Co. at Aleppo had a capacity of 580,000 tons per year, Syrian Cement Co. at Hama had a capacity of 460,000 tons per year, and National Co. for Cement at Dummar was rated at 280,000 tons per year. Plans were under consideration for the constructon of a 150,000-ton-per-year plant at Adra and a 200,000-ton-per-year plant at Tartus.

PEOPLE'S DEMOCRATIC REPUBLIC OF YEMEN[20]

The mineral sector of the People's Democratic Republic of Yemen, which consisted of the production of salt and the refining of imported crude oil, was a significant factor in the nation's economy. Refined petroleum products, which were exported largely to Western Europe, accounted for about 75% of the total export value. Other income was derived from the export of salt to Africa. The current 5-year plan (1974-78), which scheduled a total expenditure of $225 million,[21] planned an intensification of oil and mineral exploration and the development of industries using local raw materials. Economic development remained largely dependent on foreign funding, and the Government sought to restore diplomatic relations with the United States, which were terminated in 1969.

Nearly 25% of the expenditures in the 5-year plan were allocated to infrastructure development. The largest project was improvements to the port at Aden, which was one of the world's largest oil-bunkering ports prior to the closure of the Suez Canal. In November 1977, a new floating dock was commissioned at Aden. Completed renovation and modernization of the port was expected to cost $18 million. Mukalla, the only other port of significance in the People's Democratic Republic of Yemen, was the center of coastal trade for the eastern part of the country. Negotiations continued with Saudi Arabia regarding the construction of an oil export terminal on the Hadhramaut region's coast to be linked by transpeninsular pipeline to Saudi oilfields.

A grant of $1.8 million was received from the Abu Dhabi Fund for Arab Economic Development (AFAED) to finance mineral exploration. Hunting Geology and Geophysics Ltd. (United Kingdom) was contracted by the Board of Petroleum and Minerals to continue its mineral-prospecting program. The survey focused on copper occurrences in the Maahir-Ghabar area, 50 kilometers northwest of Mukalla, and on heavy minerals in beachsands along the coast. Sampling was conducted to confirm preliminary estimates of ilmenite, zircon, and rutile content of beachsands in five zones. Mineralogical and geochemical laboratories were established in Mukalla for the training of Yemeni personnel.

The refinery, previously owned by BP, was officially nationalized in May 1977. BP Refinery (Aden) Ltd., however, was contracted by the Government to continue management and operation of the refinery. The 160,000-barrel-per-day refinery was reported as operating at 25% of its rated capacity. Crude oil for refining was imported from Qatar, Kuwait, the United Arab Emirates, and other Arab States.

Both the Government and foreign companies continued petroleum prospecting under the supervision of the Board of Petroleum and Minerals. The Government centered its efforts on the Ras Fartak and Thamud regions. Siebens Oil & Gas Ltd. (Canada) drilled two wildcat wells in its 17,553-square-kilometer concession area in south

Digitized by Google

ern Socotra Island and its offshore area. The Soviet firm Technoexport continued exploration in its 10,000-square-kilometer tract of the Thamud area. In 1977, a new production-sharing agreement covering offshore waters of the eastern coast was concluded with Agip.

Salt production at the State-owned General Salt Organization facilities at Khawr Maksoir near Aden was approximately 75,000 tons per year. The production of unrefined marine salt from the evaporation of seawater employed approximately 100 workers. Work continued through 1977 on the reconstruction of a salt factory to have a capacity of 100,000 tons per year.

YEMEN ARAB REPUBLIC[22]

The mineral industry of the Yemen Arab Republic, involving the production of rock salt and cement, was an insignificant contributor to the country's expanding economy. The nation's financial stability was owing to approximately $1.0 billion in wages remitted by some 800,000 Yemeni emigrant workers, chiefly in Saudi Arabia. With this income and estimated exports of $19 million against imports of $730 million, the $711 million balance-of-trade deficit became a balance-of-payments surplus of nearly $300 million in 1977.

The Yemen Salt Mining Corp. resumed mining and export of rock salt from its mine on the coastal plain adjacent to the port of As Salif. A Canadian company examined the 68-hectare As Salif salt deposit in 1972. Its 33 drillholes, to an average depth of 100 meters, delineated total reserves of 250 million tons of rock salt with an average NaCl content of 98.23%. Minable reserves of 72 million and 115 million tons were estimated to depths of 50 and 80 meters, respectively. Mining was resumed in July 1977, and the shiploading facilities were tested and commissioned in August and September, when the first shipment of rock salt was made to North Korea against an order for 100,000 tons. In October, some 25,000 tons was shipped to Bangladesh. The mining rate was 10,000 to 12,000 tons per week,

Digitized by Google

and the shiploading capacity was 10,000 tons per day. The targeted capacity was 1 million tons per year from a 50,000-ton stockpile into ships of 50,000-deadweight-ton capacity.

The port of As Salif, protected on the west by the island of Kamaran, is reportedly one of the best natural deepwater harbors of the Red Sea. It was under consideration as the site for substantial development, including an oil refinery and a plant to manufacture chlorine, hydrochloric acid, and caustic soda from As Salif rock salt. Iraqi dredges and staff completed deepening and widening of port facilities at Al Hudaydah, but because of the narrow, 9-kilometer-long channel, there was only a slight reduction in harbor congestion at yearend.

Some 2,300 tons of gypsum was recovered from the As Salif rock salt deposit and sold to the cement factory at Bajil, 100 kilometers to the southeast. Gypsum deposits near San'a, Ta'izz, and Heirs were also probable small producers in 1977. The 50,000-ton-per-year cement plant at Bajil was operated at less than capacity, but plans for a 300,000-ton-per-year plant were outlined as part of the 1976-80 5-year plan published in November 1977.

A Kuwaiti firm started a route survey for an 8-inch diameter, three-product pipeline to be installed from the port of As Salif, up the 7,000-foot scarp to Ma'abir, south of San'a and Ta'izz, a total distance of 460 kilometers. The minimum estimated cost of the project was $300 million. Swedish, United States, Soviet, West German, Canadian, Romanian, and Chinese representatives have explored the mineral potential of the Yemen Arab Republic during the recent past. A team of Romanian geologists arrived in San'a on July 18, 1977, to examine the copper-cobalt-nickel prospects of Al Hamra and Al Shakat, some 40 kilometers southeast of Ta'izz. It subsequently reported the presence of a large deposit of marble near the road between Ta'izz and Mocha.

ECUADOR

Ecuador's gross domestic product (GDP) grew 8% despite a slowdown in production and sales of petroleum, the dominant economic sector. Crude petroleum exports, which amounted to about 35% of total exports in 1977, were valued at $484 million,[2] a decrease of 14% from 1976 values. Petroleum export sales were depressed because foreign buyers were somewhat uncertain that State-owned Corporación Estatal Petrólera Ecuatoriana (CEPE) held legal title to the oil until final settlement with Ecuadorian Gulf Oil Corp. In addition to the legal complication, Ecuador maintained a relatively high export price for oil until late in the year. There was also a shrinkage of traditional U.S. markets owing to the Alaskan pipeline becoming operational and an increased availability of Mexican supplies. The export market was also affected by increased domestic production in Peru and Chile, which lessened their import needs, and the pressure of greater competition from the Middle East in supplying crude oil to Caribbean refineries. About 20.4 million barrels or 40% of Ecuador's total crude exports went to the United States.

Only 27 wells were drilled in Ecuador during 1977; of these, 16 produced oil, 3 were dry holes, and 8 were suspended. About 31 wells were planned for 1978. Three new oilfields were discovered during 1977; two by CEPE in northeastern Ecuador and one by the Argentine State oil company Yacimientos Petrolíferos Fiscales (YPF), operating in Ecuador under a service contract. CEPE's two discoveries tested at 5,000 and 1,450 barrels per day, respectively. The YPF discovery tested at about 1,000 barrels per day. Ecuador altered its position regarding

Digitized by Google

CEPE's exclusive role in undertaking all exploration work, and it was announced that early in 1978 the Government would formulate a new oil operations contract that would be more attractive to foreign investors and thus encourage exploration activity.

The Government of Ecuador, CEPE, and Gulf executed an agreement which formally transferred to CEPE Gulf's 37.5% interest in the producing and pipeline assets owned by the CEPE-Texaco Inc.-Gulf consortium. Settlement included a provisional downpayment of $82 million with the balance of the net book value of Gulf's assets to be determined by a mutually acceptable independent European audit firm.

The small refinery retained by Gulf and the British-owned Anglo-Ecuadorian Oilfields Ltd. refinery, both located at La Libertad, were restricted to using Ecuadorean crude, and output declined. The newly constructed State-owned oil refinery at Esmeraldas came onstream and operated at about 60% capacity. This new refinery uses Ecuadorean crude. When operating at its full capacity of 60,000 barrels per day, the refinery is expected to provide for all domestic needs and to create a surplus for export.

CEPE and Texaco resolved their financial and operational differences with an agreement involving Texaco's share of the profits and participation in a new investment program. Ecuador increased overall income taxes from 71.4% to 87.3%, and Texaco's production royalties were increased from 17% to 18.5%, effective January 1977. These increases, although significant, were less than anticipated. The amounts would be calculated from quarterly averages of sales prices rather than from the posted or reference price. Other terms included dropping the fixed ratio of sales between CEPE and Texaco, dropping the fixed production cost and allowing periodic reassessments of actual costs, and a recision of Decree 285 which had fixed CEPE's share of production on the basis of 210,000 barrels per day assured total production regardless of actual production. The recision was retroactive to January 1977. For its part, Texaco agreed to a $31 million exploration and development program designed to improve recovery from existing fields and to explore for and develop new fields in the El Oriente Region. Texaco, as operator, agreed to provide $11.7 million to the new program, and CEPE will contribute the remainder. It was anticipated that this program will increase the proven reserves in the eastern oilfields to about 1.5 billion barrels. Texaco planned geological and geophysical surveys and the drilling of 10 exploration and 9 development wells during 1978.

Natural gas exploration in the Gulf of Guayaquil made minimal progress because of the inability of Northwest Pipeline Corp. and Ecuador to agree on economically feasible uses for the gas.

Cia. Ecuadoriana de Siderúrgica S.A. (ECUASIDER), the autonomous Government agency planning the construction of Ecuador's first integrated steelmaking facility, decided to locate its plant at Puerto Bolívar, near Machala. The 400,000-ton-per-year output of its one direct-reduction unit is to be used to produce a wide range of cast and rolled steel products. The plant is expected to become operational in 1982 and will use natural gas from the Gulf of Guayaquil.

Table 1.—Other Areas of South America: Production of mineral commodities

FRENCH GUIANA

There were no significant developments in the mineral industry of French Guiana during 1977. The Government maintained its policy of actively encouraging foreign participation in mineral exploitation. Minor quantities of gold, sand and gravel, and crushed stone were produced for local consumption. Esso Exploration Guyane S.A.R.L., in partnership with Eurafrep S.A., Soc. Shell de Recherches et d'Exploration de Guyane, and Soc. Nationale Elf Aquitaine, continued the offshore seismic studies begun during 1976 in the concession that adjoins their offshore holdings in Surinam. No drilling took place during 1977.

GUYANA

Despite austere import restrictions, Guyana ended the year with a total trade deficit of $55 million[3] which, although economically damaging, represented an improvement over the $84.5 million deficit accrued during 1976. Reduced world demand for calcined bauxite caused a 2% drop in shipments to 693,000 tons in 1977. Dried metallurgical-grade bauxite exports increased 6%, but alumina shipments were down. Guyana supplied about 97% of U.S. imports of calcined bauxite, which amounted to one-third of Guyana's total calcined bauxite exports.

The Government concluded a major reorganization of the bauxite industry whereby the two State-owned companies, Guyana Bauxite Co. Ltd. (GUYBAU) and Berbice Mining Co. (BERMINE), were merged into a joint company, Guyana Bauxite Mining Enterprise Ltd. (GUYMINE). GUYMINE will operate under a newly formed holding company, Bauxite Industry Development Co. Ltd. (BIDCO). Any new entities established to mine or process bauxite would also be under the supervision of BIDCO, which has the responsibility for expanding the bauxite industry and for providing common services to existing State mining operations.

Guyana began a feasibility study for a 150,000-ton-per-year aluminum smelter, expandable to 200,000 tons in the future. Ultimate development of the smelter is tied to the construction of the ambitious 750- to 1,000-megawatt hydroelectric scheme planned for the Upper Mazaruni River. Guyana continued to pursue the problem of obtaining adequate financing and technological assistance for these projects. In anticipation of the hydroelectric project development, the Government commenced construction of a 180-mile (293-kilometer) access road to the dam site, but late in 1977 budgetary problems forced suspension of work.

Progress continued on construction of an alumina calcining kiln near GUYMINE's alumina plant in Linden. The kiln, a Lurgi Fluid Bed Calciner, has a 290,000-ton-per-year capacity and is expected to result in a savings of 40% on the fuel cost of the conventional rotary kiln. Maintenance costs and alumina losses should be lower. Work is to be completed in 1978.

A feasibility study was planned for the development of a small, 3-million-ton, high-quality kaolin deposit at Ituni. The kaolin underlies mined-out bauxite deposits. Analyses of the material compare favorably with Georgia kaolin. The study would include the possible construction of a 140,000-ton-per-year plant to produce paper-coating and paper-filler grades for export. About half of the plant's capacity would be for refractory-grade kaolin for local consumption.

PARAGUAY

Paraguay's gross national product (GNP) rose about 12% in real terms during 1977; the major impetus came from the giant Itaipu Dam project being built in partnership with Brazil. Cement for the booming construction industry remained the major mineral product.

Reynolds Aluminum Co. of Canada Ltd. and the Government of Paraguay were unable to agree on power costs and other details for establishing an aluminum refinery, and negotiations were terminated. Anschutz Corp. continued its mineral exploration activities in eastern Paraguay and

Digitized by Google

planned to commence a drilling program in early 1978. Mineral possibilities are lead, zinc, copper, and nickel. Korea Electric Co. Ltd. of Seoul joined in partnership with Anschutz to prospect for radioactive minerals. Previous surveys reported that monazite containing 7.75% thorium and 870 parts per million of uranium was present in the tillite at Cerro Itappo near the Brazilian border. This occurrence was reportedly in pebbles believed to have been derived from the Caapucú area. The deposit was never developed.

Increased drilling activity in the Chaco region failed to result in any oil discovery. Chaco Exploration Co. remained optimistic regarding western Paraguay's hydrocarbon potential. It drilled two test wells in the northwestern Chaco region and planned further tests to evaluate its 4.1-million-acre area of interest. Texaco and Marathon Oil Co. each took a 25% interest in Esso Co.'s prospecting concession in the central Chaco Region. In northern Chaco, Texaco and Marathon began their wildcat program. One well had been drilled and one was in progress at yearend. The Esso-Aminoil Inc. partnership abandoned its deepest test to date in the southwestern Chaco Region. Trend Resources Ltd. made seismic studies on the eastern side of the Paraguay River. Trend holds a concession of about 7.5 million hectares and was reportedly seeking a partner. An area in northern Chaco was taken under an exploration contract by Piper Oil Co., a consortium formed by two U.S. companies, Samuel Gary and Webb Resources, Inc. Piper did not plan to drill in the coming year.

rRevised.

[1]In addition to the commodities listed individually, Paraguay reports the importation of "precious stones and metals" totaling 2 metric tons in 1975 and 2 metric tons in 1976.

SURINAM

The bauxite industry remained the mainstay of Surinam's economy and accounted for 85% of total exports during 1977. Exports of bauxite, alumina, and aluminum increased over those of 1976, but with the exception of aluminum did not reach their 1973 levels. Higher aluminum prices softened the economic impact on Surinam's balance of trade.

Surinam continued its determined effort to develop its western bauxite deposits in the Bakhuis Mountains near the Corantijn River. N.V. Grassalco, a State-owned company, actively sought foreign participation for this ambitious mining-refining project. Bauxite reserves in the area were estimated to be 50 million tons grading at least 42% alumina. Another group of deposits farther south has also been investigated. Financial arrangements and any outside participation in the project were not finalized. Construction continued on the 75-kilometer railroad that will connect the port of Apoera on the Corantijn River to the Bakhuys Mountains

Digitized by Google

mining area. Feasibility studies were completed for the construction of a 575,000-ton-per-year refinery at Apoera to process most of the Bakhuis Mountains bauxite.

Financing for the Kabalebo hydroelectric project was provisionally secured during 1977. The project construction is crucial to western Surinam's development plans. The Kabalebo project would initially consist of a 500-megawatt power station at Devis Falls on the Kabalebo River, to be followed by a 300-megawatt station at the Kabalebo airport and by a third, as yet unidentified, station.

Although hydrocarbons have never been found in Surinam, two companies planned to initiate exploration activity. A Venezuelan company, Las Mercedes de Petrolera, acquired an exploration contract covering 500 square miles off the northeastern coast of Surinam's Saramacca District. Esso Petroleum Surinam N.V., working with its partners, Eurofrep, Shell Surinam N.V., and Elf Petroleum Surinam N.V., planned to begin exploratory drilling about 70 miles off the coast of Surinam near its sea boundary with French Guiana.

Table 5.—Surinam: Exports of aluminum, by type[1]

(Metric tons)

Type	1975	1976	Principal destination, 1976
Bauxite	2,170,031	1,913,956	United States 1,601,454; Denmark 90,061; West Germany 39,229; Canada 13,703.
Alumina	1,056,368	811,348	Norway 287,255; United States 190,921; Netherlands 186,253; United Kingdom 95,656.
Aluminum metal including alloys, all forms	25,039	44,026	United States 20,940; West Germany 10,709; Italy 4,891; United Kingdom 4,807.

[1]Compiled from official import statistics of trading partner countries.

URUGUAY

Uruguay continued its efforts to overcome the effects of petroleum import costs. Expectations diminished when Chevron Oil Co., after drilling two dry holes in 1976, reassessed prospects and contractual obligations and decided to relinquish its 10,000 square miles of offshore holdings. The contract required Chevron to drill four wells with the option of paying a $1.5 million penalty per undrilled hole. The Administración Nacional de Combustibles, Alcohol y Portland (ANCAP), the State-owned entity responsible for hydrocarbon activity, continued its oil exploration program in the Santa Lucía River basin near Montevideo. ANCAP contracted for 870 line miles of offshore seismic survey in preparation for the startup of exploration drilling.

The French Bureau de Recherches Géologiques et Minières (BRGM) completed a preliminary survey of mineral prospects in Uruguay. The survey indicated the presence of gold, manganese, copper, lead, and zinc in the southwest border region and in the Department of Rivera. A French delegation conferred with the Government and local mining interests regarding possible development of these resources.

A feasibility study was undertaken to determine the potential of a 30-million-ton iron ore deposit at Arroyo Valentín in the northeastern part of the Department of Florida. The iron ore deposit would be used to supply a projected $140 million iron and steel complex which could make Uruguay self-sufficient in basic steel products and also supply iron ore pellets for export purposes. Previously worked gold properties in northern Uruguay have now been acquired by Pavonia S.A. A 1976-77 sampling and mapping survey was completed, and drilling was planned.

Christmas Island	1234	New Hebrides	1240
Fiji	1235	Papua New Guinea	1241
Nauru and Ocean Island	1238	Tonga	1243

BRITISH SOLOMON ISLANDS

The only reported mineral production in 1977 was small output of alluvial gold, valued at an estimated $54,320.[2] In addition, marine shells are gathered for use in lime manufacture, although output was not reported.

Proposed development of a bauxite mine and smelter, involving Rennell and Vaghena Islands, was deferred in June. Conzinc Riotinto of Australia Ltd. (CRA), in partnership with Mitsui Mining & Smelting Co. Ltd., and the Solomon Government, withdrew from the project, and Mitsui, which conducted a feasibility study and metallurgical testing of the bauxite, decided to defer further work because of slack demand for aluminum in Japan and difficulties in arranging financing. The Mitsui feasibility studies reportedly indicated that the project could be viable despite technical difficulties and relatively high initial investment costs. The project was to produce 1.5 million tons of bauxite and 600,000 tons of alumina per year from reserves totaling 60 million tons at 45% to 50% Al_2O_3.

FIJI

The Dominion of Fiji's principal mineral products were gold, construction materials, and cement. Reported total value of mineral output in 1977 was $18.3 million.[3]

Output of cement, and coral sand was substantially higher, but gold and silver production from Fiji's one operating gold mine was down from that of 1976.

A number of United States, British, Australian, and Japanese mining interests conducted exploration projects during the year. Significant mineral discoveries were announced, but there were no new mines under development. At yearend, 33 prospecting licenses covering 544,984 acres and 3 mining leases covering 2,988 acres were in effect.[4]

The Seventh Development Plan, initiated in 1976, provided for an expanded mineral resources program conducted by the Ministry of Lands and Mineral Resources, Mineral Resources Division. This program included regional geological mapping, economic and environmental studies in potential mining areas, ground-water assessment, offshore geological and geophysical studies, work on geothermal potential in hot springs areas, administration of the Mining, Quarries and Explosives Acts, and liaison with private mining companies.

In the private sector, a number of exploration projects on Viti Levu and Vanua Levu, the largest islands, reached the drilling stage. Amax Exploration (Australia) Inc. was conducting a 15,000-meter drilling project in the upper Waidina River area, 32 kilometers west-northwest of Suva.

Amoco Minerals Fiji Ltd. was drilling several prospects in southwestern Viti Levu. United States Steel International Inc., with associates, was active in the Mouta and Natewa areas. Aquitaine Fiji Ltd. planned further work in the Sambeto Range and was drilling a prospect in the Tawaravu Creek area.

COMMODITY REVIEW

Metals.—*Copper.*—Road building, drill site preparation, environmental impact studies, and exploration drilling were underway at the large, low-grade porphyry copper deposit at Namosi on Viti Levu, where preliminary estimates indicated an ore body of 400 million tons at 0.4% to 0.5% copper. In September, CRA, through its subsidiary Copper Resources (Fiji) Ltd., joined the operating consortium, which also included RST (Fiji) Inc. (exploration manager and a subsidiary of Amax Exploration

(Australia) Inc.), Anglo Pacific (Namosi) Ltd. (a subsidiary of Australian Anglo American Ltd.), and Preussag (Fiji) Ltd. of the West German Preussag Group.

Gold.—Mining operations of Emperor Gold Mining Co. Ltd. at Vatukoula were at a rate similar to those of 1976, although gold recovery was lower because of reduced millhead grades. Ore production was as follows, in metric tons:

Ore source	Quantity
Stopes	229,190
Development	19,605
Open pit	28,032
Total	276,827

Millfeed totaled 277,864 tons at an average millhead grade of 0.23 troy ounce per ton. Production delays were caused by shortages of chemicals and spare parts and labor problems. A new flotation circuit, using soda ash, went into operation.

Early in the year, Emperor Gold Mines considered closing the Vatukoula mine owing to continued financial losses during a period of low gold prices, inflated costs, and labor unrest. In order to keep the mine, which employed 1,500 Fijians, in operation, the Government granted financial assistance in the form of tax relief and interest-free loans. In October, Emperor reported a loss of $1.5 million during the fiscal year ending June 30, 1977. In November, the Government acted to advance all losses for 28 months from March 1, 1977, as loan funds to a maximum of $2.28 million, which would be repaid out of future pre-tax profits. At yearend, losses were still incurred because of slipping millhead grades, although the gold price was rising. The company considered that a cutoff grade of 0.33 troy ounce per ton would be necessary to maintain a viable operation. The Government was undecided about further financial support and was considering purchase of the mine.

Nonmetals.—Emperor operated the limestone quarry at Tau for the production of burnt lime but did not report limestone production. In 1977, 17 sand and gravel licenses were granted, an increase over that of 1976, although licensing was disrupted by the need for new procedures to determine compensation for damages to fishing grounds.

Fiji Industries Ltd. dredged 107,861 tons of coral sand from Suva harbor and 41,494 tons of common sand and gravel from the Rewa River and its tributaries.

The Government's Mineral Resources Division completed a drilling project on a phosphatic clay deposit on the island of Tuvutha and reported resources of 1.5 million tons containing 10% P_2O_5.

Mineral Fuels.—*Petroleum.*—Offshore petroleum exploration licenses were granted to Dakota Exploration (Fiji) Ltd. for 7,800 square kilometers and to Pacific Energy for Minerals Ltd. for 7,460 square kilometers.

Principal imports of petroleum refinery products in 1977 were as follows (in thousand barrels): Motor gasoline, 459; aviation turbine fuel and kerosine, 848; distillate fuel oil, 1,350; and residual fuel oil, 173. The principal sources of these petroleum products were Australia and Singapore.

NAURU AND OCEAN ISLAND

Shipments of high-grade phosphate rock from these two islands, which are about 300 kilometers apart near the Equator and have similar phosphate deposits, were higher than those of 1976. Shipments by Nauru Phosphate Corp. from the Republic of Nauru, the larger producer by far, rebounded from the slack 1976 year, and increased by 52%. Deposits on Ocean Island, which was administered as part of the Gilbert Islands, were expected to be depleted in or near 1980.

NEW CALEDONIA

Mineral production was limited to the mining and smelting of nickel to matte and ferronickel, byproduct cobalt from the nickel operations, chromite, and certain pit and quarry construction materials. Exports of nickel ore, matte, and ferronickel provided important revenues to the New Caledonian economy.

Mine output of nickel ores by Société Métallurgique Le Nickel (SLN) was down slightly from that of 1976 and substantially below the peak output attained in 1974. Exports in 1977 were valued as follows, in thousand dollars: Ore (to Japan), $71,857; matte, $91,877; and ferronickel, $130,809.[5] The average export ore grade was 2.39% nickel. The Doniambo smelter at Noumea operated at about 70% of capacity; the idle capacity was mainly for ferronickel. Despite this idle capacity, SLN continued to plan a $200 million smelter capacity expansion from the current 85,000 tons of nickel per year in matte and ferronickel and to 100,000 tons per year, mainly by improvements in ore preparation and calcining. This project was scheduled for completion in 1981.

Nickel ore for domestic smelting and for the export market was produced at four major centers—three (Thio, Kouaoua, and Poro) near the east coast and one (Nepoui) near the west coast. Expansion continued at the Népoui mine, the largest producer, to 2 million tons of ore per year and at Kouaoua to 1.2 million tons per year.

Amax Nickel Inc. acquired a 49% interest, following negotiations with Bureau de Recherches Géologiques et Minières (BRGM), the French Government-controlled agency, which held 51%, in a $600 million, fully integrated nickel project in the Tiébaghi, Poum, and Isle Art regions at the northern end of New Caledonia. Initially, smelter capacity would be 40,000 tons of nickel per year. Reserves of 55 million dry tons of ore at 2.5% nickel in garnierite, including 10 million tons at 3% nickel, would be mined at a rate of 1 million tons per year. Amax was interested in shipping this smelter nickel to its Port Nickel refinery in Louisiana.

In an agreement concluded with BRGM, International Nickel Co. of Canada Ltd. (INCO) will conduct a 5-year feasibility study on laterite development for nickel in the southern part of the island. INCO would be required to take a French partner before the development stage.

Energy requirements were considered a potential problem since New Caledonia had no domestic energy resources. Imported fuel oil was the principal industrial source of energy. The Plaine des Lacs region was considered to have some potential for hydroelectric development.

Production of chromite, containing 39.5% Cr_2O_3, in the Tiébaghi area was 13% below that of 1976. Chromite exports, mainly to Japan, were valued at $276,000. Société de la Tiébaghi, a subsidiary of INCO and the operating company, drove an adit to the mineralized zone and was conducting a drilling program. BRGM studied chromite prospects in peridotite rocks along the southern coast.

NEW HEBRIDES

Production of manganese concentrate, New Hebrides' only reported mineral product, dropped off markedly from 1976 output. The mine, located at Forari, 55 kilometers northeast of Port-Vila on Efate Island, was operated by Le Manganèse de Vate (LMV), owned by Southland Mining Ltd. of Australia (87.5%) and public shareholders (12.5%). This company had 110 employees, largely native New Hebrideans, and shipped a 40% to 42% manganese concentrate of metallurgical grade under contract to Japan. The market value was US$35 per ton for a 40% manganese product. The ore was mined by a bulldozer, a 2-1/2-cubic-yard dragline, and a 7-cubic-yard front-end loader, and was hauled by truck to a concentrator, where the ore was crushed and washed to separate coral and clay.

Although manganese concentrate is the only mineral for which production is reported, other mineral resources were worked or were under investigation.[6] Samples of large deposits of pozzolan, a consolidated volcanic ash, on Efate and other islands were shipped from Forari to Australia and Fiji to test for use in cement. Coral

Digitized by Google

reef limestone and sand and gravel were used in roads, other public works, and buildings. Known sulfur resources occur on Vanua Lava. Metallurgical limestone, copper, and zinc were studied on Santo Island; and beach sand deposits containing magnetite, ilmenite, and other ore minerals were under review on Pentecost Island. There was interest in offshore exploration for petroleum and seabed metallic nodules.

According to the Service des Mines et de l'Hydrologie, eight parties held valid authorizations for mineral prospecting at yearend. These included the BRGM, Kennecott Explorations (Australia) Ltd., Southland Mining, Melanesia Exploration Ltd., CRA Exploration Pty. Ltd., and private individuals.

PAPUA NEW GUINEA

Principal mineral products in Papua New Guinea were copper, gold, and silver. Except for relatively small output at another gold mine, these metals were in copper concentrates from the Panguna open pit on Bougainville Island. They contributed significantly to Government revenues and the gross domestic product (GDP). Values of 1977 output were: Copper, $149 million; gold, $108 million; and silver, $6 million,[7] together making up nearly 17% of the GDP, estimated at $1,563 million in fiscal year 1977 (ending June 30, 1977). Copper's share of the GDP was reduced to 9.5% from 19.1% in fiscal 1976, owing to an expanding GDP and a lower copper sales value.

A number of promising porphyry copper prospects were under investigation, following agreements with the Papua New Guinea Government. Some of these copper deposits contained potentially byproduct gold, silver, and/or molybdenum. Exploration was also underway for chromite and nickel, and an international consortium was drilling for offshore and onshore oil.

The National Investment and Development Authority (NIDA), Central Planning Office, which was set up in 1973 to promote foreign investment, announced a 5-year National Expenditure Plan to define development objectives beginning in 1978. Three agreements had been negotiated—with Bougainville Copper Ltd. (BCL), the OK Tedi Development Co. Copper Project consortium, and U.S.-based oil companies for petroleum exploration.

The Mineral Resources Stabilization Fund was also established. All income from mineral resource development would enter this fund, which would provide for budget revenues.

Late in the year, the Government introduced a White Paper on mining policy, defining tax and other financial terms for mining operations, as a forerunner of legislation to be presented to the Parliament in 1978. The proposed legislation would be based on provisions of revised agreements for the Bougainville copper, OK Tedi copper, and petroleum exploration, which would not be affected by new legislation enacted in 1978. The new financial policy would involve a Government equity, royalty on sales, a withholding tax, and a profits tax on high return on investment. In turn, the Government would guarantee free convertibility of its currency for payments overseas; freedom from imposts, discriminatory taxes, and import duties; and assistance in infrastructure development.

COMMODITY REVIEW

Metals.—*Chromite.*—Amax Exploration (Australia), a subsidiary of Amax Inc., concluded an exploration agreement with the Papua New Guinea Government for chromite and other minerals in beach sands along the Morobe coast, between Salamaua and Salua. Preliminary estimates indicated reserves of 200 million tons of mineralized sands containing 1.5% chromium.

Copper.—Output of concentrate at the Panguna mine of BCL Bougainville Island was higher than that of 1976, but sales revenue was lower at $264 million, compared with $270 million in 1976; net earnings were also reduced to $37.1 million from $53.8 million in 1976. The losses in revenues and profits were attributed to a slump in the copper market price and rising costs. A total of 34.1 million tons of ore was milled at an average millhead grade of 0.61% copper. During the first half of the year, the millhead grade fell from 0.64% to 0.60% copper owing to a harder, lower grade ore-type mined.

In March, BCL announced a $50 million development program, including a $12.3

Digitized by Google

million, 7-kilometer tunnel, a 10th ball mill, and new, larger, 170-ton electric-wheel-drive trucks for ore haulage. The tunnel was planned to drain the open pit, which flooded during the monsoonal season, and eliminate drainage pumping. The new ball mill, which went onstream in May, increased mill capacity by 10%.

Panguna ore reserves, as of August 1977, were 900 million tons at 0.48% copper.

OK Tedi is a Government organized company for managing the work program at the OK Tedi Copper Prospect, which is located at Mount Fubilan in the remote rain forest of the Star Mountains, near the Irian Jaya border, at an elevation of 2,070 meters. Interests in the company were as follows: Dampier Mining Co. Ltd. (a subsidiary of BHP Co.) 30%; Mount Fubilan Development Co. Pty. Ltd. (a subsidiary of Amoco Minerals Ltd.) 30%; Kupferexploration GmbH (Federal Republic of Germany) 20%; and the Papua New Guinea Government, 20%. Stage 2, started in late 1976, called for submittal of a $10 million feasibility study and proposed work program, including mine development, a townsite, infrastructure, and port facilities, to the Government in 1979, following which a decision would be made on proceeding with development. Stage 2 exploration drilling was near completion at yearend, and Stage 3 drilling was planned. An ore reserve target of 250 million tons at 0.85% copper was considered necessary for a viable commercial operation, which would require a capital investment of more than $700 million. In May, 270-meter and 540-meter adits were being driven on an around-the-clock, 7-day-a-week basis, to test the ore at two levels. The upper adit was designed for sampling a gold-bearing capping zone.

A number of other copper prospects were under investigation. The Frieda prospect in Western Sepik Province was the subject of a feasibility study by Frieda Exploration Pty. Ltd., operator for Overseas Mineral Resources Development Co., a Japanese group. This group managed a 4-year exploration project, scheduled for completion in 1978, and may earn a 40% interest in the share of M.I.M. Holdings Ltd. As a result of continued exploration, reserves increased to 500 million tons at 0.50% copper, as of June 1977.

Dampier dropped out of a consortium studying the Yandera copper-molybdenum prospect in Madang Province. The operating company, Amdex Mining Ltd., comprised Triako Mines N.L. and Buka Minerals N.L., together holding 61%, and Kennecott Explorations (Australia), with 39%. As a result of continuing exploration drilling, ore reserves were increased to 338 million tons at 0.40% copper.

On Manus Island, 360 kilometers north of the Papua New Guinea mainland in the Admiralty Islands Group, joint venture exploration by Exoil N.L. and Transoil N.L. indicated 160 million tons of ore at 0.32% copper, associated with gold, silver, and molybdenum, in one of several known prospects. These copper prospects had advantages in lower estimated development costs because of relatively good accessibility compared with mainland deposits.

In April, the Office of Minerals and Energy announced invitations to competitive bids for prospecting rights to the Tifalmin area, near the OK Tedi deposit. Any agreement would be with the Government's OK Tedi consortium and would require a $4.5 million exploration expenditure in 2 years.

Gold and Silver.—Gold continued to be an important byproduct at BCL's Panguna copper mine where gold recovery was important to the mine's viability. Gold sales totaled 718,023 troy ounces, down from that of 1976, from ores containing an average of 0.018 troy ounce per ton. Byproduct silver recovery was also lower.

New Guinea Goldfields Ltd., an Australia-based company, produced relatively small quantities of gold at Wau, where ore averaged 0.08 troy ounce per ton. The OK Tedi Copper Prospect was reported to contain 0.025 troy ounce of potentially recoverable gold per ton.

Mineral Fuels.—*Petroleum.*—In petroleum exploration, Esso Papua New Guinea Inc. drilled one offshore well in the Gulf of Papua and planned another well in the Fly River Delta area. Esso was operator for a joint venture also including Arco Australia Ltd., Australian Superior Oil Co. Ltd., Canadian Superior Oil (Australia) Pty. Ltd., and Sunray Australian Oil Co. Inc. The Papua New Guinea Government had an option for a direct interest of 22.5% in any potential commercial discovery. In April, Esso terminated an unsuccessful well in the Gulf of Papua, near Daru, at 3,434 meters, and planned to shift to the Fly River Delta area following seismic work there.

Legislation was passed, setting the basis for agreements between foreign petroleum companies and the Papua New Guinea Government on petroleum exploration. Ac-

cording to an agreement negotiated with seven U.S.-based oil companies, the Government would receive 60% to 80% of any future revenues from oil or gas production, a 1.25% royalty based on wellhead values, a petroleum income tax of 50% of taxable income, a profits tax after an agreed rate of return is achieved, and a Government equity up to 22.5% with payment from the Government's share of production.

TONGA

Webb Tonga, a subsidiary of Webb Resources of Colorado, a U.S. independent oil company, planned a drilling program for oil onshore and offshore of Tongatapu, the island center of the Kingdom of Tonga. Webb Tonga was granted a lease and conducted a seismic survey in 1976, applied for and received an extension to its concession in 1977, and planned drilling for oil in 1978.

[1]Supervisory physical scientist, Branch of Foreign Data, (now retired).

[2]In October 1977, the Solomon dollar ($S) was introduced, initially on par with the Australian dollar. Where necessary, values have been converted to U.S. dollars at a rate of $S1 = US$1.11, the exchange rate of the Australian dollar.

[3]Where necessary, values have been converted from Fijian dollars (F$) to U.S. dollars at the rate of F$1 = US$1.14.

[4]Report of the Mines Section, Mineral Resources Division, Ministry of Lands and Mineral Resources, for the year 1977, Suva.

[5]Where necessary, values have been converted from Communauté Financière Pacifique Francs (CFPF) at a rate of CFPF89.11 = US$1.00.
